LITERATURE.

The Letter Books of Sir Amias Poulet, Keeper of Mary Queen of Scots. Edited by John Morris, Priest of the Society of Jesus. (London: Burns & Oates, 1874.)

IN April 1585 Mary Queen of Scots was delivered into the custody of Sir Amias Poulet, and he continued to be her keeper until her execution in February 1587. His predecessor in that onerous post, Sir Ralph Sadler, had been censured, more than once, for his indulgent treatment of his prisoner, and Poulet was no doubt selected as a jailer who was not likely to err on the same side. Through the influence of the Earl of Leicester he had, in the year 1576, been appointed ambassador in France. He occupied that post for three years, and, like his powerful patron, he had during his embassy professed the strictest Puritan principles, and displayed the most rooted hostility to the princes of Jorraine, as well as to their kinswoman the Queen of Scots. She, well knowing the antecedents of her new keeper, naturally regarded him with suspicion and distrust, while it is obvious from his correspondence that from first to last he never ceased to look upon her as the mortal enemy both of his creed and his sovereign. A great portion of that correspondence is to be found in the Record Office, and has been freely referred to by recent historians; but in the volume before us are published for the first time a number of letters of Sir Amias which were preserved by his descendants, and are now deposited in the Bodleian Library. Many of these are highly interesting, and Mr. Morris has done good service to the cause of historical truth in placing them before the public.

Sir Amias Poulet became the keeper of the Queen of Scots at a very critical period in the life of that unhappy princess. The negotiations set on foot for restoring her to liberty had been finally broken off through the greatest of all the misfortunes that had yet befallen her—the base desertion of her son. She was in miserable health, and from the increased vigilance and severity of her keepers it was plain that Elizabeth's ministers had now determined that she should never leave her prison alive. They knew that, in spite of the desertion of her son, she still had numerous and powerful partisans in England. They knew, moreover, that although France, or to speak more accurately Catherine de Medici, was indifferent to her fate, Philip and the Prince of Parma were steadily preparing to strike their long-meditated blow for her deliverance. Burghley, Leicester, and Walsingham had now made up their mind that she should remain a prisoner for life, and the instructions which Poulet received before entering upon his duties very clearly indicate the spirit

which at this time animated Elizabeth's chief advisers:—

"You shall order," say the instructions of Walsingham, "that she shall not in taking the air pass through any towns, nor suffer people to be in the way where she shall pass, appointing some always to go before to make them to withdraw themselves, for that heretofore, under colour of giving of alms and other extraordinary courses used by her, she hath won the hearts of the people, &c." (p. 6).

In consequence of these instructions Mary was, immediately on Poulet's arrival, prohibited from distributing her customary charities to the poor. She naturally complained to Elizabeth of this fresh piece of tyranny, but her remonstrances were vain. It was in vain, too, that she complained of the damp unwholesome state of Tutbury Castle, where she was at this time confined. It was not until the close of the year 1585 that, through the intervention of the French Ambassador, she was allowed to remove to Chartley, a residence of the Earl of Essex, in the same county. Shortly after her arrival at this place her keeper received a mysterious visit from a person named Thomas Philipps, who acted a very important part in the tragedy which was soon to follow.

This Philipps was a "decipherer" by profession, and we have abundant proof that he was also a most expert forger. He was at this time concerting measures with a miscreant named Gilbert Gifford, a Catholic and a pretended partisan of the Queen of Scots, for intercepting the whole of her correspondence. And they succeeded so well, that from about the middle of January till the middle of July every letter that passed to or from the Scottish Queen or her secretaries, fell into their hands. During this interval an extensive correspondence was carried on between her and her friends both in England and in France, and it is a very significant fact that of the numerous letters intercepted by Gifford and Philipps, and now preserved in the Record Office, only one contains matter implicating her in the plot against Elizabeth's life. This letter was obtained, after a second visit of Philipps to Chartley, in July 1586, and that it has been tampered with we have evidence as strong as the nature of the case will admit; that it contains a fabricated postscript, which is still extant in the Record Office, is also certain. Mr. Froude has attempted to explain why this damning document was not produced by Mary's accusers at Fotheringay, but the answer of Mr. Morris is simple and conclusive, pp. 239-242.

Poulet was the only one of Mary's keepers who regarded her from first to last with avowed hostility. With his various predecessors, Sir Francis Knollys, Lord Scrope, Lord Shrewsbury, and Sir Ralph Sadler, she lived on as amicable terms as under the circumstances were to be expected. But Poulet invariably treated his prisoner with severity, and even at times with unpardonable rudeness. He himself describes a characteristic conversation between them respecting a granddaughter of Lady Shrewsbury, who had been brought up and educated by Mary from her childhood. Poulet informed her one day, without any previous notice, that the father of the young lady,

Sir Henry Pierpoint, had sent for her, and that she must return home forthwith.

"It had been reasonable," said Mary, "I should have been advertised in time convenient to have prepared all things necessary for the young gentleman."

She added that, in consequence of her tailor having been hurt, her wardrobe was incomplete:—

"I answered," said Poulet, "that it was well known that she was not unprovided with sufficient clothes, and that she went from hence to her father's house, where she was no stranger."

"I must tell you," said this Queen, "that she is unprovided of smocks, which are now in making, and she may not want them."

"Madam," quoth I, "one smock is sufficient to bring her home," &c. (p. 204).

To end the controversy, the young lady was sent for, and she declared that she would do nothing contrary to Mary's wishes. "Then I told her," said Poulet, "that I could not draw her out of her mistress's chamber by force." He, accordingly, retired to give vent to his chagrin in a long letter to Walsingham, in which he left "these women's causes" to his better consideration. We may observe that the influence which Mary, at every period of her life, possessed over her own sex was very remarkable; of this we have another curious example in the correspondence before us. It is well known that a certain brewer of Burton, whom they termed in derision "the honest man," and who brought a weekly supply of beer to Chartley Castle, was the instrument employed by Gifford and Poulet to intercept Mary's letters. But he durst not tell his wife that he was playing the part of traitor to the Scottish Queen. The good woman believed that, as he was most liberally rewarded by Mary for his services, he was acting honestly on her behalf, and she always spoke of her as "her husband's mistress," p. 190.

After sentence of death had been pronounced upon Mary in the Star Chamber, upon the evidence of a letter said to have been deciphered by Philipps, but of which the original never was produced, and the authenticity of which Philipps himself never attested, Sir Drue Drury was sent to assist Poulet in his task of watching the Scottish Queen. She had now been removed to Fotheringay, where it had been determined that the sentence should be executed. But four dreary months elapsed before Elizabeth could be induced to give the fatal order. Poulet, impatient of the delay, never ceased to urge upon Walsingham the necessity of taking his prisoner's life. From the correspondence now published we learn that he even took upon himself to keep back for many weeks Mary's last letter to Elizabeth, a composition of its kind unsurpassed in history. He dreaded its effect upon the fickle mind of Elizabeth, and justly so, for we learn from Leicester that it "wrought tears" when it finally reached his mistress. But Elizabeth was surrounded by men who had determined that the Scottish Queen should die. She made a last attempt to avoid the odium that she knew would attach to her for consenting to Mary's death by attempting to persuade Poulet to assassinate her. But he was too wary to fall into the

snare; and she finally signed the warrant, and then imprisoned and ruined Davison for having it executed.

Sir Drue Drury appears to have at times displayed some natural sympathy for his prisoner; but we perceive no abatement in the hostility of Poulet. In a long letter to Walsingham he describes an interview which he had with her a few weeks before her execution, in the course of which he and his colleague thought fit to taunt her with her *ingratitude* to Elizabeth. We give her reply in Poulet's own words:—

"What shall I acknowledge?" saith she. "I am free from the world, and therefore am not afraid to speak; I have had the favour to have been kept here prisoner many years against my will." "Madam," quoth I, "this was a great favour, and without this favour you had not lived to see these days." "How so?" saith she. I said her own subjects pursued her, and were the stronger in her own country. "That is true," quoth she, "because Mildmay persuaded me to discharge my forces, and then caused mine enemies to burn my friends' castles and houses" (p. 333).

Mary here referred to her negotiations with Cecil and Sir Henry Mildmay, the Chancellor of the Exchequer, who persuaded her in 1570 to disband her forces in Scotland on the pretext that she was about to be restored to liberty.

"I told her, however," continued Poulet, "it was great personages of that country had made earnest suit to her Majesty to have her delivered unto them, which her highness (Elizabeth) refused, to their great dislike."

Poulet here referred to the secret negotiations for the delivering up of Mary to the Regent Mar in 1573, and of which she probably now heard for the first time. But instead of refusing to give up Mary to the Regent, it is certain from Henry Killigrew's letters, which still exist, that the scheme was devised by Elizabeth and her ministers, who were willing to send the Scottish Queen back to Scotland provided her subjects would undertake to murder her. It was only through the sudden and unexpected death of the Regent that this atrocious scheme was abandoned.

Sir Drue Drury here took occasion to remind Mary that Elizabeth had sought to preserve her honour as well as her life:—

"Wherein?" said she; he answered, in the commission of her causes, sitten upon at York, which was dissolved at the instance of her friends to save her honour. "No," quoth she, "the cause of the dissolving of the commission was that my friends could not be heard to inform against my accusers."

In this view of the matter Mary is corroborated by the Earl of Sussex, who was one of Elizabeth's commissioners at York. After the famous Casket-letters had been privately exhibited to that nobleman and his colleagues, he informed Cecil that he did not think Mary's enemies would venture to proceed with the inquiry—

"for," he says, "if her adverse party accuse her of the murder by producing of her letters, she will deny them and accuse the most of them of manifest consent to the murder, hardly to be denied; so as upon the trial on both sides, *her proofs will judiciously fall best out, as it is thought.*" (1 Lodge, 458.)

In further confirmation of this view, Mary demanded that Murray should be detained at

Westminster to answer the accusations she had to prefer against him; but he was sent back to Scotland in indecent haste on the pretext that his presence was required there.

To return to Poulet's letter. He once more sought to impress her with a sense of the deep obligations she owed to Elizabeth:—

"It is a great favour," said she, "to have kept me here many years against my will." I said it was for her safety, and that her countrymen sought her destruction, and to that end required to have her delivered unto them, as was said. "Nay," saith she, "then I will speak, I am not afraid. It was determined here that I should not depart, and my Lord Treasurer, when I was demanded by my subjects, wrote in a packet to the Earl Murray (which was intercepted and brought to me), that the devil was tied fast by a chain, and that they could not keep her, but she should be kept safely here."

That this was Burghley's view of the case there cannot be a doubt. From the moment that Mary set foot in England, he appears to have made up his mind that here she should remain.

Mr. Morris has both ably and honestly performed his duty as editor of these interesting letters. He is thoroughly acquainted with the history of the period, and in addition to the correspondence of Poulet, he has printed a number of original papers from the Record Office. One of these is a letter from Gifford to Philipps, which it is surprising should have been preserved. In this strange document Gifford in the plainest terms asks Philipps to forge two letters, one to Thomas Morgan, Mary's agent in Paris, and another from Edward Windsor to Charles Paget, a brother of Lord Paget, for the purpose apparently of luring him to England that he might be arrested for his alleged complicity in the Babington conspiracy. Edward Windsor was the only one of Babington's friends who managed to escape. Whether or not Philipps forged these two letters in accordance with the directions of Gifford we do not know; but that he forged other letters we know from the confession of Philipps himself. Gifford eventually played false to his employers, for in a letter from Sir Edward Stafford, Elizabeth's ambassador in France, to Walsingham, written a few months after Mary's execution, he calls him "the most notable double-treblevillain that ever lived" (p. 383). It is not surprising, under the circumstances, that although Mary was condemned and executed solely upon evidence produced by these two men, Gifford and Philipps, the name of neither is to be found in the report of her trial published by Lord Burghley.

Mr. Morris is very careful in general in citing his authorities, but we observe one instance in which he has failed to do so. It is well known that for a month or two before Mary's death Walsingham absented himself from court. Mr. Morris alleges as the cause, his disappointment that he did not obtain Babington's estates, which were bestowed on a new and rising favourite, Sir Walter Raleigh (p. 341). But no authority is given for this statement. Though notoriously unscrupulous in his public conduct, Walsingham appears to have been neglectful of his private interests, for while most of his colleagues amassed great fortunes, he died a poor man.

JOHN HOSACK.

Waldfried. In Three Volumes. By Berthold Auerbach. (Stuttgart: Cotta. London: Sampson Low & Co., 1874.)

In organic periods of history men's passions determine their actions, and their opinions are a *catalogue raisonné* of the practical workings of their strongest passion under the inevitable conditions imposed by past events. The familiar disparagement of "blind passion" as a political force expresses the natural disposition of a critical age to see stupidity, if not immorality, in action that has not been consciously brought into harmony with the general mass of permanent abstract belief and hereditary indifferent conviction which enthusiasm is apt either to ignore, or, in its turn also, to denounce as mechanical, soul-destroying, and, under the circumstances, impotently stupid. It would be easy for criticism to show that the opinions of Herr Waldfried (the autobiographer in Auerbach's last *Vaterländische Familiengeschichte*) have nearly every intellectual vice that sincere opinions can; they are not reached by reason, but by a long series of passive experiences in which the main function of the reason has been to abdicate in the face of insoluble difficulties; they are not maintained by reason, but by a number of concrete assumptions (many, of course, relating to the moral turpitude of a neighbouring nation) which are inadequate to support any sound political generalisation at all, and stand in no known logical relation to the concrete inferences for the sake of which they appear to have been made; they are untempered by any rational diffidence, by any reference to the chronic fallibility of the human judgment, any allowance for the errors of human observation, or the bias of passionate inclination. And, accordingly, *Waldfried* is a very instructive, almost a monumental work. Circumstances have been too strong for the author; and, instead of the book that he meant to write—an ordinary *tendenz Roman* in praise of German unity—he has given a revelation, all the fuller and more faithful because unintentional, of the causes at work to produce that temporary suspension of the reasoning and critical faculty among German men of letters in the late war which appeared so unaccountable to the cultivated scepticism of other countries as to suggest the unwarranted suspicion of hypocrisy.

The story is slight. The narrator, Waldfried, is a native of a South German state, in which minute administrative tyranny had generated the habit of evading the demands of the law, as far as possible; in his youth he had belonged to the party of progress, and was imprisoned for some years in a fortress. After his release he married and began to keep his opinions to himself: his eldest son, Ludwig, adopted extreme views and fought upon barricades in '48, and then emigrated to America; another son, Richard, is a professor; the youngest, Ernst, is a source of anxiety to his parents because he respects nothing, and in 1865 they were not quite decided in their own mind as to what they wished him to respect. The father retained a sentimental, metaphysical attachment to the ideals of his youth, though he had in effect despaired of their realisation;

he retained a traditional respect for the idea of Duty, as the rule of habitual conduct, and so escaped the difficulties which his rather vague negative philosophy left unanswered, by the practical expedient of living in a way in which it would be clearly innocent for other fathers of families and foresters to live likewise. The son had lost faith in revolutions from having seen one strangled when he was in the nursery; he had not been brought up to believe in the Divine right of the power which strangled it (or, indeed, of anything else, for the Waldfrieds are secularists); and he did not at twenty-three believe in the natural perfection or obligatoriness of the professional and domestic routine upon which he was expected to enter. Ernst is the black sheep of the story, and since the real and the ostensible author seem equally unable to see how damaging his criticisms are to the intellectual pretensions of the system of moral and political expedients which he repudiates, we may infer with more confidence than if it were what the writer had meant to prove, that with the elder generation of German politicians the instinct of loyalty, the habit of obedience, and the desire for a rule of some kind, are much more strongly developed than the idea of any special qualities as admirable or indispensable in a leader, or of any definite course of conduct as in itself right and bindingly desirable.

Ernst becomes more tractable after having been allowed to engage himself to the enigmatical maiden who is such a frequent appearance in German romance: this time she is a wood-nymph, Martella by name, and comes to learn housekeeping and *Bildung* from Ernst's mother. He is still discontented with his prospects at home, and applies for a government licence to emigrate. Before it is made out, the war between Austria and Prussia is declared. The sympathies of the elder Waldfried are with Prussia; public opinion in the little state, so far as it existed, was in favour of peace; but the representative assembly (of which Waldfried is a respected member) votes a war credit, without remonstrance, in the pious hope that it may not be used. Ernst was still liable for military service, and is summoned to his regiment; he curses the war as fratricidal; his father agrees with him, and indeed goes the further length of believing that the defeat of Prussia will be the ruin of Germany; and yet—this is the most extraordinary instance of the moral obliquity of vision from which poor Ernst's irreverence is a bequest—he does not appear to have any qualms of conscience about his own and his son's complicity in the public crime, and he parts from the latter with an expression of trust that he will "do his duty"—in the military, since it can scarcely be in the moral, sense of the word. Ernst, however, does not acknowledge the duty of fighting in a civil war without, much less against, conviction, and takes the first opportunity of deserting. The paternal pen hesitates to write it: he is *fahnenflüchtig*. There is but one sentiment, of shame and horror, for the deed in every well-disposed breast, too profound to be shaken by the often-expressed belief that the Prince himself and three-quarters of the army would have followed the example—had

they dared. The writer does not seem to see that he is accusing his fellow-countrymen of a political immorality compared with which the levity of the French populace voting by mistake for a *promenade* to Berlin is a venial indiscretion. But it is probable that later events have somewhat coloured the recollections of that time, and that the war of Sadowa was not so uniformly unpopular with the defeated as the reconciled amongst them, and the conciliatory amongst the victors, would now be glad to believe. Ernst being cut off from family and Vaterland, goes to Algiers and enlists among the Turcos.

The moral atmosphere having reached its darkest pitch, begins from this point to clear. "Our superiors (*die Obrigkeit*) right or wrong!" is a moral sentiment only so long as it expresses a sincere personal devotion to the personal representative of revered principles, and because this had long ceased to be the case in the anonymous little principality in question, Waldfried's sense of duty and public virtue produce the painful impression of standing upon nothing and exercising themselves in vain. "Our country, right or wrong!" is not in itself a more rational cry, but it has the merit of bringing all who utter it spontaneously, on the same occasion, into the moral relation of sympathy and co-operation. A foreign war, whether in itself just or unjust, if it is popular with the whole nation, inevitably strengthens some of the feelings which develop into national virtue; and when the successful conduct of the war becomes associated with the attainment of an end in domestic policy which is itself also popular, the enthusiasm may easily outgrow its rational base and its maintenance as an end in itself serve for a time as a moralising force with all who share it. All purely political ideals being alike empty of moral significance, the historical importance of any one depends upon the enthusiasm with which it is pursued and established. There is no mystical sanctity about the conception of a united Germany; but when, as a historical fact, that conception comes to be adopted as the symbol of free thought, social decorum, and free government, by many millions of Waldfrieds, when their loyal and law-abiding impulses accept it as heartily as their indolence and slowness for practical initiative, then, and not before, not by its intrinsic reasonableness, but by the earnestness of the feelings which agree in placing their satisfaction in its attainment, German unity becomes almost as influential in the history of Europe as the field preachers and professors used to proclaim. The nearest approach to a critical estimate of the crisis in the book is put in the mouth of Ludwig, the naturalised American, who admits that German patriots had been a little too much disposed to expect the rest of the world to take their political virtues on the faith of an *a priori* demonstration. The work shows abundantly how the establishment of the German Empire was hailed as a relief by the moderate Liberals, who disliked having to be always in the opposition, and by all the docile constructive aspirations for which it furnished employment, as well as by all the latent Chauvinism in the country, which

was at last supplied with matter for self-glorification. What we do not gather at all is any clue to the autobiographer's hopes or wishes concerning the future policy of the united fatherland. It is to exist; its sons are to be *pflchtgetreu, gediegen, genußvoll*; but it is impossible to resist the impression that as yet the ideal of German character is colourless, the immediate programme empty. Ludwig is to inherit his father's industry and plantations of forest trees, and he sets up a *Fabrik* of upholstery and cabinet-work in the village; but Waldfried himself does not mean to seek re-election in the central legislature, and will be content to leave the direction of the state, for a good many years to come, in the hands of men who take his own, slightly antiquated, view of ministerial responsibility; on the eve of the war he had been asked conditionally to take office in his own state, and congratulated himself that the pledge was not to be redeemed, because he preferred to keep his independence: an independent minister was a character that had not occurred to him as possible.

When war with France is declared, the whole family takes the field, in some capacity or other; Martella shows her still defective *Bildung* by trying to cross the lines in search of Ernst, whose military career is certainly unfortunate, for, finding himself opposed to his countrymen, he deserts a second time, and in this case his father's principles do not seem offended, though he immediately bears arms against his late comrades. He exposes himself daringly, and is killed; Martella dies with him; the other characters are wounded, or taken prisoners, or marry, as the case may be; a good many of the elders narrate their experiences and the military or domestic trials to which the establishment of German unity is somehow or other to put an end. As an instance of the slight inconsistencies into which the author's optimism betrays him, we may mention his complacent remarks on the good discipline of the invading army, and the impression made on the French by the sight of officers of high rank attending church with their men; whereas one of the officers who tells his story to Father Waldfried, enumerates as one of the demoralising incidents of military slavery that they used to take the Sacrament *aus Disciplin*. Besides the political incidents, there is a good deal of intermittent love-making between the Professor and a highly-educated Jewess, who acquires sobriety and considerateness from her contact with the ideal German household. The story of Martella's birth and eccentricities of character also occupies some space; but as a novel the work is inferior in interest to most of the author's former publications. The English translation, which has just been published by Messrs. Sampson Low & Co., preserves the rather stiff simplicity of style generally maintained by the original; though in a few cases, where the simplicity is idiomatic, a literal rendering makes the result unduly tame.

EDITH SIMCOX.

It is stated that M. John Lemoine is a candidate for the *fauteuil* in the French Academy vacated by the death of Jules Janin.

Toronto of Old: Collections and Recollections illustrative of the Early Settlement and Social Life of the Capital of Ontario.
By Henry Scadding. (Toronto: Adam, Stevenson & Co.)

An antiquarian work concerning a city not older than the days of our grandfathers is a curiosity. An archaeological treatise on the antiquities of Middlesborough, Birkenhead, or New Goole would seem a strange book to an Englishman, and yet there are far more details as to the remote past to be gathered regarding the newest of these English towns than any of which Toronto can boast. Yet, short as has been the life of this flourishing American city, it has afforded ample material for a very interesting book, by one who is evidently possessed in a high degree with the love of historical research. To the true student of history it makes little difference whether the events in which he is interested took place in far remote or in recent times. The methods by which truth is to be picked out from falsehood are the same whether he is dealing with Greek republics, mediæval countships, or the cities of the New World. The same plodding industry is required, the same temptations against rapid generalisation and sensation paragraph writing have to be overcome. Dr. Scadding has avoided both these pitfalls, and a most useful and amusing book has been the consequence. We have not, as is too common in transatlantic literature, weary discussions on insoluble questions of ethnology, but instead thereof a carefully compiled history of what we writing for Englishmen must call a very modern city.

The arrangement of the work is such as we are familiar with in the best class of guide-books. The author takes his readers from street to street and tells them as he goes along what he knows about the remarkable buildings of the present and the past, and of the noteworthy people who have been connected with them. Incidentally, he gives us information on matters beyond the range of his immediate subject, as when he tells us what in his opinion is the derivation of the word Canada.

"Kanata was a word continually heard on the lips of the red men in the Lower St. Lawrence, as they pointed to the shore; they simply meant to indicate 'Yonder are our wigwams;' but the French mariners and others took the expression to be a geographical name for the new region which they were penetrating, and such it has become."

But this is only by way of illustration. Gossip about men and things in general is as a rule carefully avoided, even when there were circumstances in the narrative which must have rendered such sensational digressions very tempting. The habits of all communities in a rude state are much the same, but it is still curious to be told that the Parliament of Upper Canada, which "assembled at Newark, just across the lake," and which introduced such reforms as trial by jury, and the prohibition of the spread of slavery, conducted the business of the province under a spreading tree, "while a boulder of drift lifting itself up through the natural turf" served as a desk for the clerk who recorded the proceedings. We hope this historic tree and stone are carefully

guarded, as mementoes of a past state of civilisation.

Another strange parallel between the Old and the New World forces itself upon our notice. In 1795 the attendance of members of Parliament on their duties was so small, that there was danger of the public business coming to a standstill. One main reason of this was that "the harvest had now begun, which in a higher degree than elsewhere engages in Canada the public attention." At the Parliament held at Scone in 1367, certain persons were elected by the estates *ad parlamentum tenendum*, and the rest were permitted to go home again to get in their harvest (Innes, *Scotch Legal Antiquities*, 119).

The writer has a warm affection for the old country and the old country's language, which we are glad to see. A pleasant-sounding Old-English word, such as *reeve*, *warder*, *provost*, or *recorder*, evidently cheers him, as the flowers we have loved in childhood cheer us when we meet them in old age far, far away from home. Strangely enough, however, among these old words he puts in *railway*—in America they always say "railroad." "Railway" is, however, the new name with us. In the early days of locomotive travelling they were always called "railroads." (See *Gentleman's Mag.*, 1824, ii. 512; 1825, i. 113.) If we are not much mistaken, the first newspaper devoted specially to the interests of railway shareholders was called the *Railroad Times*.

The Canadians, as a people, seem to share Dr. Scadding's conservative love for things English. The record of the grants of land from the beginning of the organisation of Upper Canada to the present time, is called *Domesday Book*.

The accuracy of the book, from first to last, as far as we have been able to test it, is in a high degree commendable. There is, however, a little slip at p. 127. We are told that when Sir John Colborne went to church at York (Toronto), he used to be accompanied by "a shy-mannered, black-eyed, Italian-featured Mr. Jeune, tutor to the governor's sons. This was afterwards the eminent Dr. Jeune, Master of Pembroke College at Oxford, a great promoter of reform in that University, and Bishop of *Lincoln*." This mistake is probably not a misprint, for it is repeated in the index.

EDWARD PEACOCK.

Campaigning on the Oxus, and the Fall of Khiva. By J. A. MacGahan, Correspondent of the *New York Herald*. With Maps and numerous Illustrations. (London: Sampson Low & Co., 1874.)

Long after all the Russian detachments had commenced their march to Khiva, in the spring of last year, the *New York Herald* correspondent started for the same point. He overtook the main body, under General Kaufmann, reaching the Oxus just in time to hear the booming of the first guns as they belched forth grape upon the Khivans on the opposite bank. Having cheerfully endured the greatest misery in the sandy deserts, witnessed and taken part in the campaign from beginning to end, Mr. MacGahan has now anticipated the Russians in a full and graphic description of the whole

affair. And long, perhaps, before the Russian official record of the military operations, which is in course of compilation, is made public, the book before us will have been read in the Russian language in all the capitals of the Empire, for, if we are not mistaken, a Russian translation was being made from the author's proof sheets. We will reserve all observation on the conduct of this brilliant Russian expedition until the appearance of the circumstantial official Russian narrative.

The feat performed by our author was unique of its kind. To say that nothing similar has been done even by a Russian is, perhaps, not stamping the adventure sufficiently either with a mark of all the sufferings and the no small danger which it involved, or with that degree of merit which attaches to its accomplishment. No single Russian has felt a call to go thus direct; there are easier, if more circuitous routes, and Russians generally form about as great an estimate of the value of time as the dignified Khivan ambassador referred to in the book, who was too late everywhere to save his country from invasion. Our author, in company with Mr. Schuyler, Secretary of the United States Legation at St. Petersburg, proceeded by Saratof and Uralsk to Orenburg. Here Mr. MacGahan secured the services of a Tartar servant, who was subsequently the plague of his life in the desert. The two American gentlemen then travelled on to Kazala, on the Jaxartes. Finding here that Colonel Golof's detachment had been gone some time to join the main column in the Bukan hills, and being refused permission by the commandant of the fort to start off in its pursuit, the correspondent and the secretary made as much haste in getting to Fort Perofski as camels, sands, and apathetic Kirghizes would allow.

The first difficulty to be overcome was the existing order by Kaufmann prohibiting the admission of Europeans into the province of Turkestan. This was, however, smoothed over by production of passports which showed our travellers to be Americans, a contingency which had not been provided against. Another traveller, and a would-be correspondent, assumed, we believe, the same nationality, and with equal success. The next difficulty in prospective was that, although provided with letters to General Kaufmann, Mr. MacGahan might find at Perofski a commandant equally obdurate with the one at Kazala, and be refused permission to strike into the steppe from that point, to take up the trail of the receding troops. This permission was not withheld by Colonel Rodionof, who exercised a wise discretion. We are glad to find that although that officer was "deprived of his situation" for it, he was subsequently promoted by General Kaufmann to a higher post in the province; and this, we take it, was in no small degree owing to the high favour in which Mr. MacGahan had been held in the Russian camp. On April 30 Mr. MacGahan waved a last adieu to his companion from across the Jaxartes, and dived into the desert. With his Tartar servant, a Karakalpak guide, and a young Kirghiz called *Tungerberkhen*, and with six

horses, this plucky American commenced a journey across a desert the like of which had never been performed, as he says, by a "white man." There are routes in every direction across this country, and caravans usually pass between Kazala and Bokhara; Meyendorff having traversed the Kyzil-Kum to Bokhara from the *embouchure* of the Jaxartes, in 1820; but, notwithstanding this, MacGahan's exploit, if we take into consideration the circumstances which in his time increased the risk of travelling across this desert, and the conditions under which he did traverse it, claims the distinction of novelty, to say the least.

There are, however, these points of similarity between the German and the Anglo-Saxon: they were both "men of peace," and both were amply provided with means of defence. Meyendorff had two field pieces and an escort of 200 Cossacks and 200 infantry soldiers; while the *New York Herald* correspondent's "light and unpretentious equipment" consisted of "a heavy double-barrelled English hunting rifle, a double-barrelled shot gun, an eighteen-shooter Winchester rifle, three heavy revolvers, and one ordinary muzzle-loading shot gun throwing slugs, besides a few knives and sabres." The observation made by our author to the effect that these "light" arms were calculated to enable him to "discuss with becoming dignity questions relating to the rights of way and property with inhabitants of the desert, whose opinions on these subjects are sometimes peculiar," applies to both cases, and closes the comparison.

The Kyzil-Kum desert in question reminds us of another traveller, viz., the late Mr. Fedchenko—so well known for his excursions in Kokand. Mr. Fedchenko traversed the eastern portion of the Kyzil-Kum, to which, however, that name is not strictly applicable, for it was found to be a meadow land stretching forty miles from the Jaxartes to the verge of the sands. Mr. Fedchenko claimed credit for the discovery of this hitherto unknown fact, through which Russia found herself possessed of more arable land in Asia than she knew the existence of. Strange to say, however, neither Fedchenko nor MacGahan has borne any testimony to the statement made by Baron Meyendorff to the effect that an ancient river channel intersects the Kyzil-Kum desert, as he in part shows on his map. Mr. Fedchenko also "found a direct route across the Kyzil-Kum to Khiva, called the Irmir route." MacGahan, aiming with an undaunted determination at his goal, found another which brought him to it.

Returning to the subject of the book before us, we find the author, after a long and weary journey, in the embraces of the officers of the rear-guard of Kaufmann's force. Noble fellows themselves, they fully appreciated the almost heroic feat of the ubiquitous correspondent. Being greeted with but a cool reception by the commanding officer, a German, and denied by the latter both provender for his horses and the barest necessities of life for himself, the Russian officers share and share alike with him, and he becomes from that moment a favourite with all. Weimarn, the colonel in command,

refuses to allow our author to proceed alone; but the latter showing, in another marked instance, the metal he is made of, eludes Weimarn's vigilance, and reaches the Oxus, where we found him at the opening of this notice. He was fortunate enough, after detaching himself at night from Weimarn's column, to reach the next well on the line of march, and to leave it again only a couple of hours before a party of Cossacks sent in pursuit of him arrived breathless to disarm and take him in disgrace to Tashkend. This chase after an American spread far and wide, and awakened in every one, from the soldier to the general in command, and the two brave young grand-dukes, an unbounded admiration of our plucky hero. We leave Mr. MacGahan to speak for himself on the vicissitudes he passed through, on the immense relief he experienced on reaching a well, and on the hearty and generous treatment he met with at the hands of the Russian officers. The great dexterity which he displayed throughout may be read only between his modest lines, but a more genial spirit and happy frame of mind never pervaded an account of travel.

Having passed twenty-nine days in the desert, and mixed with the nomad Kirghizes, Mr. MacGahan has thoroughly studied that people, and is the first to acquaint us in a popular manner with their character and mode of life. He gives us a very correct notion of their migrations and transmigrations, which are almost as regular as clock-work, showing that by a tacit understanding practice can be reduced even among a barbarous and wandering people, to as beautiful a system as any that is enforced by regulations.

Throughout the campaign there was no fighting—or very little that deserved the name of battle. There were two crises in which the success of the whole undertaking was placed in jeopardy: the first occurred in the steppe between Adam-Kurnlgan, "fatal to men," and Khala-ata, owing to absence of water, which was luckily found some miles off the road at Alty-Kuduk; the second crisis occurred in an action with the Turcomans, who took the Russians by surprise between two and three o'clock in the morning, when

"all at once a wild fierce yell, a horrid confused sound of frightened shouts, scattering shots, and a trampling rush of horses, breaks upon our startled ears. Everywhere—before, behind, around—the air is filled with the wild revengeful yell, the plain alive with the Turcomans."

We quote further to illustrate this scene:—

"For a moment we sit spell-bound in our saddles, too much amazed to do anything but gaze in dumb astonishment. . . .

"Now there is a confused rush of Cossacks backwards, that carries me along. It is, perhaps, not a flight, but something that very much resembles one, or the beginning of one; and besides there is something fearful in the air; something the like of which I have never experienced before or since, and which I can only compare to the ominous threatening atmosphere said to always precede an earthquake; above the uproar, the cries, and shouts, and confusion, a low, ominous, frightened murmur, like the commencement of a cry of despair. We are on the verge of a panic. The Cossacks have lost their colonel; and looking at them closely, I can see their scared, anxious faces, and know well what that means. A rout—a

massacre: not one of us will escape the Yomuds, with their fleet-footed horses."

They did, however, escape; the horses of the Yomuds were too fleet; the Turcomans came down upon the Russians like an avalanche, right upon the camp, scattering the entire staff, and fortunately they rushed through too rapidly, otherwise we might not so soon have had a narrative of the campaign.

General Golovachef was very hard, too hard, on the Turcomans, who were ready to come to terms and to pay the war contribution imposed upon them. They had no friend, not even in the Khan of Khiva, to save them; and so sensible were they of the harsh measure dealt out to them by General Golovachef, that they innocently appealed to the auxiliary column under Verofkin—with which they were on the most amicable terms—to aid them in combating Golovachef's troops, who were shelling and harassing the tribes.

The work is clever, well written, and full of quaint humour; but we have perhaps said enough to awaken a curiosity which will be fully gratified when the book is read. It is a book which will worthily meet the demand for information on the subject it treats of. Mr. MacGahan has earned a mark of the Emperor's appreciation of his indomitable energy and bravery, and a sobriquet *nobledetz*, for which we have not an equivalent in our language. He has earned every penny of his emolument as correspondent of the *New York Herald*—an emolument which made him regard the risks which he ran as nothing, since he had undertaken them as a duty; and from the British public he deserves the best thanks for a work of instruction and of pleasing entertainment.

ROBERT MICHELL.

Jean de Salisbury. Par l'Abbé M. Demimuid. (Paris: Thorin, 1873.)

It would seem to be the fate of the eminent Englishman of whom this is the latest biography to be more highly appreciated on the Continent than among his own countrymen. Before the publication of his complete works by Dr. Giles, in 1848, his *Life of St. Anselm*, inserted by Wharton in the *Anglia Sacra*, and *Life of St. Thomas*, edited by Giles, with other biographies of Becket, in 1845, had alone been printed in England; while abroad the *Polieraticus** appeared as early, it is said, as 1475, and foreign editions, both of that and his other works, as well as of his Letters, followed each other in quick succession down to our own times. Nor, again, if his works thus tardily found a native editor, has any Englishman yet given us his biography, at least at any length or in a separate work such as the present volume by M. Demimuid, or that by Schaarschmidt published some dozen years back. These two works differ in plan and character, but each has its peculiar

* Mezeray's French version of this work (Paris, 1640) is not so "introuvable" in England as M. Demimuid found it to be in France. A copy exists in the British Museum, which, we may observe, bears out M. Demimuid's supposition, that it was from the Life of the author prefixed to this translation, that Bayle derived some of his information concerning John of Salisbury.

merits. The German author devotes about one-fifth part only of his volume to what may be strictly termed John of Salisbury's life, the remainder being taken up with a critical account of his masters and studies, and an examination in detail of his several works. M. Demimuid on the other hand is less minute and searching in his criticism of the *Policraticus*, *Metalogicus*, and *Entheticus*; but he tells the story of the author's life more fully and correctly, and with greater clearness and vivacity, than his predecessor. John of Salisbury's own valuable letters, and the biographical details scattered among his other writings, are admirably worked into the narrative; and the references in the footnotes show the diligent use the author has made of all the authorities upon his subject. The result is a highly interesting and useful work, marked throughout by candour and moderation both in the estimate of the character of the hero and of the famous controversy in which he bore a conspicuous, if subordinate, part.

John of Salisbury is, we suspect, better remembered in modern times from his connexion with the future St. Thomas of Canterbury, than from his authorship of the *Policraticus*. This treatise, however, (the name of which, it appears, should be so written, as derived from *πόλις*, and not in the form *Polycraticus*, as if from *πολύ*) seldom as it is probably now read, was one of the most popular works of the Middle Ages, as it was one of the earliest books to be printed. Its purpose, as suggested by its more extended title, "*de nugis curialium et vestigiis philosophorum*," was to expose the vanities and trivialities of the court and the world, and to point out the path which true philosophy should teach men to follow. The author was in many respects peculiarly qualified for his task. The work appears to have been written between the years 1156 and 1159, when John of Salisbury had already, as confidential secretary to Theobald, Archbishop of Canterbury, as a resident at the Court of Henry the Second, and as a frequent ambassador to Rome, enjoyed every facility for observing the motives and passions that swayed the conduct of the churchman, the courtier, and the politician of his time. On the other hand, he had spent twelve years of his life, from 1136 onwards, in France, studying in every department of learning under the most famous masters of the age, beginning with Abelard himself, and including Robert de Melun, Guillaume de Conches, and Robert le Poule. As regards the last-named, we may observe in passing, that M. Demimuid follows Schaarschmidt in maintaining, in opposition to Petersen (*Entheticus*, p. 74) and others, that he must have heard him at Paris and not at Oxford, and that he did not return to England till his studies were finally completed. If not a philosopher himself (and M. Demimuid denies his claim to the title), John of Salisbury was versed in all the doctrines of the schools, and both in character and attainments was eminently fitted to be their critic. Few of his contemporaries, again, could boast such an extensive acquaintance with classical literature. Of all the subjects included in the "trivium" and "quadrivium," grammar, it is plain, was his

favourite study, the term as then used being synonymous, as M. Demimuid remarks, with "belles lettres," embracing, as it did, "avec les éléments du langage, la lecture des poètes et des historiens, celle de Virgile et d'Horace, de Tite-Live et de Tacite, aussi bien que de Donat, de Servius et de Priscien." The familiarity with Greek, however, with which he is credited by Leland, Fabricius, and others, is doubted on good grounds by M. Demimuid, who shows that his knowledge of authors in that language was most probably derived from Latin translations alone. Notwithstanding all these advantages, and the undoubted ability, learning, and power of observation it displays, the *Policraticus* has faults which are fatal to its popularity with modern readers. Its want of arrangement, its irrelevant and interminable digressions, above all its pedantry, make it appear dull and heavy, compared, for example (as the similarity of title naturally suggests), with the lighter and more graphic *De nugis curialium* of the author's younger contemporary, Walter Map. John of Salisbury is seldom able to resist the temptation to display his erudition. He cannot, for instance, describe the evil results of the prevailing fondness for the chase, or recent innovations in church-singing, without going back to the very origin of hunting and music in sacred and profane history, and obscuring his immediate subject, on which he has really valuable remarks to offer, with a cloud of learned reminiscences. Again, when treating of omens and presages, he is led to mention those which preceded the fall of Jerusalem; and he at once digresses to give, in its minutest details, an account, drawn from Josephus, of the siege of that city, not omitting the story of the mother who ate her child, or the number of the killed, the wounded, and the captives. Nor is he even content with this; for "à peine l'historien a-t-il épuisé ses souvenirs, le philosophe paraît qui veut avoir son tour," and we are accordingly treated to a tedious discussion on Providence and freewill. Despite its defects, however, the work contains abundance of valuable matter which goes far to justify its former reputation. The author is not always a pedant. Often we can say with his biographer, "Ce n'est plus l'érudit, c'est l'observateur qui nous parle." Much curious information and keen criticism on contemporary manners and morals are to be found in his pages; and his boldly-expressed opinions on tyrannicide, on the relation between Church and State, on the duties of a king, and on the mutual dependence of class upon class, are especially valuable, as are also his remarks upon the philosophical sects of his day. Into this latter subject he enters more fully in the *Metalogicus* and *Entheticus de dogmate Philosophorum*, of which the first, especially, contains many interesting particulars, drawn from the author's own experience, of the schools of the Continent. The *Entheticus*, like the preface to the *Policraticus*, sometimes called by the same name, but also distinguished as the *Entheticus*,* is written in elegiac metre, and gives

a favourable idea of the author's skill in Latin versification. Indeed, John of Salisbury's Latin in general excels in purity and taste that of most writers of his time; but in neither respect can it be said to deserve the immoderate praise which some modern authors have lavished upon it. It appears to the best advantage, we think, in his letters, and the same may be said of John of Salisbury himself; for the style of these, good as it generally is, forms their least claim to notice. Apart from their general interest they supply the most trustworthy and valuable materials we possess for the history of the protracted struggle between Henry II. and Archbishop Becket. When, in 1162, the latter succeeded Theobald in the primacy, he retained John of Salisbury, whose patron he had long been, in the same office which he had held under his predecessor, and honoured him with equal friendship and confidence. Is the wonderful change which speedily showed itself in the character of the new Archbishop in any way to be attributed to the influence of his secretary? M. Demimuid holds that it is, and that the effect of this influence has been underrated by those who have sought to determine the causes of the transformation. John of Salisbury's zeal for the interests of the Church was certainly of older date than that of his patron. It had found emphatic expression in his writings, and seems already in the lifetime of Theobald to have brought him into trouble with the King. Whatever share he had, however, in forming the opinions of Becket, he supported them with equal firmness and ability. But though a strong partisan, and as staunch to his principles as Becket himself, he shows in his whole conduct a manly independence that does him honour. When Becket is wrong, he advises and rebukes him with the utmost candour and boldness; and in wisdom, moderation, and perhaps too, in sincerity, he contrasts favourably with his leader. Pierre de Blois styles him "*manus Archiepiscopi et oculus ejus*;" and his claim to what M. Demimuid calls "*la glorieuse responsabilité de la résistance de son maître*," is in some degree supported by the fact that a year before the banishment of the Archbishop himself it was thought necessary by the Court to drive him into exile. John of Salisbury's conduct at the closing tragedy of Becket's murder is somewhat severely judged by the Abbé, who, it is plain, can ill forgive him his attempt to deprive the Church of a saint and martyr. That it was Becket's duty to court death in the way he did, and that John of Salisbury acted unwisely and culpably in advising him, after the first stormy interview with FitzUrse and his fellow-ruffians, not to fly or to yield, but merely to take measures to nullify their threats, we are unable to see. His desertion of his master when the assassins entered the church is less defensible; but his flight, like that of others, was doubtless due more to momentary panic than to a deliberate intention to leave

ful a writer as Sir T. D. Hardy into denying (*Catalogue of Materials for Brit. Hist.*, vol. ii., p. 422) the existence of a separate *Entheticus* altogether. Fabricius, whom he follows, wrote before the work was printed; but after the appearance of Petersen's edition (Hamb. 1813) the error is less excusable.

* This confusion of names has misled even so care-

the Archbishop to his fate. His contemporaries at all events do not seem to have thought any the worse of him for his pusillanimity; and he continued after Becket's death to maintain his importance in church affairs. He remained indeed in something like retirement during the vacancy of the see, but exerted his influence to secure the election of Richard, and, on his consecration in 1174, he resumed his old post of archiepiscopal secretary. In 1176 he became Bishop of Chartres ("divina dignatione et meritis Sancti Thomæ," as in his formal title he styles himself), in a way that did equal honour to the cathedral chapter, the King of France, and himself; and thus the last four years of his life (he died Oct. 25, 1180) were spent in the land which had given him his education in his youth, and in later life had hospitably received him as an exile.

John of Salisbury can hardly be called either a great writer or a great politician, but he was certainly one of the most learned and sagacious, and, we may add, one of the best and most honest, men of his time. What, asks M. Demimuid, in the history of the twelfth century chiefly claims the attention of the student? "C'est la querelle des deux pouvoirs, un moment circonscrite entre deux champions fameux, Henri II. et Thomas Becket; c'est d'autre part le mouvement des études et des esprits, qui a son centre dans les écoles de Paris." It was the fortune of John of Salisbury to be a participant both in the intellectual movement and in the political controversy; and we are as much indebted to his letters for what we know of the one, as we are to his philosophical treatises for what we know of the other.

"Veut-on s'asseoir," continues M. Demimuid, "un instant au pied de la chaire de ces professeurs célèbres, dans la foule si animée de ces étudiants de toutes langues et de tous pays: on ne peut choisir de meilleur introducteur, de meilleur guide que Jean de Salisbury. . . . Veut-on suivre le dé mêlé du primat et du roi d'Angleterre depuis son origine jusqu'à son sanglant dénouement: un des meilleurs historiens à interroger, c'est encore Jean de Salisbury."

It is for these reasons that John of Salisbury's *Life* has a special interest and value; and it may be added that in neither respect has it lost by the treatment it has received at the hands of his present biographer.

GEO. F. WARNER.

NEW NOVELS.

Reginald Hetherage. By Henry Kingsley. (London: R. Bentley & Son, 1874.)

Mistress Judith. By C. C. Fraser-Tytler. Second Edition. (London: Sampson Low & Co., 1874.)

William Mellish. By Frank Trollope. (London: Morgan & Hebron, 1874.)

Under Seal of Confession. By Averil Beaumont. (London: Sampson Low & Co., 1874.)

John Markenfield. By Edward Peacock. (London: Chapman & Hall, 1874.)

The Honey-moon. By the Count de Medina Pomar. (London: Trübner & Co., 1874.)

George Goring. By Cecil Rushton. (London: Morgan & Hebron, 1874.)

My Mother and I. By the Author of "John

Halifax Gentleman." (London: Isbister & Co., 1874.)

Clytie. By Joseph Hatton. (London: Chapman & Hall, 1874.)

If nicknames were not rash as well as rude, we should be tempted to try our skill at one, and to call Mr. Henry Kingsley one of Heaven's Undergraduates. Almost all his characteristics as a novelist are those of the typical undergraduate, intensified and sublimated of course. His ideals of male and female character—particularly his usual hero, who is a tremendous fellow at everything, but gets into awful scrapes, and is invariably forgiven by an angelic father—are intensely undergraduate, and so is his style with its perpetual flow of rather forced humor, partaking freely of exaggeration and burlesque. Now, although an undergraduate is a noble and interesting product, he is or ought to be essentially transitional, and Mr. Henry Kingsley shows no signs of transition, except occasional retrogressions into the schoolboy stage. The man who could write *Geoffrey Hamlyn*, and *Ravenshoe*, we hardly remember how many years ago, ought by this time to have turned out something of really permanent value, and we fear that *Reginald Hetherage* can hardly be said to possess much value of any kind, except such as most of the better class of ordinary novels may claim. The first volume is reasonably interesting, (probably on account of its natural allowance of expectation) the second less so, and the third drags terribly. The plot turns on a will supposed to have been made, in the Thellusson style, about a hundred years ago by a rich and diabolical merchant to spite his relations. According to this will, no one can inherit till the death of every male descendant of one of the heirs expectant who may be alive at the time of the testator's death. Reginald Hetherage, the hero, further complicates matters by coming prematurely into the world just two days before the said death, and so postponing indefinitely the chance of a settlement. His various trials and woes form the subject of the book. He has a son (who is the ideal hero before-mentioned, spiced with a dash of something very like blackguardism), besides two murderous, and many more simply unpleasant cousins, but is none the less angelic, all-accomplished, and finally triumphant. In addition to the will, there is a mystery which is at last cleared up in a lame and rather unintelligible manner. The book is pleasantly written, and is, we think, rather an improvement on Mr. Henry Kingsley's late productions; perhaps in process of time he will get back to something nearly as good as his earlier efforts.

Mistress Judith, though we do not greatly wonder at its having obtained the honours of reimpression, is scarcely a successful book, and is most certainly disappointing. No doubt it is a praiseworthy thing to confine oneself, as the writer has done, to a simple subject, and to trust for effect to careful and elaborate treatment. But there is often a tendency among critics in the present day to take the will for the deed. *Mistress Judith* has just come short of its author's intentions. To begin with, it is too long by at least half its length, and

again, the writer is not uncompromising enough in her treatment of her Cambridge-shire Arcadias. There are only two ways of treating Arcadias—the one utterly realist, the other emulous of the Dresden variety; and it does not do to mix the two. It strikes us also that Jesse Bullen's conduct is not only improbable, which does not much matter, but also unintelligible, which does. As a really praiseworthy effort, showing here and there a bit of really good work, the book may be recommended; but it cannot be praised as a whole.

But if there ever was a book which would justify a critic in leniency to all other books, and in giving all possible credit to their authors, that book is *William Mellish*. It is historical—that is to say, the names of Cromwell, Charles II., Rochester, and other unhappy persons, serve as pegs whereon to hang much improbable and ill-connected incident, much weary dialogue, and many wearier jokes—and it is on the whole the toughest and most terrible reading we ever encountered. It has not even the meagre consolation which many bad novels supply—it is too dull even to laugh at. There is a story somewhere in Mr. Forster's *Life of Dickens*, of a nurse or charwoman, or some other of Balzac's *bimanes femelles*, who refused to believe in an individual author of *Dombey*, declaring that "she thought it must have taken half a dozen men to put *Dombey* together." If this argument be good, Mr. Frank Trollope's individuality is in danger, for it must surely have taken the aggregate stupidity of half a dozen stupid men in their stupidest moments to put together *William Mellish*.

On the other hand, *Under Seal of Confession* is decidedly the sort of book which, as De Quincey's *Toad-in-the-Hole* remarks, "you can recommend to a friend." In the first place the characters are all articulate human beings, expressing and conducting themselves after the manner of their kind, and not doleful creatures with labels pasted on them and strings tied to their tails. There is a very decently constructed plot, moreover, and the book is written in good current English, not without intimations of the author's having been properly educated in respectable and not too foolish society. Miss Beaumont has also taken the trouble to prefix various well-selected mottoes to her chapters, a proceeding for which we must plead guilty to a doubtless weak-minded partiality. They may, of course, be derived from *Elegant Extracts*, but, on the other hand, they may be (and in this case we think are) evidence of some acquaintance with literature, a thing which may possibly be of use to a novelist. Stella Vane, the heroine, is a very natural and pleasant young lady, and Miss Beaumont has roughened her course of true love in a sufficiently ingenious and probable manner. The second heroine, Alice Etheredge, is not quite so good, for she is intended to be French-English (always a troublesome compound), and the author is not quite at home in the French part of the delineation. But all the other feminine characters are capital, and the masculine persons are not bad, for a lady. There is good landscape painting, too, not obtrusively inserted, and there is a murder of a certain

kind, for those who are that way inclined. But we are not going to describe the plot fully, because everybody who reads novels regularly (and not such persons only) should read *Under Seal of Confession*. It is a very good book indeed, and the best thing about it is that there is no circumstance or person in it not duly connected with the general action. This can be said of but very few novels; but it is quite certain that no one of whose books it cannot be said, has the slightest business to be a novelist.

John Markenfield would be a very much better book than it actually is, if Mr. Peacock could have kept his numerous Charles the Firsts out of the memorial. We doubt the justice of using a novel as a stalking-horse whence to shoot at one's various dislikes. Mr. Peacock's likes and dislikes, moreover, are very many in number, and divided *exiguo fine*. It is almost impossible to know when one is likely to incur his displeasure. Positivists and High Churchmen, advocates of slavery and deciders of the southern planters, people who deny the supereminent excellence of "blood," and people who condemn the capacity of those who do not live in drawing rooms, all fall under the lash, besides many other classes equally harmless and equally "impossible," as Sir William Hamilton would have said. Above all, it is dangerous and damnable, according to Mr. Peacock, to write poetry "in the tone of poets like Baudelaire." If you do this, not only must you necessarily be weak and foolish, but you will also inevitably indulge in all sorts of moral obliquity, until you perjure yourself in order to send to prison a girl who has refused to be your mistress, and fire pistols at people you dislike as a mild token of disapproval. All this is a pity, because Mr. Peacock writes like a scholar and a gentleman, and has contrived a plot of fair interest, with some good situations well contrasted. The scenery of the flats about the Humber, and the struggle for Kansas, are two subjects sufficiently different in kind; and they are both handled well. Mr. Peacock is not quite so strong in his characters; but even on this point he is rather above than below the average, and he has in fact produced an excellent novel, marred somewhat by his unfortunate propensity for airing crotchets. One of his warnings has every chance of being successful. We do not think many persons will write "like Baudelaire," for the reason given in the words of an unprincipled compatriot of that poet: "Il ne fait pas ce tour qui vult."

We gather from Count de Medina Pomar's dedication that *The Honeymoon* was written in his nineteenth year. This is a conclusion at which we should have arrived independently after reading these volumes. It is, of course, possible that some worse mischief might have been found for the Count's idle hands to do, and the sides of the book are adorned with a very pretty coronet and monogram. It is not in any sense a novel, being merely an account of a bridal tour, which introduces some not very brilliant descriptions of Scotch scenery, and a great deal of theological discussion, chiefly tending to prove the great inferiority of the Bible to M. Allan Kardec and the *Périsprit*. The latter point is particularly insisted upon in about 200 pages of letters, said to be by the

Count's mother, Lady Caithness. The book only deserves notice as suggesting an awful thought: will the many thousands of dull and illogical pious books which have deluged us in past years be followed by equally dull and illogical impious books in thousands equally many? Let us devoutly hope that what Mr. Carlyle calls "the kirk of the other complexion" will be at any rate less vociferous than its predecessor.

George Goring is an unpretentious, but by no means unsuccessful book. It is perhaps somewhat suggestive of, not to say suggested by, the authors of *Guy Livingstone* and *Kate Coventry*, but not at all to an unpleasant extent. Mr. or Miss Rushton (for Cecil, we think, admits of either sex, and there is a feminine flavour in the book) has wisely preferred one good volume to three possibly bad ones. There is just story enough to keep the book alive to its modest length. It is simply the history of the loves of two girls, perhaps a little too sharply typical in their styles. One is a worldly and slangy damsel, who remarks, in a fit of deep emotion respecting a former lover, that "the little beggar always said his prayers," expresses her intention to "marry an old fuddlediloo," a word new to us, by the way, and of doubtful signification, and is, of course, finally rewarded with the man she loves, and, as she would herself put it, a "pot of money." The other is a maiden so conscientious that she will not marry a man who has been divorced by reason of his wife's adultery, wherefore they both end their lives miserably—a Fakirism which, though rare, is at least as true to nature as the other's frivolity. The minor characters are natural and not unpleasant, and the dialogue, despite some slips, is lively and good.

My Mother and I has at any rate the courage of its title. I was very fond of my mother, and my mother was very fond of me. I was very beautiful and rather stupid. I had the usual grandfather, who neglected me till I was seventeen, and then adored me. I had a consumptive cousin, whom I wanted to marry, and who for inscrutable reasons would not marry me. To be near him I rather neglected my mother, who fell ill of small-pox and disturbed my mind. Everybody died, and I became a very rich old maid. If this account seems flippant, be it remembered that, *à femme avare, galant escroc*—flimsy work deserves flippant notice. There is stuff enough in this book for a magazine story of fifty pages, but certainly not for a volume of three hundred.

We should not be the least surprised if *Clytie* were to be a very popular novel. If anyone makes the Phocionic enquiry, "What is the matter with it?" we can answer that nearly everything is the matter. Mr. Hatton has taken up one whole volume with an account of a trial for libel; he has uttered an immense amount of claptrap; he has so managed his heroine's early conduct as to make us feel that if she did not behave as her enemy suggests, it was more a matter of chance than of character; and he has produced in one personage, Tom Mayfield *alias* Hugh Kalmat, undergraduate of Durham University and American new-light poet,

perhaps the most consummate literary bore that we have met for many a long year. This gentleman's peculiar weakness is soliloquizing before the bust of Clytie, from her likeness to which the heroine derives her name, and his soliloquies are bosh of the most unmitigated kind. Mr. Hatton's attempt to give an air of realism to the book by drawing largely on actual events and personages, is a trick as old as it is clumsy. In short, it would be very difficult to find a single redeeming feature in any part of these three volumes. GEORGE SAINTSBURY.

NEW FACTS ABOUT EDMUND SPENSER.

A NEW and most important fact in the life of Spenser is made known to us by the Fourth Report of the Royal Commission on Historical Manuscripts, which we proceed at once to lay before our readers. Among the manuscripts examined and reported upon by Mr. R. B. Knowles, belonging to Colonel Towneley, of Towneley, in Lancashire, is a folio volume in which are set down the disbursements for various purposes of the executors of Robert Nowell, of Gray's Inn, who died in 1569. This volume contains an entry of

"Gownes geven to certeyn poor scholler[s] of the scholls aboute London, in number 32, viz.: St. Paul's, Merchant Taylors, St. Anthony's Schole, St. Saviour's grammar Schole, and Westminster School. Cost of cloth with making, xix*li*. xs. viij*d*."

First on the list of scholars of Merchant Taylors who received these gifts stands "Edmunde Spenser." Spenser's designation as a "poor scholar" accords with what has been presumed of the circumstances of his parents from his entering Pembroke Hall as a sizar. But, presumptive as this evidence is, the same manuscript fortunately contains proof which places it beyond the possibility of doubt that the "Edmunde Spenser" of Merchant Taylors was the Edmund Spenser who entered Pembroke Hall on May 20, 1569. At a later folio in the volume, under the heading, "Geven to poor schollers of dyvers gramare scholles" there is this entry:—

"To Edmond Spensere, scholler of the Merchante Tayler schollers at his gowinge to Penbrocke Hall, in Chambridge, x."

This entry is dated April 28, 1569, three weeks before Spenser entered Pembroke Hall, and it is followed by two others which show the poet still in the position of a "poor scholar, —":—

1. "7 Novembris 1570.—To Richard Langher and Edmond Spenser, towne poore scholars of Pembrock halle, v*j* s. a peace, in the whole x*j* s. by the hands of Mr. Thom's New, fellow of the same howse."

2. "To Edmonde Spensere the xxiiijth of Aprill, A^o 1571, i*j* s. v*j* d."

It is a singular fact that the honour of having educated a poet, the beauty of whose writings was at once recognised by his contemporaries, should not have been claimed by this school during his lifetime. Not one of Spenser's biographers appears to have had the least suspicion of the fact. Mr. Payne Collier ventures a suggestion that he was possibly educated at Kingsbury, "in the county in which Shakespeare was born," but he has no better authority for this conjecture than the circumstance that an "Edmund Spenser" is mentioned in the Muster Book of the Hundred of Kingsbury as one of its inhabitants in 1569, who "may have been the poet's father;" while Chalmers dismisses the matter as of no great consequence, because "at that time much knowledge was not to be obtained in any lesser seminaries previous to academical studies."

The records of Merchant Taylors were searched by Mr. Knowles, in the hope of finding some additional evidence of Spenser's connexion with the school, but they proved to be very imperfect for this period, so that but small additional information could be gathered. A slight clue, how-

ever, to the question as to how the connexion came about, is to be found in them.

A few entries were found relating to one Robert Spenser, gentleman, of Lincoln's Inn, who was not, however, a member of the company. Putting him aside, there appear to have been two adult Spensers connected with Merchant Taylors while Edmund was in its school—Nicholas, a "wealthy and able" brother; and John, a "free journeyman," in the employment of Nicholas Pele, shereman, of Bow Lane.

"Was Edmund a poor relation of Nicholas Spenser, and was it Nicholas who for that reason, or for his name's sake, procured his free admission into the school? This is a mere conjecture, not improbable. But was John Spenser the father of the poet? This, again, is a conjecture. But Edmund's position as a poor scholar is in striking harmony with the supposition that his father was a journeyman clothworker—a 'free journeyman' of the company in whose school his son was receiving gratuitous education. The supposition acquires weight from the inference that the Masters and Wardens of Merchant Taylors, in their selection of free scholars, would give a preference to the poor members of their own mystery, and by the fact that they did."

In a supplementary note, however, made by Mr. Knowles after having gone through the whole of the Towneley Manuscripts, he states that he has found reason to doubt the conviction that John Spenser was the father of Edmund. Another theory is substituted for this which "has the double advantage of making an approach to certainty, and of adding, if it is sound, a fact to Spenser's life only less interesting than the discovery of his Grammar School." In a list of gifts made, July 1569, to the poor of several Lancashire parishes, the name of "Spenser" occurs frequently. Under the heading "Burnley" (Burnley) there are three entries, two of which are very remarkable:—

"Edmunde Spenser	-	iiij yards wollen.
Isabell Spenser	-	iiij yards wollen.
Agnes Spensore	-	iiij yards wollen."

The date of these entries is "the vijth of Julij A^o 1569," shortly after the poet went to Cambridge.

"Spenser himself" (writes Mr. Knowles) "has told us that his mother's name was Elizabeth. 'Isabel' (*Eliza-bell*) is Elizabeth and something more, but the identity is complete enough to justify the poet in linking his mother's name with those of his wife and the queen in the sonnet in which he praises the 'most happy letters' that compose that 'happy name.'"

"Were the Edmund and Isabel Spenser of Burnley the poet's father and mother? Apart from the coincidence of their Christian names, the supposition that they were derives an air of probability from the fact that, after leaving Cambridge, he is believed to have gone to reside with his relations in the north of England, when he met Rosalind, and acquired his knowledge of the dialect he has used in the 'Shepherd's Calendar.' If his parents, for one of whom at least he cherished a tender affection, were alive, they were most likely the relatives with whom he took up his abode on quitting the University.

"Spenser would therefore have passed some portion of the interval between his leaving Cambridge and his coming to London at Burnley, and it is a happy circumstance that from the venerable Hall, at whose gates Burnley lies, a manuscript should come into the hands of the Commission to reveal, after the lapse of three centuries, facts so interesting in his life as the later residence of his parents, his father's name, and the Grammar School in which he was taught the elements of learning."

The writer, however, omits to mention that this is by no means the first time that Spenser has been claimed by a Lancashire family.

In a communication to the *Gentleman's Magazine*, which appeared in the issue of that periodical for August, 1842, Mr. F. C. Spenser, of Halifax, produced a variety of evidence tending to show that the poet was descended from a branch of the Spensers, of Hurstwood, near Burnley; and that the family to which he immediately belonged

was probably seated on a little property, still called "Spensers," at Filley Close, at the foot of Pendle Hill, about three miles north of Hurstwood. Mr. G. L. Craik, in his preface to *Spenser and his Poetry*, published in 1845, gives a very full account of the result of Mr. F. C. Spenser's researches. From a pedigree of the poet's descendants, compiled by Sir William Betham from the public records of Ireland, it appears that Spenser, whose own Christian name of Edmund was perpetuated in his posterity of the elder branch, had another son to whom he gave the name of Laurence. Granting then that these somewhat uncommon names of Edmund and Laurence were family ones, it is a remarkable circumstance that they are the prevalent names of the Spensers of Hurstwood and that neighbourhood from the middle of the sixteenth down to the eighteenth century, as recorded in the various parochial registers. Without going further into particulars, it may be mentioned that in the register of baptisms of Burnley, from 1564 to 1703, there are twenty-nine entries in which occur the names of either Edmund or Laurence Spenser; besides that an Edmund Spenser signs the register as churchwarden in 1617, and again in 1649. In the register at Colne there are the baptisms of four Edmunds and three Laurences between 1622 and 1723.

"Notwithstanding," observes Mr. F. C. Spenser, "the great prevalence, well-known to genealogists, of certain favourite baptismal appellations in particular families, in the sixteenth and seventeenth centuries, perhaps few families ever exhibited such a formidable recurrence of names as we have here of Edmund and Laurence."

But if the chief argument in favour of Edmund Spenser having sprung from the Hurstwood family is the occurrence of the Christian name Edmund in the pedigree, we venture to bring forward another claimant for parental honours, who has an equal, if not a greater, chance of success. There was an Edmund Spenser living in London at the time when the poet's father most probably lived there; he is to be found in the account of the assessment on the City of London, made October 24, 33 Hen. VIII. (1541). He lived in the parish of St. Sepulchre, and was rated at 20*l*. Now if, in Oldys' tradition, we read West Smithfield instead of East Smithfield as the poet's birth-place, another point is gained in favour of the last-named Edmund. It may be further said that East Smithfield is not in any Ward of the City of London, but is a part of the hundred of Ossulston, in the county of Middlesex, and some years ago the late Mr. Joseph Hunter, the well-known antiquary and genealogist, searched through all the subsidiary rolls for that hundred from 32 Hen. VIII. to 5 Eliz., but was unable to find any person of the name of Spenser set down in them.

The name of Spenser, we should add, was by no means uncommon in London at this time. Besides Edmund there are nine others mentioned in the assessment roll of 1541. It will be worth while to give them here, with their ratings: Nicholas Spenser, in Trinity and St. Thomas the Apostle, 20*l*; Thomas, in St. Margaret's, Lothbury, 20*l*; George, in St. Martin's in the West, 40 marks; Thomas, in Cornhill Ward, 100*l*; William, in Wolchurch parish, 20*l*; Thomas, in St. Mary Botulf, 20*l*; Sir James, in St. James's parish, Vintry Ward, 2,000*l*; Thomas, in All Hallows the Greater, 80*l*; Thomas, in St. Clements, Candlewick St. 30*l*.

Sir James Spenser had a brother Robert, of Congleton, Cheshire, whose grandson Roger, also of Congleton, christened a son, born in 1600, Edmund. This is shown by the Heralds' Visitations of Cheshire.

That Spenser claimed to belong to the great Spenser family, and that his claim was admitted, is to be proved from many passages in his writings. Thus, in dedicating his "Tears of the Muses" to Lady Strange, he speaks of "some private bands of affinity which it hath pleased your ladyship to

acknowledge." This lady was Alice, daughter of Sir John Spenser, wife of Ferdinando, Lord Strange, who was son and heir of Henry, fourth Earl of Derby. The "Muiopotmos" is dedicated to Lady Carey, also a daughter of Sir John Spenser, with a hope that what he offers may be deemed to derive something of greater worth than it would otherwise have, "for name or kindred's sake by you vouchsafed." Lady Compton and Mountague was Anne Spenser, another daughter; to her the "Prosopopoeia, or Mother Hubbard's Tale," is dedicated, but without any allusion to a relationship between them. These same three ladies are commemorated, and the poet's connexion with them distinctly asserted, in his "Colin Clout's Come Home Again":—

"No less praiseworthy are the sisters three,
The honour of the noble family
Of which I meanest boast myself to be,
And more that unto them I am so nigh," &c.

"The nobility of the Spensers," says Gibbon, in his *Memoirs of his own Life*, "has been illustrated and enriched by the trophies of Marlborough; but I exhort them to consider the *Fairy Queen* as the most precious jewel of their coronet." Gibbon was, however, no genealogist, and the only further comment necessary on the above is that there is a very careful analysis of the Spenser pedigree through many generations to be found buried amongst the voluminous unpublished collections of the late Mr. Hunter in the British Museum, which warrants us in saying that there was no common ancestor (if one at all) nearer than the great-great-grandfather of the three ladies upon whose admission or testimony it may be said the whole rests. The birth of that ancestor cannot be referred to a year later than 1420.

J. J. CARTWRIGHT.

NOTES AND NEWS.

MR. FROUDE is about to leave England for a year or two. He starts in August on a tour of inspection, visiting all the English Colonies, beginning with the Cape and ending with Canada. Mr. Froude's opinions on Colonial government are well known, and we may look forward to a valuable report on his return from his journey round the world.

SIR TRAVERS TWISS has in the press a second volume of the Appendix to the *Black Book of the Admiralty*. It will contain the Judgments of the Sea from the earliest known MS., which is preserved in the Archives of the Guildhall of the city of London, collated with an early Flemish MS. of the fourteenth century in the Archives of the city of Bruges, as well as the Customs of the Sea from the earliest Catalan version of the Book of the Consulate of the Sea, collated with the earliest known MS. in the Bibliothèque Nationale in Paris. The Introduction will contain an account of the recent discovery of the missing Black Book, as well as of the discovery of the long sought for "Tavola Amalphitana" among the Foscarini MSS. in the Imperial Library in Vienna.

MESSRS. BELL AND SONS announce that the fifth and concluding volume of Mr. George Long's *Decline of the Roman Republic*, treating of the period from Caesar's invasion of Britain to his death, is now ready for publication.

The same publishers have in the press six Lectures by Dr. Scrivener on the text of the New Testament and the ancient MSS. in which it is preserved, intended for those who do not read Greek. A new edition of Dr. Scrivener's *Introduction to the Criticism of the New Testament* is likewise in the press.

THE Petrarch Centenary Committee sitting at Aix has received more than a thousand poems in French, Provençal, and Italian. The prizes will consist of gold and silver flowers, crowns, gold, silver-gilt, silver, and bronze medals, cups, &c. The festivities in honour of the poet, who died

July 18, 1874, will be on a very grand scale, and will be continued for three days, beginning on the 18th instant.

THE bibliophile Jacob has just printed from the original manuscript the priced catalogue of the books of M^{me}. Du Barry in her library at Versailles in 1771, when her influence was at its height.

THE French tragic poet Ducis, author of *Abufar*, who died in 1816, is not much known in England. Minute students of French literature, however, may be glad to learn that some passages from his *Diary* have just been published for the first time in the bulletin of the Versailles Library. From some extracts in the *Temps*, it appears that the poet was the hero of a continual domestic tragedy, being ill-treated by his wife, a violent and half insane woman, who made his life a burden. Such, however, was the poet's patience and mildness of disposition, that he attained the ripe age of eighty-three.

THE English Dialect Society will include, in their issue for 1874, a revised edition of Ray's well-known Glossaries of North and South-country words. Mr. Skeat has not only collated the editions of 1674, 1691, and a later one, but added the MS. notes (cited in Halliwell's Dictionary) from Dr. Moore's copy of the edition of 1674 in the British Museum, and a second set of anonymous notes from a copy in the possession of a member of the Society. This reprint of Ray will be a great convenience to many, as copies of it are now scarce.

MR. SWEET'S *History of English Sounds* is being printed for the English Dialect Society as well as for the Philological Society, with the author's permission.

MR. HAROLD LITLEDALE, of Trinity College, Dublin, has undertaken to edit, for the New Shakspeare Society, Shakspeare's play of *The Two Noble Kinsmen*, in which he was largely helped by Fletcher, as he was in his *Henry the Eighth*. Mr. Litledale made a careful independent examination of the play, to distinguish the Fletcher parts from the Shakspeare ones; and, having tabulated his results, found (as many other students have) that they coincided with those of the late Mr. Hickson, printed in 1848 (and reprinted this year by the New Shakspeare Society). Mr. Litledale will, according to the New Shakspeare Society's rules, reprint the first quarto of 1633, and then have a revised edition of it, retaining the old spelling, with Introduction, notes, and a Glossarial Concordance distinguishing Fletcher's words from Shakspeare's. In the text of the play, Fletcher's part will be printed without leads, so as to make its distinction from Shakspeare's part at once apparent to the eye.

A NEW weekly journal is to be started, shortly after the opening of Leicester Square, and to be called *Leicester Square*. It will not only be a local paper; it is to become the organ of rational amusement and play-places for the people; and it will advocate the measures propounded by the Playground Society, in which the late Charles Dickens was so keenly interested.

THE first volume of the cabinet edition of Mr. Tennyson's works has appeared. This edition, for which we are indebted to that most enterprising firm of publishers, Messrs. Henry S. King & Co., is to come out in ten monthly volumes, each of which will be limited to the price of half-a-crown.

A FEW weeks ago we directed our readers' attention to a poem published in the *National Reformer*, as an interesting literary production in some danger of being overlooked owing to the manner and place of its publication. As our esteemed contemporary the *Spectator* has since given its serious attention to our remarks as well as to the poem itself, we ought perhaps to explain more fully the character of merit and the degree

of originality which the poem appears to possess, if considered apart from religious or philosophical bias. It is generally easy to describe a new writer in terms of two or three popular contemporaries, or some one established school, and this cannot be done with B. V.: his versification is often rugged, sometimes careless, but he has good lines—lines, let us say, as good as the good lines of Mr. Swinburne's—that are not at all like Mr. Swinburne, or any other immediate model; and though the author of one original poem is not necessarily a great original poet, the originality of style in this case is real, so far as it goes. The substance of the poem is, in one sense, as old as Ecclesiastes, but there is some novelty in the way in which the author has given form to his conception of the vanity of all things. He does not, like Schopenhauer, maintain dogmatically that life is an evil in itself; he does not, like Leopardi, dwell in detail upon his own sense of its evilness; he has chosen simply to represent that vision of darkness, which is a reality to some minds, especially to those most impressed with the subjective, relative nature of such qualities as light and darkness; and the poetical effect of his ghastly imagery is heightened, because the picture is complete in itself—as a picture—without including a theory, fatalistic or otherwise, of why some people do see the world in shade. That they do is a psychological fact which does not become more painful than before by being treated imaginatively, though there are certainly states of mind in which the contemplation of such images may tend to give an unhealthy permanence to the subjective gloom.

M. JULES JANIN has bequeathed his library to his native town, Saint-Etienne, M^{me}. Janin retaining the use of it during her lifetime. The formation of this library was the work of half a century, comprising, as it does, from six to seven thousand volumes. Besides admirable editions, Aldines, Elzevirs, Robert Estiennes, and some fine copies of the poets of the fifteenth, sixteenth, and seventeenth centuries, it contains copies, on Dutch or Chinese paper, of all the works of importance which have appeared for the last forty years. Authors, knowing the fondness of the celebrated critic for good books, had complimentary copies printed for him, with dedications in prose or in verse. Jules Janin made it a duty and a pleasure to have them richly bound by the most celebrated binders, such as Trautz-Bauzonnet, Duru, Capé, Gayler-Hiron, Petit, &c. Some of these dedications are real manuscript prefaces. Under the cover of most of the volumes is to be found a letter from the author. A copy of *Jocelyn* contains, besides the dedication, four pages of manuscript written by Lamartine. There are some unique copies. The publisher Curmer had printed, solely for Janin, a single copy of a splendid book ornamented with original designs. This library is a veritable literary and artistic treasure for the town of Saint-Etienne.

THE second half-yearly part of the Palaeographical Society's autotype Facsimiles of Ancient Manuscripts has recently been issued. It is edited, like the first, by Messrs. Bond and Thompson, and contains eleven well-executed plates, making a total for the first year's issue of twenty-four facsimiles, each accompanied by a copy in letterpress, and a careful description of the MS. from which it is taken. Looking, therefore, to the quantity as well as the quality of the return for the guinea subscription, we are not surprised to learn that the Society's numbers have for some time been complete. The manuscripts represented in the part are: 14-15. Codex Bezae (Cambridge), sixth century; 16. Gospels (Harley MS. 1775), sixth or seventh century; 17. Gospel of St. John (Stoneyhurst), seventh century; 18-19. Psalter of St. Augustine's, Canterbury (Cotton MS. Vesp. A. 1), about A.D. 700; 20-21. Gospels of St. Chad (Chapter of Lichfield), about A.D. 700; 22. Lindisfarne Gospels (Cotton MS. Nero D. IV.), about A.D. 700; 23. Decree of Aethelheard, Abp. of

Canterbury (Chapter of Cant.), A.D. 808; 24. Charter of Berchtwulf, king of Mercia (Chapter of Cant.), about A.D. 848. The two plates from the bilingual Codex Bezae, one of which represents the Greek text and the other the Latin, are especially interesting, taken as they are from one of the oldest and most remarkable of the extant MS. copies of the Gospels and Acts of the Apostles. Of scarcely less interest are the Gospels of St. Chad (Pl. 20, 21), a fine MS. in a bold half-uncial hand, the characteristics of which, as well as of the ornamentation, are Irish. The second of the two plates represents a full-page portrait of St. Luke, seated in a chair, and holding in one hand a cross, in the other a staff with an elaborate interlaced head. We hope to see in future parts additional facsimiles from this volume, among others the cruciform design on the leaf following the portrait of St. Luke, which in beauty and skilful execution is second only to that from the Lindisfarne Gospels given in Part I. As regards the history of the MS., a note in a hand of the ninth century states that it was purchased by a certain Gelhi in exchange for his best horse, and dedicated to God and St. Teilo, patron saint of Llandaff. The first entry connecting it with the cathedral church of St. Chad is that of the name of Winsy, Bishop of Lichfield in 973. In the Gospel of St. John (Pl. 17), now the property of Stoneyhurst College—a beautifully written little volume, not six inches high—is an extremely interesting note, written about A.D. 1300, recording the tradition that the MS. was found in the tomb of St. Cuthbert, who died in 687. Pl. 18, from Cotton MS. Vesp. A. 1, is also a very beautiful specimen of handwriting. The characters are sharply defined uncials; but the first line of the psalm, of which the page contains the beginning, is written in large ornamental letters. The other page from the same MS. (Pl. 19), is from part of a homily of St. Basil, prefixed to the Psalter, and is written in fine slender rustic capitals. The page from the Lindisfarne Gospels (Pl. 22) is from the beginning of St. Luke, and the beauty of the initial letter and the border is equal, if not superior, to that of the pages from the beginning of St. Matthew and St. John which were reproduced in Part I. As objection might possibly be made to the almost exclusively theological character of the MSS. in the present part, we may state that facsimiles from early copies of Livy and Terence in the Bibliothèque Nationale would have been included but for an accidental delay in the transmission of the plates. The support which the society has received from the authorities of the Paris and other foreign libraries deserves cordial recognition, and leads us to hope that in course of time faithful facsimiles of all the chief MS. rarities of the continent, not excepting those in the Vatican itself, may be placed within the reach of all who take an interest in palaeography.

THE Norwegians have suffered so much from hot-headed people who have advocated the abandonment of the use of classic Danish in favour of the rude peasant dialect of Norway, that *Morgenbladet* takes a grim pleasure in describing a most grotesque effort of a parallel kind which is being made in America. A certain Swede, it appears, Frantz Hermann Widstrand by name, has made himself famous in his own town of Monticello, somewhere in Wisconsin, by writing a very laudatory life of himself. The success of this daring and original enterprise has determined him to try a bolder flight, and accordingly he has submitted to Congress, by Senator Ramsay, a scheme for the discontinuance of the English language throughout the States. Herr Widstrand is of opinion that it is unworthy of a great and independent nation to make use of any of the tongues originated in that effete Europe that now totters into its dotage; and it is not English only, but German, French, and even Swedish, that he wishes to banish. He desires Congress to command the people of the States to acquire a grace-

ful, easy language, that he, Herr Widstrand, has invented, and suggests that July 4, 1876, should be celebrated by the final expulsion of the English language from the States. Congress is said to have sent the proposition into committee, but that must be *Morgenbladet's* fun. It is not stated whether any proposal is afloat to enquire into the condition of Herr Widstrand's mind.

DR. HÖFFDING, who is the Danish author of a rather clever book on German Philosophy since Hegel, publishes this spring *Den engelske Filosofi i vor Tid* (English Philosophy in our Time). He considers that contemporary English writers have added thought of no small importance for the wider development of philosophy and the working out of its universal problems. He then sketches the labours of the "empirical school" under John Stuart Mill and Alexander Bain, then the critical school, in which he includes Whewell, Hamilton and Mansell, and lastly gives a good deal of space to the system of Herbert Spencer, in which he sees a development higher than either school, and in its leader a man who promises to create a new epoch in thought.

We give here a few selections from a manuscript volume which has been lent to us, purporting to be a "Catalogue of all the Books entered in the Register Book of the Company of Stationers, London, from the 26th day of March, 1676, to the 24th day of October, 1678." It is a contemporary copy, made by John Lilly, Clerk of the Company, and is a curious testimony to the literary activity of those times. The entries in all number about 145, during the two years and a half over which it extends:—

1676

June 15. By licence under the hand of Mr. Lestrage, A Play entitled *The Man of Mode, or Sr Fopling Flutter*, a Comedie written by Geo. Ethoridge, Esq.

" " By licence under the hand of Mr. Lestrage, A Play entitled *Don Carlos, Prince of Spaine*, A Tragedy as it was acted at the Duke's Theatre written by Jo. Ottway, Esq.

1676

August 9. By licence under the hand of Mr. Lestrage. A Small Tract entitled *Wonderful News from Bristol* A true yet Prodigious Relation how a Hen on y^e 3d of July last brought into y^e World a Kitling or young Catt to the unspeakable admiration of many People present.

10. By licence under the hand of Mr. Secretary Coventry, a Book entitled *The Memoires of James Duke of Hamilton*, by Gilbert Burnett, Chaplain in Ordinary to his Ma^{ty}

26. By licence under the hand of Mr. Smith A Book entitled *Cockers Arithmetick Vulgar &c. Decimall &c.* being the Production of 20 yeares study by Edward Cocker. [A copy of this, the first edition, belonging to Sir Wm. Tite, has just been sold for 14*l.* 10*s.*]

November 7. By licence under the hand of Mr. Lestrage, England's Improvem^t by sea & land, To out doe y^e Dutch without fighting, to pay debts without money, and to set at worke all y^e Poore in England &c. by Andrew Yarranton, Gent.

December 2. By licence under y^e hand of Mr. Lestrage, a Brief History of y^e Wars with the Indians in New England from June y^e 24th 1675, when y^e First englishman was murdered by the Indians to August 12. 1676 when Philip alias Metacomett, the Principal author of y^e Warr was slaine, written by Increase Matther, Teacher of a Church of Christ at Boston in New England.

1676-7

February 8 By licence under y^e hand of Mr. Lestrage, a Play called *Titus* and

Berenice, A Tragedy acted at y^e Duke's Theatre, with a Farce called the Cheates of Scappin, by Tho. Otway Gent.

1677

March 29 By licence under y^e hand of Mr. Lestrage The Workes of the Greate Politician Nicholas Machiavell Citizen and Secretary of Florence.

April 13 By licence under the hand of Mr. Lestrage A Comedy called the Country Innocence, or the Chamber Maid turn'd Quaker, by John Leonard.

18 By licence under the hand of Mr Sill A short French and English Dictionary, together with a New French Grammar for English to learn French, And an English Grammar for Forreigners to learne English by.

1677.

May 4. By licence under the hand of Mr. Lestrage, Anthony & Cleopatra. A Play written by y^e hono^{ble} S^r Charles Sedley, Bar^t

July 7. By licence under the hand of Mr. Lestrage, A Play called the Rover or the Banish't Cavalier, As it was acted at the Duke's Theatre, written by Mrs. A. Behn.

August 22. By licence under the hand of Mr. Lestrage, Hudibras, The Third and last part by y^e Author of y^e first & second parts.

November 2. By licence under the hand of Mr. Lestrage, A just and seasonable Reprehension of Naked Breasts and Shoulders written by a Grave and learned Papist. Translated by Edward Cook Esq., with a Preface by Mr. Richard Baxter.

THE Rev. Canon Edmunds (Durham) is about to publish a short critical commentary on St. Paul's Epistle to the Galatians. The text followed is that of Lachmann, checked by that of Tischendorf, and by the Alexandrian, Vatican, and Sinaitic MSS. The volume is intended specially for the use of theological students and of pupil-teachers.

THE *Cornhill Magazine* has one very interesting paper on the writings of Leih-tsze, a philosopher of the fourth century B.C. by "F. S. T." He was a Taonist, that is, an adherent of Laon-tsze, the contemporary and rival of Confucius, whose watchword was *taon*, "the path," by which some attempt to understand "the ideal unity of the universe," though "the course of nature" is at once a more literal and more intelligible rendering. Leih-tsze was a sceptic and a fatalist, and in his writings the doctrine of spontaneity, or passive fulfilment of the instincts of nature, preached by the founder of Taonism, assumes occasionally the appearance of immoral indifference. At the same time, many of the anecdotes told of him have the obvious purpose of contrasting his practical geniality with the melancholy conscientiousness of Confucius; and though the school to which he belonged subsequently sank into obscure trifling with magic and mysticism, his own credulity began with a semi-rational enthusiasm (not unlike Bacon's) for the miracles possible to human thought and will. The following is one of the best of his stories: "A stupid countryman, ninety years of age, had his dwelling on the northern slope of a lofty mountain range, two hundred miles long and ten thousand cubits high. One day he was struck with the thought that a road to the south was eminently desirable, so he called his family together and proposed to level the precipices, and make a road through to the southern waters. His wife remonstrated, hinting that the old man's strength would not suffice to demolish a hillock, let alone those great mountains. But the old man was not daunted; and leading on his son and grandson, the three of them began to pick and dig, and to carry away the stones and earth in baskets, and an old widow sent her child

of seven years old to help them. Winter and summer they toiled away, and after a whole year seemed to be where they began. A shrewd old grey-beard mocked their slow progress; but the stupid countryman replied with a sigh: 'Your heart is not so intelligent as that of this widow's feeble child. Although I am old and shall die, I have a son, and he has a son; these will have children and grandchildren. My posterity will go multiplying without end, and the mountain will not grow bigger. What is to prevent our levelling it?' The old man had nothing to say, but the spirit which presides over snakes heard what was said, and fearing that the work would not stop, reported the matter to God. God was affected by their sincerity, and commanded two genii to remove the mountains, shifting one to the east, and another to the south, so as to open a pass to the river Hau."

In the *New Quarterly Magazine*, a paper on *Habit in Plants*, by H. Evershed, brings together a few interesting particulars about the difficulty some plants have in accommodating their times and seasons of growth to a change of place; but its chief value is as an illustration of the ease with which vegetable species may be personified in thought and credited with much practical reason and ingenuity. Mr. Banks's reminiscences of the strange birds and beasts he has succeeded in taming will interest other unscientific naturalists. Among the "Notes of Travel in Portugal," there is a story of a remarkably ingenious swindle perpetrated by a famous, still living *chevalier d'industrie*, whose name has enriched the Portuguese language with a new term for that profession, *Feijardismo*, a word, according to the writer, already familiar throughout all Portugal and Brazil.

MR. GLADSTONE'S second article on Homer in the *Contemporary Review* wraps up two important facts—that the Homeric poems and the Trojan War seem to belong to the period when Thebes was the capital of Egypt, and Sidon the great city of the maritime Canaanites; and one ingenious conjecture, that Memnon's Keteioi were the Egyptian Kete and the biblical Hiittites—in a cloud of minute ingenuity a good deal of which is quite out of date. Mr. Simpson's delicate and appreciative study of Petrarch is perhaps rather needlessly apologetic in style, as most readers of the present day are free from a dislike of his verbal trifling so strong as to interfere with their enjoyment of his higher, sincerely passionate strains. It is well observed, however, that the passion of Petrarch does really differ from that which bears the same name in modern literature. Consisting in its essence of devotion to a higher being, the picture of it is without all the effects of reciprocity that are necessary to give the appearance of reality to the representation of such emotional relations now.

MR. A. C. LYALL, in the *Fortnightly Review*, maintains, in reply to Professor Max Müller's lecture on Missions (as reported in the *Times*), that Brahminism is not a dead religion, and that it proselytises more successfully than any other religion in the present day. As Professor Max Müller points out in a note appended to Mr. Lyall's article, a religion to which proselytes are admitted is not necessarily a missionary religion in the sense in which Buddhism and Christianity, and even Mahometanism are missionary religions; but this does not affect the importance of the facts by which Mr. Lyall proves Brahminism to be a living and growing faith; growing by the absorption of non-Aryan tribes into the Hindu community, and by the influence of individual devotees, who form sects mainly out of the disinherited classes, which ultimately are reabsorbed into Brahminism. Mr. Lyall seems to imply, in contradiction to most recent authorities, that Mahometanism is stationary or declining in India.

PROFESSOR COWELL, in *Macmillan's Magazine*, gives us some dozen well-chosen translations from

Háfiz with a very unsatisfactory introduction. We have been told quite often enough that Háfiz was not, as Sir William Jones supposed, the Persian Anacreon, and that the strictest Sufis managed to read their own austerity into his poetry; as for that matter, St. Gertrude spiritualised the Low Country version of Gudrun's "Lamentation for Siegfried," and St. Teresa spiritualised the language of contemporary Spanish pastorals; what we want to know is how Háfiz and many other Persian poets came to seek in excess, at least in libertinism, the religious rapture and exaltation which orthodox devotees and poets sought in asceticism. In the same periodical Mr. Oxenford paraphrases a version of the Estonian epic, or legend of Kalewipoeg (the son of Kalew), whom he styles "the Estonian Hercules," though the only one of his labours that can be called profitable to mankind is his introducing agriculture in Wiros (Estonia), by draining the marshes and ploughing the plains with a colossal plough that no one but himself could guide. The rest of his adventures are encountered in search of his mother, who has been removed to the realm of shades. He buys a magical sword of marvellous temper, but slaying with it one of the smith's sons, it is cursed, and ultimately causes his death. As in the *Kalewala*, there is a good deal of wild, apparently late invention mixed with the primitive framework, and nothing but a literal translation gives the reader a chance of discriminating, even approximately, between the two elements.

NOTES OF TRAVEL.

THE discoveries made by H.M.S. *Brisk* in New Guinea appear to be very important. It is now found that what was formerly supposed to be the north portion of the island is an entirely separate island, and between the two is a passage that will considerably shorten the route from Australia to China.

A COMMISSION appointed by the Ottoman Government has declared that true plague has broken out in the neighbourhood of Bagdad. Quarantine has been established round all the affected districts. It is worthy of note that a similar outbreak took place in the same district in 1867, caused then, as now, by severe privation among the inhabitants.

By private advices which have reached England, dated Ujiji, February 28, and which have therefore arrived in a wonderfully short space of time, we learn that Lieutenant Cameron had reached that place in safety, and was preparing for a speedy departure. He speaks in the highest terms of an india-rubber boat he took with him, made by Mathews & Son, of Charing Cross, and of two bell-tents, similar to those used in the Abyssinian campaign, than which we know, by personal experience, nothing can be better adapted for travelling.

ANOTHER mark of the state of feeling now existing on the East Coast of Africa has just been furnished in the murder at Magadoxo of a European who had resided there for some years. We have received no particulars as yet; but this is certainly one result of the policy which has not insisted on the execution at Zanzibar of the murderer of Lieutenant McCausland, and which has led the Arabs to believe that all the anti-slave-trade operations were so much moonshine.

WE understand that Colonel Gordon has sent home an application from Gondokoro, to the effect that two officers of the Royal Engineers may be sent out to join him forthwith. It is believed that Colonel Gordon hopes to be on the Great Lake about November next.

THE plans for the rehabilitation and modernisation of ancient Rome include designs for the construction of a harbour, the erection of an extensive

line of warehouses, and the opening of a railway at Fiumicino, near Porto, Trajan's ancient port, which inundations of the Tiber and accumulations of sand have for ages rendered wholly unfit for trading purposes. According to an agreement recently concluded between the Prince Alessandro Torlonia on the one hand, and the Signors Nocchioli of Rome, and Semenza of Milan on the other, a large tract of land, lying between Fiumicino and the right arm of the Tiber has been ceded by the former to the latter, for the purpose of being drained and applied to the specified purpose of creating an efficient and commodious trading port, which may prove to modern Rome—with due regard to the requirements and improvements of the present day—what Ostia and Portus were to the ancient city. Every appliance of science is to be brought to bear on the contemplated scheme, and, in accordance with the special stipulations of the Prince, a station is to be erected near his own villa on the Fiumicino line, and the so-called Lago Traiano and the marshes of the Campo Salino are to be drained.

WE learn from *Le Cosmopolite*, a useful little journal appearing weekly in four languages at Geneva, that the Alpine Club of French Switzerland have selected a peak between the Schwarzssee and Galmis, named in General Dufour's map as "Kleine Brünnen," for their excursion this year. The peak, called in the district "Grosse Brünnen," is about 7,000 feet high, and forms the centre of a mountain region well worth exploration. It can be ascended by three roads, the most pleasant being that leading over La Villette. The *ascensionistes* of Vaud, Geneva, Valais and Friburg, had a meeting, recently, at Galmis. The "Tödi," "Rhätien," and "Uto" sections of the Swiss Alpine Club intend to ascend the Alvier.

AT the last meeting of the Dutch Geographical Society it was unanimously resolved to send a scientific expedition to Sumatra, to explore the unknown portion of that island. The cost is expected not to exceed 2,000*l*.

IT is said that on February 16, the body of the Russian courier from Peking to Kiachta was found frozen to death in the snows of the Mongolian desert. Although this postal service has now been carried on for many years, we believe that such an accident has never happened before.

WE hear that measures are being taken to examine the diamond fields of Sarawak. Coal mining, too, is being actively carried on in that country, and Rajah Brooke's Government are working some mines on their own account.

A SIGNIFICANT comment on the benefit that has accrued to Persia from the Shah's late visit to England, is furnished in the account we have lately read of the determined attack made by highway robbers on Captain Napier's party, between Bushire and Shiraz. After a severe fight the escort and party were overpowered, one sowar being killed and two men severely wounded, and all the property plundered. Though redress will in this instance be, of course, exacted from the Persian Government, we can remember the time but very lately when such an occurrence would have been nearly impossible. But a very short time ago an English officer could travel all over Persia alone and unprotected with perfect safety. Misrule and neglect have, however, to answer for the absolute insecurity to life and property which characterises existence in Persia, as for many other evils; and there is no sign whatever of the approach of that millennium which enthusiasts assured us would be brought about in Persia directly the Shah had time to develop the impression produced by his European experiences.

TRAVELLERS intending to visit Germany in the course of the present year will be interested to know that a general map of Germany and the adjacent lands has just been published by Messrs. Rieger, of Munich, under the immediate direction and supervision of Herr J. G. Mayr,

Inspector of the Topographical Bureau of the Royal Bavarian Staff Department. This chart, whose limits include the "Sound" and the Adriatic, gives the most recent information in regard to the railway and steamboat systems established in the various countries, and is enriched with numerous useful statistical and other tables. The Messrs. Nitzsche, of Stuttgart, have also recently put forth a new and improved edition of their well-known *Karte des Deutschen Reichs*, in which all the rivers, railways, and principal high-roads are laid down in well and distinctly marked coloured lines, and may, therefore, be regarded rather as a supplementary adjunct than a rival to Herr Mayr's more compendious chart.

THE serious damage inflicted on the Frisian and Slesvig Holstein coast lands by the inundations of November 12 and 13, 1872, has been the means of drawing the attention of the Imperial German Government to the question of the existing means of defence against the inroads of the sea on exposed coasts. An examination of the dykes and breakwaters of the Dithmarsh and Slesvig Holstein lands has shown that the system of construction hitherto adopted in these districts is radically bad and practically inadequate to the exigencies of the case. At the present moment as many as twenty-four different projects are under consideration for the construction of the necessary sea-defences, which it is estimated will cost about 1,200,000 thalers; but as yet nothing decisive has been arranged, owing in part to the excessively complicated nature of the private as well as State interests involved in the question of proprietary obligations and taxes. All who are familiar with the navigation of the Baltic along its western branches, and of the German Ocean off the coast of Jutland, will be able to appreciate at its full value the enormous importance of the question how to secure the more thorough protection of the low-lying islands and coastlands from the further encroachments of the sea. Even the most unobservant of travellers must have noticed that nothing save the most prompt and effectual system of permanent breakwaters can rescue these districts from the fate of being in time—and probably at no very remote period—utterly silted up and engulfed in sand.

The following strange story has, says the *Home-ward Mail*, been communicated to the Indian papers:—

"We had left Colombo in the steamer *Strathoven*, had rounded Galle, and were well in the Bay, with our course laid for Madras, steaming over a calm and tranquil sea. About an hour before sunset on May 10, we saw on our starboard beam and about two miles off, a small schooner lying becalmed; there was nothing in her appearance or position to excite remark, but as we came up with her, I lazily examined her with my binocular, and then noticed between us, but nearer her, a long, low swelling, lying on the sea, which from its colour and shape I took to be a bank of seaweed. As I watched, the mass hitherto at rest on the quiet sea was set in motion. It struck the schooner, which visibly reeled, and then righted; immediately afterwards the masts swayed sideways, and with my glass I could clearly discern the enormous mass and the hull of the schooner coalescing—I can think of no other term. Judging from their exclamations, the other gazers must have witnessed the same appearance. Almost immediately after the collision and coalescence the schooner's masts swayed towards us, lower and lower; the vessel was on her beam end, lay there a few seconds, and disappeared; the masts righting as she sank, and the main exhibiting a reversed ensign struggling towards its peak. A cry of horror arose from the lookers on; and, as if by instinct, our ship's head was at once turned towards the scene, which was now marked by the forms of those battling for life—the sole survivors of the pretty little schooner, which only twenty minutes before floated bravely on the smooth sea.

"As soon as the poor fellows were able to tell their story, they astounded us with the assertion that their vessel had been submerged by a gigantic cuttle-fish or calamary, the animal which, in a smaller form, attracts so much attention in the Brighton Aquarium

as the Octopus. Each narrator had his version of the story, but in the main all the narratives tallied so remarkably as to leave no doubt of the fact.

"As soon as he was at leisure, I prevailed on the skipper to give me his written account of the disaster, and I have now much pleasure in sending you a copy of his narrative: 'I was lately the skipper of the *Pearl* schooner, 150 tons, as tight a little craft as ever sailed the seas, with a crew of six men. We were bound from the Mauritius to Rangoon in ballast to return with paddy, and had put in at Galle for water. Three days out we fell becalmed in the Bay (lat. 8° 50' N. long. 81° 5' E.); on May 10 about 5 p.m. (eight bells I know had gone) we sighted a two-masted screw on our port quarter, about five or six miles off; very soon after, as we lay motionless, a great mass rose slowly out of the sea, about half a mile off on our larboard side, and remained spread out as it were and stationary: it looked like the back of a huge whale, but it sloped less, and was of a brownish colour: even at that distance it seemed much longer than our craft, and it seemed to be basking in the sun. 'What's that?' I sang out to the mate. 'Blest if I know; barring its size, colour, and shape, it might be a whale,' replied Tom Scott; 'and it ain't the sea serpent,' said one of the crew. 'For he's too round for that ere crittur.' I went into the cabin for my rifle, and as I was preparing to fire, Bill Darling, a Newfoundlander, came on deck, and looking at the monster, exclaimed, putting up his hand, 'Have a care, master, that ere is a squid, and will capsize us if you hurt him.' Smiling at the idea, I let fly and hit him, and with that he shook, there was a great ripple all round him, and he began to move. 'Out with all your axes and knives,' shouted Bill, 'and cut at any part of him that comes aboard; look alive, and Lord help us!' Not aware of the danger, and never having seen or heard of such a monster, I gave no orders, and it was no use touching the helm or ropes to get out of the way. By this time three of the crew, Bill included, had found axes, and one a rusty cutlass, and all were looking over the ship's side at the advancing monster. We could now see a huge oblong mass moving by jerks just under the surface of the water, and an enormous train following: the oblong body was at least half the size of our vessel in length and just as thick; the wake or train might have been 100 feet long. In the time that I have taken to write this the brute struck us, and the ship quivered under the thud; in another moment, monstrous arms like trees seized the vessel, and she heeled over; in another second the monster was aboard, squeezed in between the two masts, Bill screaming, 'Slash for your lives!' but all our slashing was of no avail, for the brute, holding on by his arms, slipped his vast body overboard, and pulled the vessel down with him on her beam ends. We were thrown into the water at once; and just as I went over, I caught sight of one of the crew, either Bill or Tom Fielding, squashed up between the mast and one of those awful arms. For a few seconds our ship lay on her beam ends, then filled and went down. Another of the crew must have been sucked down, for you only picked up five. The rest you know. I can't tell who ran up the ensign.

"JAMES FLOYD, late master, schooner *Pearl*."

THE LATE MR. C. F. TYRWHITT-DRAKE.

By the death of my dear friend and kindly fellow-traveller, Charles F. Tyrwhitt-Drake, geographical science has sustained no common loss. Seldom has a career of brighter promise been brought to an untimely close; for, though barely thirty years old, he had already done enough to place him in the front rank of explorers; while the experience he had gained and his intimate knowledge of Oriental languages and character would, it was hoped, have produced the most important results to science, and especially to our knowledge of the Holy Land. But, like many another young enthusiast, he has fallen a victim to his too ardent devotion to the pursuit of knowledge; overwork in a baneful climate had already shaken his naturally robust constitution, and on Tuesday, June 23, he succumbed to an attack of typhoid fever, and died at Jerusalem. Destined originally for the Church, he entered at Trinity College, Cambridge, but was compelled by a chronic asthma to leave the university without

taking a degree, and seek a change of climate. For several years he wintered in Morocco, where he indulged in his passion for sport and taste for natural history. In 1863 he travelled up the Nile, and subsequently visited Sinai just as members of the Survey Expedition were on the point of leaving the Peninsula. In the following year, aided by a grant from his university, he joined me in the exploration of the Tih (or "Wilderness of the Wanderings") and the countries east of the Arabah, after which we visited together most of the places of interest in Palestine and Syria, returning home by Greece and Turkey. The next winter he again proceeded to Syria for the Palestine Exploration Fund, and explored many of the unknown parts of the country in company with Captain Burton, in conjunction with whom he published a work entitled *Unexplored Syria*. From that time until his death he was attached to the service of the society, and engaged upon the survey of Palestine now in progress. His reports published in the Quarterly Statements of the Palestine Exploration Fund, and noticed from time to time in the metropolitan journals, testify to the energy and perseverance with which he performed his task, and we are indebted to his discoveries for much additional light upon the geography and archaeology of the Bible. Of his private worth I cannot trust myself to speak at length—the memories of affectionate intercourse and brotherly tenderness crowd too thick upon me. For eleven months we lived together in one little tent; and, amid dangers, privations, and annoyances which would have tried the temper of most men, I never once heard from him an unkind or petulant word—never found him other than a frank, true friend, a sympathetic and cheerful companion, and an ardent, untiring fellow-worker.

CORRESPONDENCE.

DR. R. MORRIS AND DR. WEYMOUTH.

1 Cintra Terrace, Cambridge.

In the late correspondence in the ACADEMY between Dr. Morris and Dr. Weymouth, the latter refers to me as identifying the Moeso-Gothic *tau-*

jan with the English *do*. On referring to my Moeso-Gothic Glossary, I am sorry to find that I certainly did make this mistake once, but it was a slip, and I should not think of attempting to sustain the identification. The Moeso-Gothic *taujan* is, as I now believe, obviously the same word with the Old High German *zarjan* or *zowjan*, to make or prepare, which is the A.S. *tauian*, to prepare, still used in the phrase "to *tau* leather." This is quite distinct from the E. *do*, G. *thun*, variously spelt *tôn*, *dôn*, *tuan*, *duan*, &c., in Old High German; of which the past tense plural, *tatumes*, *tatut*, *tatun* (Graff, v. 288), bears so striking an analogy to the Moeso-Gothic past-tense plural weak-verb suffixes, *-dedum*, *-deduth*, *-dedun*, that it can surely not surprise us to find Professor Max Müller asserting their identity, and explaining the suffix *-ed* in *loved* as meaning *did*. The word *did* itself is best explained as a mere reduplication, so that *did* = *do* + *do*, and not = *do* + *did*, as Dr. Weymouth supposes for the purpose of denying the supposition. Whilst agreeing with Dr. Weymouth that it is very proper to carry on discussions in a kindly spirit, I do not see that he has made any substantial impression on Dr. Morris's arguments. But my object in writing this letter is not to provoke any further discussion, which would, I fear, lead to no good result, but simply to own that, in connecting *taujan* with *do*, I went astray, and regret having done so.

WALTER W. SKEAT.

DICTIONARY AND GLOSSARY OF THE KORAN.

Hotel Bellevue, Willbad, Württemberg:
June 27, 1874.

Before leaving England, my attention was called to a notice of the above work, which had appeared a short time previously in the ACADEMY. It is at all times difficult to combat a "suspicion," but while leaving you to trace as many points of resemblance as may exist between my book and Lane's Dictionary, I must ask you to allow me most emphatically to deny the imputation of being a plagiarist.

I have omitted all mention of Mr. Lane's Dictionary, because *nothing* has been borrowed from that source. The fact is that, however meagre the result may appear, my book occupied me more than three years in compiling, having been commenced in 1867; the materials were for the most part collected at different periods long before. At the time that I made up my mind to publish, but little (I believe), if any, of Lane's Dictionary was in print; at all events, I had never seen it; and although, doubtless, had the work been complete, I might, by referring to it, have saved myself a vast amount of trouble, it would never have occurred to me to do so without acknowledgment. That we should in many instances have selected the same passages in illustration was no more than might have been expected; a large proportion of those I have quoted having done similar service long ago. I don't know that I need say any more; I can only express a hope that you will not refuse the same publicity to my letter as you have given to the article to which it is a reply.

J. PENRICE.

EVE AND THE RIB.

British Museum: June 27.

It has given me no little pleasure to find that so high an authority as Professor Max Müller agrees with me in declining, at least for the present, to give his assent to Dr. Kleinert's ingenious theory; and still more to find that the suggestion I threw out in my last letter as to the selection of the rib in preference to other bones had before been proposed by Professor Max Müller, a fact of which I was quite ignorant, otherwise (I need scarcely add) I should have mentioned it. I had not seen the solution I suggested anywhere published, and it seemed to me a very obvious mode of explaining the choice of the rib in the allegorical account of the creation of Eve.

STANLEY LANE POOLE.

PROCTOR'S "UNIVERSE AND COMING TRANSITS."

2, North Road, Clapham Park, S.W. :
June 27, 1874.

As Mr. Christie, at p. 722 of the *ACADEMY* for June 27, impugns what he describes as my "attempt to persuade the public" that my views respecting the transit have been adopted, I beg you to accord me space to justify myself.

I opposed three points in Sir G. Airy's original programme: the suggested search for Antarctic stations whence to observe the transit of 1882; the statement that Halley's method "fails totally" in 1874; and the omission of North Indian stations. (See *Monthly Notices of the Astronomical Society*, vol. xxix., pp. 33-42.) The first point was given up, not (as Mr. Christie supposes) after the Admiralty had stated their views, but when my objections were urged, several months later. As to the second, Halley's method is now to be applied at four of the originally selected stations, and also at Peshawur. For, thirdly, North India is now to be occupied by an observing party.

These facts justify my statement that my views have been adopted. But, if I had to admit the reverse, it would only be to acknowledge with regret that, owing to such and such causes, other nations had been compelled to undertake England's duty. We know that America, instead of occupying the Delisle stations Tahiti and the Sandwich Islands, goes farther afield to occupy Halleyan stations; we know that France will not occupy the Marquesas Islands and Suez, which should be hers, but less pleasant Halleyan stations; and we know that America, France, and Germany, between them, will occupy the islands Campbell, St. Paul's, Heard, and Crozet, or, in other words, four out of six groups which I named (for reconnaissance only) four years ago, and which the Hydrographer to the Admiralty described last year as for the most part mere myths. But shall I, an Englishman (now that science, which is of no nation, is satisfied) find in these facts the unpleasant significance which Mr. Christie seems to insist upon? In reality, he rebukes me for no longer expressing dissatisfaction with his chief's measures. Is this wise?

The *Challenger's* results cannot possibly affect my position. I recommended reconnaissance only, and not even reconnaissance for Enderby and Sabrina, whereas Sir G. Airy, in 1864, recommended the occupation of Sabrina Land, and in 1865 substituted Victoria Land (known to all students of Antarctic travel to be inaccessible). No one, so far as I know, has suggested the possibility of "landing on ice," except the Astronomer Royal, who, in 1857, after recommending Wilkes' Land (*sailed over* by Sir Jas. C. Ross in 1846-7), remarked that "firm ice would be quite as good for these observations as dry land." (*Monthly Notices* for 1857, p. 216.) I will venture, by the way, to say that if the transit had taken place twenty years earlier, our country would have shown the way to all the nations in unmistakable sort.

Mr. Christie's remark that "there is probably no more reprehensible practice" than that of re-printing essays without adequate revision, is rather stronger than the occasion would require, even if inadequacy of revision were admitted. The preface to my *Essays on Astronomy* indicates my sufficient reason for re-printing. I have thought it necessary in some cases to leave passages untouched in essays of an early date, lest I should seem to antedate new views. However, Mr. Christie (who treats me very fairly, except where "class bias" unconsciously affects him) acknowledges that my "book shows more signs of careful correction than is usual in such productions." I may explain that the reason why I have "not seen fit to present a complete treatise" on the universe, is simply that a promised work is still unfinished, and must remain so till I have collected and tested certain necessary evidence. It has been chiefly as a supplement to that future work that I have collected together my essays on the

same subject, treating certain points more fully than would be convenient in the treatise itself.

RICHD. A. PROCTOR.

MR. STORY'S STATUES.

Rome: June 20, 1874.

Referring to an article on Mr. Story's *Semiramis*, and to another on the *Medea* of the same artist, in the *ACADEMY* of May 2, and May 9, 1874, I presume that the following list of the works of this eminent sculptor, which I have reason to believe to be complete, will possess interest for the readers of the *ACADEMY*:—

Sitting Figures.	Standing Figures.
Cleopatra	Judith
Lilyan Sibyl	Medea
Semiramis	Dalilah
Sappho	Helen
Cumaean Sibyl	Vesta
Polyxena	Electra
Saul	Alecestis
Bacchus on Panther	Little Red Riding Hood
Fauness and Satyr	Bacchus
Shakespeare	Venus
1st Beethoven	2nd Beethoven
Jerusalem	Phryne
Salome	Lady Macbeth (sketch)
Love and Sphinx	Hero
Mr. Justice Story	Arcadian Shepherd
George Peabody	Edward Everett
	Josiah Quincy
	Marguerite

GEORGE P. MARSH.

THE AUXILIARY "DO."

1 Cintra Terrace, Cambridge: June 29, 1874.

I find that Mr. Furnivall regards the auxiliary use of the verb *do* as having arisen from the causative use of it. That is, no doubt, true to a certain extent, but I think he has overlooked a still simpler solution, viz., that the auxiliary use of the verb arose from a simple *ellipsis* of the governed verb. What I mean will appear more clearly from the following examples, which are considerably earlier than any he has given.

In *Havelok the Dane*, about A.D. 1280, in l. 2448, we have—

"But dunten him so man *doth* bere,"

i.e., but they struck him as people *do* a bear; where *doth* is for *doth dint*, and is a real auxiliary verb, as it supposes an ellipsis of *dint*; although *doth dint* might have been equivalent, at that date, to *cause to be struck*. In l. 1994 we have a still clearer case—

"He folwede hem so hund *dos* hare,"

i.e., he followed them as a dog *does* a hare, where *does* is simply short for *does follow*.

But there are also instances in which it is hard to say whether the verb is causative or not. Thus, in l. 1840—

"Thanne men *doth* the bere beyte"

would in modern English be simply "when men *do* bait the bear;" but in early times it was rather more near to the sense—"when men cause the bear to be baited."

We may find examples still earlier, viz., in the *Ormulum*. I would particularly draw attention to l. 10,736:—

"Forr niss nan mann thatt afre magg meocnesse mare shewenn

Thann he *doth*, whase laghetlith himm binethenn hise lahghre," &c.—

i.e., For there is no man that ever may shew more meekness that he *doth* (i.e., *doth shew*), whosoever lowereth (or abaseth) himself beneath his inferiors.

An example such as this is the more remarkable, because the force of *do* in the *Ormulum* is almost invariably causative, and the word is of very frequent occurrence.

If we may fairly claim the word *doth* in this

passage as practically no more than a mere auxiliary verb, I have carried back Mr. Furnivall's earliest date by more than a century. Perhaps a careful examination of the *Ormulum* would produce a few more instances.

WALTER W. SKEAT.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, July 4,	1 p.m. Sale at Christie's of Pictures from the Collection of the late Sir W. Tite and General Fox, and of important Pictures by Sir Joshua Reynolds.
	2 p.m. Floral Hall Concert.
	3 p.m. Crystal Palace Sixth Summer Concert (Russian and Polish Music).
	8 p.m. First Night of Madame Fargueil in <i>L'Opéra Sam</i> at the Queen's.
MONDAY, July 6,	7 p.m. Entomological.
	8 p.m. First Night of Mademoiselle Agar at the St. James's, in <i>Les Plaidours</i> and <i>Horace</i> .
TUESDAY, July 7,	1 p.m. Sale at Sotheby's of the Second Portion of Engravings and Drawings of R. Cooke, Esq.
	" Sale at Christie's of the Collection of Foreign Porcelain of Percy Robins, Esq.
	7 p.m. Sculptors of England.
	8.30 p.m. Society of Biblical Archaeology: Mr. George Smith—"Account of Recent Excavations and Discoveries made on the site of Nineveh."
WEDNESDAY, July 8,	1 p.m. Sale at Sotheby's of an extensive series of Greek coins of Cities and Princes.
	3 p.m. Royal Society of Literature.
THURSDAY, July 9,	1 p.m. Sale at Christie's of the Collection of Porcelain, Majolica, &c., of the late Rev. John Francis Stuart.
FRIDAY, July 10,	8 p.m. Quckett Club.

SCIENCE.

Sensation and Intuition: Studies in Psychology and Aesthetics. By James Sully, M.A. (London: Henry S. King & Co., 1874.)

THE task of mastering the original works of philosophical inquirers, and reproducing their leading results in forms capable of assimilation by persons of average culture, is an extremely useful one, and its successful performance merits a greater amount of public recognition than commonly attends it. Sidney Smith, when he gave in the *Edinburgh Review* his admirable *résumé* of Bentham's *Book of Fallacies*, exhibited considerable satisfaction at the manner in which the uncouth and unkempt philosopher had, under his hands, been "washed, trimmed, shaved, and forced into clean linen." Mr. Sully, in seeking to popularise portions of the writings of Helmholtz, Spencer, Bain, Darwin, &c., has had to deal with materials free, it is true, from the Benthamite ruggedness of style, but bristling with much greater difficulties of their own. In so far, therefore, as he has succeeded in his aim, Mr. Sully is fairly entitled to an amount of credit proportional to the arduous nature of his undertaking.

The volume before us contains thirteen essays, of which six only are now for the first time published, the rest being reprints from the *Westminster*, *Fortnightly*, and *Contemporary Reviews*. The essays handle a number of exceedingly complex and disputed questions, such as the hypothesis of evolution, the conditions of belief, the doctrine of free will, and the like; and the

table of contents seems, at first sight, to present no obvious connexion between the different chapters. On a closer examination, however, it will be seen that the bearing of physiological and psychological science on aesthetics forms the thread on which the author has strung the most important of his disquisitions. It will be well, therefore, in noticing his work, to keep close to this directing clue.

The opening essay deals with the evolution hypothesis in relation to human physiology. Mr. Sully, while carefully stating the views of the leading evolutionists, seems to allow but little share to their principle in the formation of the mental powers.

"The deeper," he writes, "one's study of the human mind penetrates, the less room will there appear for the play of inherited idea or of instinctive action."

In spite of this, it would seem that his desire to be fair to the opposite view has led him to under-estimate a great inherent difficulty in its method. Thus he draws a parallel between physiological research as subsidiary to psychology, and the study of long and elaborated processes of evolution as subsidiary to physiology in its present state. But this scarcely recognises the essential difference between these two modes of investigation. Physiology affords the means of direct experiment, whereas evolution presents us with little more than precarious inferences from facts ascertained by other methods. Thus physiology and psychology are independent sources of positive data, while evolution is mainly restricted to theorising on the materials accumulated by these more fortunately situated branches of research. Mr. Sully concludes his first essay by showing very clearly that the theory of transmitted ideas affords no basis on which to found the conception of the Absolute. He sums up as follows:—

"It would thus appear that the acceptance of a theory of transmitted ideas, so far from its showing the validity of inference respecting the existence of an Absolute, really enlarges the scope of that kind of psychological analysis which is subversive of the assumption. Assuming that there are emotional and intellectual tendencies in the human mind which serve to generate and foster beliefs not warranted by experience, one may argue that many ideas and apparent intuitions will be liable to be transmitted with greater and greater force, which owe their genesis not to facts of experience, but to the activities of spontaneous imagination. And, if this be so, how can one be logically certain of the absolute existence of Time or Space, Matter or Spirit, the Beautiful or the Good?"

The essay on "New Theories of Emotional Expression" is an interesting summary of Darwin's and Spencer's latest utterances on the subject. Mr. Sully attacks—and, we think, succeeds in demolishing—the former's principle of *antithesis*, according to which, when human actions of one kind have become firmly associated with any sensation or emotion, it appears natural that actions of a directly opposite kind, though of no use, should be unconsciously performed through habit and association under the influence of a directly opposite sensation or emotion.

Those who desire to acquaint themselves with the most important results attained, especially in the field of physiological optics,

by Helmholtz, Weber, Fechner, and others, will do well to study Mr. Sully's third chapter. It contains a minute exposition of the empirical law obtained by the last-mentioned enquirer, and called by his name, according to which the sensation produced by a given nerve-stimulus varies as the logarithm of the stimulus applied. The following quotation is important from the authoritative position occupied by Helmholtz in regard to optical questions:—

"It may be well to point out how these additions to our knowledge of the eye's movements appear to discourage the supposition that the higher orders of voluntary action are aided by connate and instinctive motor abilities. It seems strange indeed that, if an inherited predisposition is produced by the accumulated experience of progenitors, this result does not exhibit itself more conspicuously in the movements of the eye. For Helmholtz is disposed to interpret the greater part of these as the product of repeated tentatives, slowly rectified and relaxed by the guidance of practical needs, and acquired in the course of individual development."

A group of three essays on "The Basis of Musical Sensation," "Aspects of Beauty in Musical Form," and "The Nature and Limits of Musical Expression," appeal to a much wider circle of readers than the select few who take pleasure in abstract metaphysical discussions. For this reason we propose to notice what is likely to prove by far the most generally interesting portion of Mr. Sully's book, with as much fulness as our limits will permit.

To have given the first substantially accurate account of Helmholtz's great acoustical discoveries, in language devoid of scientific technicalities, is an achievement the credit of which, as far as England is concerned, belongs, we believe, to Mr. Sully. This exposition, owing, as it does, hardly anything to graphic or musical illustration, must be considered a decided success, and conveys a really intelligible notion of the composite nature of musical sounds and of the influence exerted by this fact on their combinations. On one point of some importance, however, we must maintain that Mr. Sully does not accurately represent Helmholtz's view. He writes as follows:—

"The delight of a melodious sequence, for example, that of a fifth, is not due to any consciousness of resemblance between the successive tones. The great exception to this truth is to be found in the interval of the octave. Two tones removed by one or more octaves always appear of the same melodic quality, although their difference of pitch is considerable."

Helmholtz does not attribute to the octave this absolutely unique position among intervals. C' is, according to him, more like C than G is, because it contains no partial-tones not already included in the lower clang; but, since G contains a leading partial-tone (the 3rd) of C, it must be admitted, on the same principle, to be more like C than if this were not the case. He appeals to the well known fact that in sight-singing a fifth is frequently struck by mistake for an octave, as practical proof that the latter interval has not the prerogative of unique identity often claimed for it.

In the essay on "Aspects of Beauty in Musical Form," Mr. Sully has given a pleasant and perfectly readable account of

the main elements of form—time, rhythm, pitch, and so forth. A reader previously unacquainted with the subject will derive a considerable amount of information from its perusal, whereas he would, in most cases, be repelled by the technical phraseology with which the ordinary text-books are so needlessly overloaded. While cordially admitting this great merit of the essay, we must not fail to point out some serious defects which more or less detract from its value. Mr. Sully makes assertions which, in the sweeping terms he uses, are erroneous and misleading. For instance, "as is well known, sequences of perfectly similar harmonies, as fifths, are actually forbidden in music" (p. 204).

The common rule against consecutives by no means applies to "sequences of perfectly similar intervals" in general, but *only to octaves and fifths*, and even to these cases subject to definite limitations. It is a pity that, when he had occasion to mention "forbidden" sequences, Mr. Sully did not reproduce the sensible remark of Helmholtz, that there is nothing in music which can properly speaking be called "forbidden." What sounds well is good, whatever pedantic canons may be cited against it. Whatever sounds ill is bad, whatever precedents may be adduced in its support.

Again: "The seventh of the tonic, as is well known, must always ascend to the tonic just above it" (p. 206). There is here absolutely no *must* in the case. If harmonised with the dominant seventh, the seventh of the tonic does indeed *usually* ascend; but it *may* descend, as *e.g.*, when followed by the chord of the tonic with the flat seventh. In other cases it as often moves down as up, as, for instance, at the third chord of the Hundredth Psalm.

The following statement, if not so palpably erroneous as those already quoted, appears to run counter to the commonest experience:—"Every transition (*i.e.*, change of *pitch*) presents itself to the practised ear as a multiple of the semitone unit." Is Mr. Sully really prepared to maintain that a vocalist, when singing the passage C E G C', has present to the ear the facts that the first interval contains four, the second three, and the last five semitones? If he does, he will, we suspect, find few singers prepared to back him up.

The last of the three musical essays appears to us decidedly less good than the other two. On such a subject as the "Nature and Limits of Expression," it would not, indeed, be reasonable to demand of Mr. Sully the objective certainty which Helmholtz's discoveries lent to the first, and the precision of statement which the definitely established principles of the doctrine of form contributed to the second essay. Accuracy in stating the views of other writers may, however, be fairly required, and this test Mr. Sully does not always satisfy. Thus he speaks of

"the courageous assertion of Hanslick, that while the art [music] is wholly unable to represent feeling—since every emotion rests on definite ideas and judgments—it is able to symbolize, by the analogy of audible figure, made up of the height, strength, rapidity, and rhythm of sequent tones, the visible movements of external nature."

These words certainly convey a different view from that of Hanslick, who holds that music can represent *neither* definite feelings, such as love, hatred, or jealousy, *nor* definite movements of nature, but only excite in the mind certain emotional moods vaguely corresponding to such feelings or such external movements. Mr. Sully has later in the same essay himself enforced this very position, but we are at a loss to see how he can find it in the sentence above quoted. A similar tendency to carelessness of statement appears in his applying Beethoven's words, "Fate is knocking at the Gate," to "the grand torrent of sound in the first movement of his C minor Symphony," instead of, as the composer manifestly intended, to the recurring group of four notes, with which it opens. Further, a needless difficulty is caused by the employment of a technical term to which established usage has attached a definite meaning in a different and quite unusual sense. The adjective "tonic," in musical treatises, always stands for "belonging to the key-note." Mr. Sully very frequently uses it as the equivalent of "belonging to a tone." The advantages to be derived from this innovation by no means compensate for the confusion to which, at least in the mind of beginners, it is likely to give rise. We cannot but think, too, that Mr. Sully would have conciliated his readers by studying greater terseness and simplicity of style. He abounds in redundant and ambitious phraseology which sometimes scarcely conveys any intelligible idea. For instance, what is to be made of the following?—

"Music reveals her tenuous shapes to quiet reflection through the medium of memory."

The adjective "melodic," not in itself, one would think, particularly attractive, is employed by Mr. Sully with really irritating frequency—twelve times in a single page of thirty-seven lines, eighty times in a chapter of thirty-four pages; and certain phrases, e.g., "harmonic and melodic sequence" appear over and over again with an iteration calculated to exasperate the most placid reader. In spite of these superficial blemishes, there is in this essay much of imaginative thought and graceful play of fancy which cannot fail to attract and gratify genuine lovers of music.

We have left ourselves no space to speak of the essay on "Lessing's Hamburg Dramaturgy," which introduces its readers to a neglected and almost unknown nook of German literary history; or of that on "The Possibility of a Science of Aesthetics," which certainly leaves behind a conviction of its impossibility in the existing condition of our knowledge.

In conclusion, we beg to thank Mr. Sully for a meritorious and successful attempt to popularise valuable and not very tractable departments of science. SEDLEY TAYLOR.

Essays, Philological and Critical. Selected from the Papers of James Hadley, LL.D., Professor of Greek in Yale College, &c. (London: Macmillan & Co., 1873.)

It is a sad reflexion that amid the bulky literature of English Philology, the first volume which bears Professor Hadley's name should be a posthumous collection of short

papers—of mere fragments, as they may be called, in comparison with what such a man might have produced. The word "fragments," however, is improper; not merely because they are, as essays, of the highest quality, but because they are all thought out with the utmost care and completeness. They are the hewn stones of a building, or of many buildings, destined to be for ever unfinished.

The first paper, "The Ionian Migration," belongs to the historical side of Philology. It discusses a well-known theory of Professor E. Curtius—well-known, at least, in its outlines, as given in his *History of Greece*, but of which the grounds must be sought in brochures and articles not within the reach of most English readers. Professor Hadley gives an excellent summary and criticism of the controversy, hitting the mean, which German writers so seldom attain, between dogmatic statements of results on the one hand, and bewildering *minutiae* on the other. The task was peculiarly difficult. Any one who has read the essay in which Professor Curtius originally published his view—*Die Ionier vor der Ionischen Wanderung*—must have found that he had either to take a great many facts upon trust, or to verify them through a number of more or less inaccessible books. Professor Hadley has brought to the subject a width of knowledge and a soundness of judgment which marvellously smoothes the way through this intricate question.

His parting warning is especially to be commended to students of early history: "It seems highly important that these conclusions should not be invested with more of certainty than properly belongs to them—that they should be recognised as historic speculations rather than historic verities, as probabilities or possibilities rather than facts." Such speculations, in short, are a kind of embroidery of history. They do not build any solid structure on the facts, but they bring these facts into a new and striking relief; and when a set of speculations has done this work for one generation, it is brushed away, and the solid part of the fabric remains.

The other papers on Greek subjects deal mainly with the language, some of them on the philological, others on the purely linguistic side. In the former class may be reckoned the papers on "Greek Rhythm," "Greek Accent," and "Greek Pronunciation." Of these, the essay on "Greek Accent" is the most original. It first appeared in the Transactions of the American Philological Association for 1869, and its value may be understood from the fact that it was reproduced in German three years afterwards in Curtius' *Studien*.

The short paper on Greek pronunciation is of much interest. It is founded on a curious fragment to be found in the Bodleian Library—a MS. containing some pages of the Septuagint transliterated in Anglo-Saxon letters, and probably of the tenth century. The result is that the pronunciation of that time was by no means the same as that which prevails now, although it was quickly approaching to it. For instance, *α* and *υ*, though sounded alike, were distinct from *ι*, and *η* was distinct from both; *αυ*

and *ευ* were still diphthongs, not *af* and *ef*, as in modern Greek: *υτ* and *μτ* were *ut*, *mp*, not *ul*, *mb*. These indications are the more valuable because the Greeks have preferred a traditional to a phonetic spelling, and have thus obscured almost hopelessly the natural changes through which their language has passed. Professor Hadley, in more than one place, enters a strong protest against the common fallacy of regarding a traditional spelling as favourable to philology. In fact, every point in which spelling represents anything but living pronunciation, is the loss of so much evidence for the history of the language. Where would be our knowledge of the Greek dialects if a uniform system of spelling had prevailed in the classical period? And, as Professor Hadley asks, what would we not give for a *Phonetic Nuz* of the age of Chaucer?

In the review of "Bekker's Digammated Homer," Professor Hadley anticipates much that has since been done in Germany. As a single example may be mentioned the distinction between *ἐπών* (*Fepōw*), to draw, and *ἐπόμαι*, to shelter, which is maintained by Curtius in a recent volume of his *Studien*. In some points, as in the analysis of *ἐούκα*, *ἔμα*, and *ἐρχαται*, he seems to us to be in advance of most etymologists.

Certain of the essays in comparative philology—viz. those on "The Root *prach* in Greek," on "Indo-European Aspirate Mutes," on "The Formation of Indo-European Futures," on "Passive Formations"—are offered by Professor Whitney with an apology, as works which their author might not himself have chosen to publish. They do not contain so much original matter as some others; but as popular expositions, bringing together illustrations of some one subject, or questions in the science of language, they could hardly be excelled. Had any been omitted, we should more easily have dispensed with one or two reviews, especially of Ross on "Italians and Greeks," or Mr. Manning on "The Origin of the English Possessive Case." It may be inevitable, but it is none the less matter of regret, when men like Professor Hadley are obliged to compose careful refutations of books which they and all well-informed students see at a glance to be worthless.

The two papers on English—a review of Ellis's *Early English Pronunciation*, and an essay on "English Vowel Quantity in the Thirteenth Century and in the Nineteenth"—deserve a separate notice; the latter is a model of research, and is not only an important contribution to the history of English, but throws a great deal of light on the various influences which tell upon the vowel-quantity of language in general. The loss of consonants, for instance—has often had the effect of producing what is known in German as *ersatzdehnung*, "compensatory lengthening" of a preceding vowel. The mode in which this takes place may be understood from such instances as the word *light*, German *licht*, or *folk*, *alms*, for *fōlk*, *āl-mes*. The rationale of the process is thus given by Professor Hadley:—

"In every instance of the kind there must have been a time of transition, when the consonant was beginning to be omitted, when the very speakers who omitted it were

perfectly aware of its existence, and perhaps generally pronounced it, but occasionally let it drop, with a lengthening of the preceding vowel. Now, this consciousness of a consonant with a claim to be pronounced is an important element in the phenomenon. The speaker who does not really pronounce it does not feel that he can omit it altogether; he does not feel that he is altogether omitting it. To his own feeling he gives it a kind of recognition. He perhaps brings the organs of speech into some sort of approach toward the position required for pronouncing the consonant, so that the preceding vowel passes into a sound more or less modified, which does duty for the consonant. If this modification continues to be made, then the resulting long vowel-sound will not be a mere simple prolongation of the preceding short, but something different, perhaps a diphthong. Yet it may very well happen that, in this quasi-pronunciation of the consonant, the approach made by the organs to the position for that consonant will grow more and more slight, and the sound produced will differ less and less from a mere continuation of the preceding vowel; until finally, and perhaps very soon, it comes to be just that and nothing else; and the consonant is replaced, as its claim for utterance is felt to be satisfied, by a simple addition of quantity to the preceding vowel."

In forming an estimate of the powers and usefulness of such a man, readers should notice especially the "Decisions of College Class Disputes." They will see in them what excellent work is thrown by a teacher like Professor Hadley into the daily task of guiding the thoughts and efforts of his pupils. Some of the political remarks—for instance, those on Germany in the paper headed "Napoleon and European Liberty"—read like prophecies. The criticism of Demosthenes introduced in a comparison of ancient and modern eloquence is admirably just. Everywhere, in short, we find the evidence of a refined as well as a genial and powerful mind.

D. B. MONRO.

SOME SCIENTIFIC BOOKS.

Geology. By Archibald Geikie, LL.D., F.R.S., Director of the Geological Survey of Scotland. Illustrated. (London: Macmillan & Co., 1874.) This is the fourth volume of Messrs. Macmillan's Science Primers which has appeared, the Introductory Primer, by Professor Huxley, being still in preparation. The little books are intended for elementary schools, and are written in an easy familiar style. The illustrations and examples are also drawn from common sources. The work is quite elementary, as it should be; and will suffice to teach the student a good collection of fundamental facts in connection with geology, and to stimulate him to further inquiries.

Animal Physiology: the Structure and Functions of the Human Body. By John Cleland, M.D., F.R.S., Professor of Anatomy and Physiology in Queen's College, Galway. 325 pages. (London and Glasgow: Wm. Collins & Sons, 1874.) Not long ago the study of physiology was confined to the medical student, but with an extended system of instruction in science, it is now taught in many of our schools, and receives more attention at the Universities than ever before. The work before us will be found useful both in schools and universities, and as an introductory text-book for the use of medical students at the commencement of their hospital career. While to some

extent it discusses popular physiology, it at the same time enters more fully into the subject than the mere amateur would desire. The work is clearly written, and is beautifully illustrated by highly magnified original designs. We would specially call attention to such illustrations as Fig. 101 (the grey matter of the convolutions); Fig. 132 (the organ of Corti); and Fig. 38 (sweat glands and Pacinian corpuscles). It is divided into sixteen chapters, which treat of the skeleton, muscles, epithelium; the blood, circulation, respiration, and absorption; the nervous system and the senses. The chapters on the brain and spinal cord are extremely interesting and lucid, and embody the most recent developments. The work appears to have been written with a special view to the requirements of the Advanced Course of the Directory of the Science and Art Department, but it will no doubt be found useful for other purposes.

Physical Geography. By John Young, M.D., F.R.S.E., Regius Professor of Natural History in the University of Glasgow. 386 pages. (London and Glasgow: Wm. Collins & Sons, 1874.) The prizes which are yearly offered for competition by the Royal Geographical Society have done much to stimulate the study of physical geography during the last few years. It is noticeable, also, that papers on the subject form a part of many of the competitive examinations which are still increasing in every department of the State. The arrangement of Mr. Young's book is good, and the style is clear and suggestive. He has given great prominence to the geological influences, which bear upon physical geography more or less directly. We could have wished to find more information about the earth as a member of the solar system, at the commencement of the book. Also a fuller explanation of the cause of the change of seasons, and diagrams to illustrate the positions of the earth in relation to the sun at different times of the year. The work is almost without illustration, and has suffered considerably from the omission, for surely if a treatise on one of the experimental sciences requires illustration, much more does a treatise upon observational science. We should be glad to see this remedied in the second edition. Otherwise the book is very readable and interesting, and will be found serviceable in schools, although we do not notice that it possesses any very special and original features.

The Unity of Natural Phenomena. A Popular Introduction to the Study of the Forces of Nature. From the French of M. Emile Saigey. (Boston: Estes & Lauriat, 1873.) This is a kind of essay of somewhat the same nature as Mr. Justice Grove's *Correlation of the Physical Forces*. It gives a résumé of the most important recent discoveries in various branches of science, and shows how they tend to unite the apparently most diverse branches of knowledge. To rightly understand the work, a certain knowledge of the physical sciences is necessary. It is scarcely correct to call the book *Science for the People*, who must be clever people indeed if they can understand about the electric unit and its mechanical equivalent, and the cosines of solar latitudes, without previous instruction. To the fairly well-informed scientific reader the book will prove interesting and instructive.

Half-hours with the Microscope. By Edwin Lankester, M.D. Illustrated. **The Preparation and Mounting of Microscopic Objects.** By Thomas Davies. (Robert Hardwicke, 192 Piccadilly.)—Dr. Lankester is well-known as a writer on microscopy. He has given, in the little volume before us, a popular account of the microscopic examination of a large number of interesting objects, and the book will be found to be a very suitable companion to all who possess a microscope and time to use it. Mr. Davies' book appeals to a much smaller class of readers, as it is of necessity more technical. Many people who possess a microscope have neither the knowledge nor the patience and skill which

the mounting of microscopic objects requires. A careful study of Mr. Davies' book will enable them to mount their own objects.

Darwinism and Design, or Creation by Evolution. By George St. Clair. (London: Hodder and Stoughton, 1873.) This work is one of a class which hitherto has received but little support. We have on the one side the theological school of thought, which in the main ignores the recent revelations of science and Darwinism altogether; on the other hand we have the growing ranks of science, which include men of very varied theological views, from the absolute nihilist to those who endeavour to prove that each new result of science is a new proof of omnipotent design. The object of Mr. St. Clair is to reconcile science with religion; to show that Darwinism and Atheism are by no manner of means synonymous; "that if evolution be true all is not lost, but on the contrary something is gained; the design argument remains unshaken, and the wisdom and beneficence of God receive new illustration." We recommend his book to all those who have followed the apparently conflicting arguments of the two schools.

G. F. RODWELL.

NOTES AND NEWS.

OF the various schemes which have been proposed for facilitating communication with the continent, perhaps the most feasible is that of constructing a submarine railway tunnel between England and France. Should any attempt be made to construct such a tunnel, the engineer will doubtless derive much aid from the geologist. Few geologists are entitled to speak with more authority on a subject of this character than is Mr. Prestwich; special interest therefore attaches to a paper recently published in the Proceedings of the Institute of Civil Engineers, in which he discusses the geological conditions affecting the construction of the projected tunnel. In this paper the author describes in succession the several geological formations in the south-east of England and the north-west of France, giving prominence to those strata which, by their impermeability, would probably offer security against any irruption of the Channel waters. The London clay forms a thick deposit of tenacious and impervious material, which presents favourable conditions for submarine tunnelling. But as the nearest points on the two coasts where the London clay is largely developed are about eighty miles apart, it is estimated that the tunnel, including the approaches, could not be much less than a hundred miles in length. A tunnel in the London clay would, therefore, offer immense difficulty to the engineer. Dismissing the Lower Tertiaries, beneath the London clay, as unsuitable for tunnel work, Mr. Prestwich passes to the chalk. Whilst the upper beds are soft and porous, the lower chalk, or chalk marl, is in some parts sufficiently argillaceous and compact to be comparatively impermeable; nevertheless the author believes that the possible occurrence of fissures would render it an untrustworthy medium over a large area. Below the chalk comes the Upper Greensand, which is too thin a deposit to merit notice; then follows the Gault, a very tenacious and impermeable clay, but scarcely thick enough for the purposes of the tunnel; this is succeeded by the several members of the Lower Greensand, all unsuitable for engineering work on a large scale; next come the Wealden beds, which, though well developed in England, thin out near Boulogne; these are followed by the permeable Portland beds, by the thick deposit of Kimeridge clay, associated, however, with subordinate bands of less permeable material; and, finally, by the Oxford clay, and other members of the Jurassic series. On the whole, the author believes that the secondary strata are too irregular in their range and too much broken up by faults, to admit of being safely tunnelled.

Now comes the original part of Mr. Prestwich's communication. Of late years the opinion has been

growing among geologists that a floor of palaeozoic rocks underlies the south-east of England and the north-west of France, and that these rocks, which hold their range quite independently of the superincumbent secondary and tertiary strata, may in certain localities be brought within a moderate depth from the surface. The main axis of the palaeozoic rocks, after exposure in the Boulonnais, plunges beneath the Channel, and it seems likely that the crest of this underground ridge would be found in the neighbourhood of Folkestone. These palaeozoic rocks are for the most part compact and water-tight, and where protected by impermeable overlying strata might be safely tunneled through. Mindful of these advantages, Mr. Prestwich is bold enough to suggest that the Channel tunnel might actually be carried through these ancient rocks. The geologist having thrown out this hint for a solution of the problem, it remains for the engineer to determine whether he is competent or not to grapple with the difficulties which it presents—difficulties which even the most ardent geologist must admit are neither few nor small.

A REMARKABLE discovery of the bones of pleistocene mammals, in considerable quantity, has recently been made near Castleton, in the Peak of Derbyshire. From Mr. J. Plant's description, published in the last part of the Transactions of the Manchester Geological Society, we learn that the bones were found in Windy Knoll Quarry, on the south-west flank of the well-known Mam Tor, and that they occurred in association with angular fragments of limestone, embedded in loam and calcareous sinter, which occupied a fissure in the Mountain Limestone near its junction with the Yoredale shales. The remains have been submitted to Mr. W. Boyd Dawkins for determination. The published catalogue of these mammals includes the aurochs (*Bison priscus*), the cave-bear (*Ursus spelæus*), the wolf (*Canis vulpes*), the reindeer (*Cervus tarandus*), and the roe-deer (*C. capreolus*).

IN the last number of *Silliman's American Journal*, Professor O. C. Marsh, of Yale College, continues his notices of New Tertiary Mammals from America. Among the fossils described in this paper are several Edentata. Under the name of *Morotherium* he describes a new genus which appears to be most nearly related to *Megalonix* and *Myloodon*. One species, called *Morotherium gigas*, was found in the Pliocene strata of Central California; whilst a smaller species, named *M. leptonyx*, occurs in the Pliocene beds of Idaho. Another new genus, of considerable interest, was discovered last year by Professor Marsh in the Upper Eocene deposits of Wyoming, and has been called *Stylinodon*.

"EIN Beitrag zur Kenntniss fossiler Eganoiden" is the title of a paper communicated to the German Geological Society, by Herr K. Martin, of Göttingen. This paper contains some interesting observations made in studying the ganoid fish in the palaeontological collections of the Göttingen Museum. The author appears to have carefully worked out the osteology of the head of *Palæoniscus*, and has given a restoration of the skull in this genus and in *Amblypterus*.

It appears that the fine collection of local fossils in the Bristol Museum is being turned to good scientific account by the active curator, Mr. E. B. Tawney. The Bristol Naturalists' Society has recently issued the first part of a new series of its Proceedings, and Mr. Tawney has contributed to this number a valuable paper on the Dundry Gasteropoda represented in the Museum. Dundry Hill, near Bristol, rising to a height of 700 feet above the sea-level, is formed chiefly of Lias, capped by beds of the Inferior Oolite. This hill was described in 1859 by Mr. Etheridge, but his list of Inferior Oolite fossils has since been considerably increased. Mr. Tawney's studies show that sixty-six species of gasteropoda occur in these beds; the genus *Pleurotomaria* alone numbering

no fewer than twenty-six species. The paper contains descriptions of several new species, and is illustrated by a couple of excellent lithographic plates.

PURSuing his studies of the Devonian rocks of Rhenish Prussia, Herr E. Kayser has submitted to the German Geological Society a memoir on the fauna of the limestone of the Enkeberg, and that of the slates of Nehden, near Brilon, in Westphalia. The paper contains detailed descriptions of some of the most characteristic Upper Devonian Cephalopods, chiefly referable to the genera *Goniatites* and *Clymenia*.

THE last part of the *Zeitschrift der Deutschen Geologischen Gesellschaft* opens with a paper by Dr. O. Feistmantel, of Breslau, on the Gas-shales of Nürschan, in which he discusses their geological position and characteristic fossils. The stratigraphical relations of these shales had been previously disputed, but the author refers them to the Lower Rothliegende. They contain Permian fish, such as *Acanthodes gracilis*, F. Roem., and *Xenacanthus Decheni*, Beyr. The flora, however, presents a carboniferous facies, thus tending to confirm what other observers have remarked, that the carboniferous flora passes up into the overlying Permian rocks.

DR. FEISTMANTEL has recently published another paper, in which he describes some new species of *Equisetum* (*Equisetites*), or fossil horse-tails, from the coal measures. In the last number of Leonhard and Geinitz's *Jahrbuch für Mineralogie, u.s.c.*, he describes and figures a large stem found near Breslau, and named *E. Schützianum*, in compliment to Bergmeister Schütze. Another species, from Upper Silesia, has received the name of *E. tenuidentatum*.

A MOURNFUL interest clings to the opening paper in the current number of Leonhard and Geinitz's *Jahrbuch*, as being the last communication from the pen of the late Professor Naumann. The MS. was left unfinished, and has been completed by his son, Dr. Ernst Naumann, of Jena. In this paper the great geologist describes the Hohenburg Mountains—a group of porphyry hills on the right bank of the Mulde, in Saxony—and discusses the probable origin of certain smooth faces which these rocks present.

AMONG the miscellaneous matter in the last number of the *Zeitschrift* of the German Geological Society, we may call attention to Professor Rammelsberg's obituary notice of Gustav Rose, of Berlin. The same number contains the proceedings at the twenty-first general meeting of the society, held last autumn at Wiesbaden.

M. LEYMERIE has communicated to the French Academy of Sciences a note on the age and position of the marble of Saint-Béat, in the department of the Haute-Garonne. This marble is sufficiently fine in texture to be worked for the use of the sculptor. It forms part of a great zone of marbles on the French side of the Pyrenees. This zone is divided into two parts: on the eastern side the marbles are associated with rocks containing oolitic and cretaceous fossils; whilst on the western side they are of much earlier date, some being referable to the Carboniferous period, and others to a much older phase of the earth's history.

MR. JOSEPH PRESTWICH, F.R.S., has been appointed Professor of Geology in the University of Oxford, in succession to the late Professor Phillips. Mr. Prestwich has for many years been engaged in original investigations relating specially to the Tertiary and Quaternary formations. He has also given much attention to the bearing of geology upon such important questions as the water supply of the metropolis, and the probable extension of the coal-measures beneath newer rocks. In 1849 Mr. Prestwich received the Geological Society's Wollaston medal, and in 1870 he

succeeded Professor Huxley as President of the society.

PROFESSOR HELMHOLTZ has given an account to Professor Binz, of Bonn, of his curing hay-fever, from which he is an annual sufferer, by throwing a weak solution of quinine up his nostrils (one part to 800 of water). This destroys certain minute vibriones which appear in the nasal secretions, and which if not the cause of the complaint, appear to aggravate it. Professor Helmholtz has used quinine in this way since 1863, but he has hesitated to make it known as a remedy, as it did not succeed in some other cases. He finds it stop the violent sneezings produced by the disorder, and which return if its application is omitted.

M. HENRI PARVILLE (in the *Débats*) describes a method by which M. Susani hatches silk-moths' eggs at pleasure. It consists in brushing them with dogs'-tooth grass (*chien-dent*), which he prefers to hair. The eggs should be laid on paper by the moths, and brushed for ten minutes when the hatching is required. A batch thus treated on August 1 hatched out on the 14th. About a tenth are lost in the process.

M. HENRI PARVILLE likewise gives an account of some very interesting experiments on the diffusion of gases, by M. Dufour, of Lausanne. Instead of taking gases of two densities, he operates with one in two states, dry and moist, and finds they behave as if their densities differed, in the rapidity with which they traverse porous earthenware. If, for example, a porous cylinder of earthenware, such as is used in voltaic batteries, is closed at the top by a perforated cork, through which passes a second tube, acting as a pressure gauge, and has in its interior some sulphuric acid or calcic chloride to absorb the moisture from its air, and is then placed in a damp atmosphere, it will be found that the internal pressure decreases through the passage of the dried air through its walls, at a quicker rate than the moist air can get in. It is obvious that these facts may throw light upon the processes in living plants, and perhaps also on some meteorological phenomena.

Justus Liebig's Annalen der Chemie und Pharmacie, Band 172, Heft 2.—Chemistry has of late years made wonderful progress in dealing, both by synthesis and analysis, with complex bodies; and every day adds to the number of new compounds, or new modes of forming old ones, by processes more or less analogous to those by which what are called organic substances are produced in living beings. The new discoveries frequently conduct to objects of practical utility, such as furnishing new dyes to the manufacturer, or fresh medicines to the physician; but to the philosopher they have a higher use, in contributing towards a solution of the physical problems relating to life, organisation, evolution, etc.; and, though able thinkers like Dr. E. J. Mills may lament the slow progress of chemical theory, and point to the unsatisfactory character of many of the prevailing hypotheses, it is evident that chemists are advancing towards the recognition of some great principles which will give unity and intelligibility to what are now terrible swarms of scattered facts. These expressions are suggested by a glance at the serial before us. We see nothing in it that can be made interesting to any but those actually engaged in the special studies to which each paper refers, and yet the various matters are all important. Some remarks relate to the uric acid group, others to the oxidation-products of resins and turpentine, and others to bodies with names that would convey no general information even to chemists working in other directions.

Chemical nomenclature is fast becoming intolerable; and though we may sympathise with the object for which such names as "Dicarboxyl-sulfocarbonylid" or "Eisenoxydalanhydrosulphat" are constructed, we cannot resist the conviction that a science with such an alarming

nomenclature is in a transition state, from which we hope, for the comfort of its votaries, it may soon emerge. One of the most elaborate papers in this number relates to Piperin and its Compounds.

AMONG the novelties shown at the recent International Agricultural Exhibition at Bremen, is a straw-roof sewing machine, which, according to the local reports of its efficiency, can turn out of hand from 1,500 to 2,000 square feet of watertight roofing in an hour, requiring only two human assistants to accomplish its task. We are glad to learn that this ingenious machine, which has excited great attention at Bremen, was made by an English firm, being the invention of the Essex machinists, Messrs. Gooday. The exhibition appears on the whole to be particularly well supplied with inventions which must be characterised as ingenious, even where they do not seem to hold out much hope of their practical utility; and amongst other curious novelties mention is made of a carriage-propeller, named by its inventor, Herr Fehrmann, of Potsdam, "Horse-Sparer." This humane apparatus, which carried off one of the fifteen gold medals awarded by the association, was put to a practical test in the presence of large numbers of wondering spectators, and is reported to have acquitted itself very successfully.

PROFESSOR COHNHEIM, of Breslau, the distinguished pupil of Virchow, has been called to the chair of Pathological Anatomy at the University of Vienna, vacated by the retirement of the veteran Rokitsansky. Professor Cohnheim has earned for himself a more than ordinary reputation in the medical world by his work on the *Origin and Course of Inflammatory Lesions*, while his efficient services in the military hospitals at Kreuzberg during the recent Gallo-German war have secured for him the gratitude and esteem of a large section of his non-professional brethren.

We learn from the German papers that Dr. Schweinfurth, to whom the Geographical Society has this year awarded its gold medal, has presented to the Zoological Garden at Berlin several specimens of the *Megalotis* (Arabic *Fennek*), which has long been a desideratum in European collections, and has never yet been reared in any of our zoological institutions.

THE preparations for the expedition which is to proceed, at the cost and on behalf of the German Imperial Government, to observe the transit of Venus from the Kerguelen Islands, are now completed; and the members of the scientific staff, under the direction of Dr. Weineke, have joined the corvette *Gazelle* at Kiel. The greater part of the physical and mathematical instruments have been made at Schwerin under the superintendence of the mechanist, Herr Kulle, who is to accompany the expedition, which will be attended by a photographer and numerous scientific assistants. It is proposed that the entire staff of observers shall return by way of the Suez Canal, while the *Gazelle* proceeds on her mission of cruising two years in the Indian Ocean to make further observations.

THE reading public has no reason to complain of any want of guides to the new and various discoveries which are continually being brought to light from the Assyrian inscriptions. Indeed the literature upon this subject pours in so rapidly from England, France, and Germany, that it is difficult to keep pace with it. One of the latest works to which we would direct the attention of our readers is by Dr. Schrader on *Die Höllenfahrt der Istar: ein Altbabylonisches Epos* (Giessen, 1874), which is of value and interest both for the scholar and for the literary world generally. An analytical translation, with notes philological and exegetical, is given of a curious Chaldean legend, which describes how the goddess Istar descended through the seven gates of Hades, losing at each some portion of her apparel, and was imprisoned in the gloomy realm of the dead until the gods, missing the Goddess of Love, created a phantom

sphinx which brought back the luckless divinity from her place of confinement. The myth formed part of the great Babylonian epic which revolved round the adventures of a solar hero, and gave its name to the sign of the Zodiac which we still call Virgo. Whether the legend proves that the Semites possessed an epic of their own, as Dr. Schrader thinks, may be questioned: the whole circle of stories, as well as their framework, go back to an Accadian original. To this *Descent of Istar* the author has appended translations of parts of the Assyrian renderings of Accadian religious hymns and lyrical pieces, and notices the striking resemblances in ideas and expressions between them and the Hebrew Psalms. One of them breathes quite a modern spirit: "Lord, my transgressions are many: great are my sins! The Lord in the fierceness of his heart: has heaped vengeance upon me! God in the strength of His heart: has overpowered me!" All the hymns given by Dr. Schrader belong to the pre-Semitic population of Chaldaea, and are of remotely ancient date, with the exception of the first, which is of Assyrian origin. Dr. Schrader has added a glossary, and the book increases our grammatical and lexical knowledge of Assyrian.

THE University of Berlin has experienced a heavy loss in the death of the distinguished Orientalist, Professor Emil Roediger, well known for his eminent services in the domain of Semitic philology and scriptural criticism. Professor Roediger was born at Sangerhausen in 1801, and in the year 1861 he migrated from Halle to Berlin, where he entered upon the duties of the chair once filled by the great scholar Friedrich Rückert, but which had remained vacant long after his death.

MEETINGS OF SOCIETIES.

LINNEAN SOCIETY (Friday, June 19).

G. J. ALLMAN, M.D., President, in the Chair. E. Birchall, Esq., James Leatham, M.D., and J. Harbord Lewis, Esq., were elected Fellows. Mr. D. Hanbury, Treas. L.S., exhibited branches of olive grown in the open air at Clapham, some bearing flowers, others, nearly ripe fruit; also a specimen of *Rheum officinale*, Baill., now grown in this country for the first time, the source of the true medicinal Turkey rhubarb, and pointed out the characters in which it differs from other species of the genus. Dr. Hooker made a communication on the subject of some India *Garcinias* to the effect—(1) That the *G. indica*, Choisy. (*purpurea*, Roxb.), had been placed in a wrong section in Anderson's review of the genus in the *Flora of British India*. (2) That the plant described in the same work as *G. Griffithii* is proved to be the true gamboge plant of Siam, *G. pinella*, var. *pedicellata*, of Hanley, which Dr. Hooker regards as a distinct species, and proposes that the name of *G. Hanburyi* should be given to it. (3) That the *G. brevirostris* of Scheffer is identical with *G. eugeniaefolia* of Wallich. (4) That the name of *G. ovalifolia*, Hook. f., must give place to the previously published *G. ovalifolia* of Oliver's *Flora of Tropical Africa*; and the Indian plant must take the name of *spicata*, it being a form of *Xanthochymus spicatus*, W. and A. Professor Thesleton Dyer exhibited a young oak-plant with three cotyledons, which had been sent to him by Mr. Cross, of Chester; also a pitcher-like development of a leaf of the common cabbage, from Harting, Sussex, sent by Mr. H. C. Watson to the Kew Museum. Mr. A. W. Bennett exhibited drawings of the style, stigma, and pollen-grain of *Pringlea antiscorbutica*, Hook. f., describing the remarkable manner in which the pollen of *Pringlea* differs from that of other nearly allied Crucifers, being much smaller and perfectly spherical, instead of elliptical with three furrows. This he considered a striking confirmation of Dr. Hooker's suggestion that we have here a wind-fertilised species of a family ordinarily self-fertilised, a hypothesis which is again confirmed by a total

absence of hairs on the style of *Pringlea*. An extract was read of a letter from Harry Bolus, Esq., F.L.S., to Dr. Hooker, dated Graaft Reinets, April 4, 1874, in which he comments adversely on some of the reasonings contained in Grisebach's *Vegetation der Erde* in favour of the theory of "independent centres of creation." Grisebach, relying chiefly on an observation of Burchell's, makes the Orange River the boundary between the Cape and Kalahari provinces, a boundary which Mr. Bolus shows to be untenable, at least in certain portions. Grisebach unites the Kanoo flora with that of the Cape province; while Mr. Bolus doubts whether it does not differ more from this than from the Kalahari. The Roggeveld, and indeed the whole Kanoo, by its predominance of shrubby Compositae, seems to incline more to the desert type of plants than to the richer Cape flora. The following papers were then read—viz.: 1. "On the Resemblances between the Bones of Typical Living Reptiles and the Bones of other Animals." By Harry G. Seeley, Esq., F.L.S. 2. "On the Auxemmeae, a new tribe of Cordiaceae." By J. Miers, Esq., V.P.L.S. 3. "A Revision of the Suborder Mimoseae." By G. Bentham, Esq., LL.D., V.P.L.S. 4. "On some Fungi collected by Dr. S. Kurz in Yomah, Pegu." By F. Currey, Esq., Sec. L.S. 5. "Notes on the Letters from Danish and Norwegian Naturalists contained in the Linnean Correspondence." By Professor J. C. Schiödt, of Copenhagen.

NEW SHAKSPERE SOCIETY (Friday, June 26).

THE subject of the paper read was "Two Plays of Shakspeare's, the versions of which as we have them are the results of alterations by other hands, viz., *Macbeth* and *Julius Caesar*." In the absence of the writer (Mr. Fleay, of Skipton, Yorkshire), the paper was read by Mr. Matthew. With regard to *Macbeth*, it began by stating the views of the Cambridge editors; and with these, so far as they go, it mainly agreed; but it went far beyond them, and threw doubts on several passages never hitherto suspected. The evidence chiefly relied upon was the internal one of style. As to *Julius Caesar*, the theory propounded was that that play, as we have it, is, in fact, a revision of Shakspeare's play made by Ben Jonson. In the discussion that followed, the views set forth by Mr. Fleay met with little favour. Mr. Furnivall pointed out at some length several palpable mistakes, and several quite unauthorised statements made by Mr. Fleay. Mr. Matthew showed that Mr. Fleay's confident declaration as to Shakspeare's use of verse and prose in "mixed scenes" was not supported by facts. Mr. Hales, after some general remarks on certain peculiarities of *Macbeth*, and expressing his inclination to agree with the Cambridge editors as to the Hecate speeches, further illustrated the extremely dubious character of both Mr. Fleay's assertions and his arguments.

STATISTICAL SOCIETY (Tuesday, June 30).

AT the fortieth anniversary meeting of this Society, the following Fellows were elected as President, Council, and Officers for the year ensuing: President, William Augustus Guy, M.B., F.R.S. Council: The Right Hon. the Earl of Airlie, Kt.; Sir James Anderson, F.R.G.S.; General Sir George Balfour, M.P.; Henry G. Bohn, F.R.A.S., F.L.S.; Thomas Brassey, M.P.; Samuel Brown, F.I.A.; Edwin Chadwick, C.B.; Hammond Chubb, B.A.; Hyde Clarke, D.C.L.; Leonard Henry Courtney; Francis Galton, F.R.S.; Robert Giffen; F. H. Janson, F.L.S.; Henry Jeula, F.R.G.S.; James Thomas Hammick; Frederick Hendriks; James Heywood, M.A., F.R.S.; Francis Jourdan; H. Reader Lack; Professor Leone Levi; William Golden Lumley, Q.C., LL.M.; R. Biddulph Martin, M.A.; Frederick John Mouat, M.D.; R. H. Patterson; Frederick Purdy; Ernest Seyd; Thomas Sopwith,

M.A., F.R.S.; The Right Hon. the Earl Stanhope, F.R.S.; General Richard Strachey, R.E., F.R.S.; William Tayler, Treasurer, James Thomas (Hannick), Secretaries: Frederic J. Mouat, M.D.; Robert Giffen; II. Reader Lack, Foreign Secretary, Frederic J. Mouat, M.D.

FINE ART.

RECENT CONTRIBUTIONS TO DÜRER LITERATURE.

Die Personen-Namen in Albrecht Dürer's Briefen aus Venedig. Von Georg Wolfgang Karl Lochner. (Nürnberg, 1870.)
Dürer's Briefe, Tagebücher und Reime übersetzt und mit Einleitung, Anmerkungen, Personenverzeichnis und einer Reisekarte versehen. Von Moritz Thausing. (Wien, 1872.)

CONSIDERING the length of time that the Dürer-mine, as it may be called, has been worked, and the immense number of workers that there have been in it, it is surprising to find that it is still capable of yielding fresh material. Yet such is the case. Since Dr. von Eye published the second edition of his *Leben und Wirken Albrecht Dürer's*, in 1869, and since Mr. Scott's work and the present writer's appeared in England on the subject, several new shafts have been let into this mine, and two or three new facts dug out.

Before examining these, however, it will be as well to pass in review the older writers upon Dürer, and to see what each one has contributed to our stock of knowledge concerning him.

First of the long line of Dürer's biographers stands the patriotic Nürnberger, Johann Neudörfer, for the slight sketch by Camerarius of Dürer's person and character in the preface to his Latin translation of *The Book of Human Proportion*, although most valuable for the testimony it bears to Dürer's physical, mental, and moral excellence, can scarcely be termed a biography. In Neudörfer's quaint little volume of *Nachrichten*,* or short memoirs of his fellow-townsmen, written shortly after Dürer's death, the praise accorded to Dürer is not different in degree from that bestowed upon many others of the "distinguished" artists of Nürnberg whose names are now forgotten, or live only in this little book. Neudörfer, indeed, stood too near to his heroes to be able to measure accurately their relative proportions, and Nürnberg was not at that time aware that Dürer was the greatest of her sons. He himself complains, in a letter to the Rath, that he "never received as much as 500 gulden for work done for his native town."

Vasari, the next writer in point of date to Neudörfer, knew nothing of the Nürnberger's *Nachrichten*, but wrote a totally independent sketch. Vasari's knowledge of his subject was not very accurate. He describes Dürer chiefly as an engraver, merely mentioning that he likewise "executed paintings on canvas, wood, or other substances, which are all excellent works." He did not even know that he was a German, but credits Antwerp with the production both of Dürer and Martin Schongauer.

The Dutch Vasari, Karl van Mander, who published his great *Schilder Boeck* in 1604,

was the first to give any satisfactory account of Dürer's paintings and drawings, many of which he describes from personal observation. Van Mander had excellent opportunities of acquiring information. He travelled through Italy, Germany, and France in search of materials for his biographies, and was more careful than his Italian predecessor about repeating mere hearsay stories. Later researches have of course brought to light many facts of which he was ignorant, and have proved many of his statements erroneous; still, considering the date at which his *Schilder-boeck* was written, it must be considered a monument of industrious research and accurate information.

It was fortunate that it was so, for as far as regards Dürer undoubtedly, and more or less, I believe, as far as regards all Teutonic artists, Van Mander's work has been the foundation of all subsequent biographies. Even Joachim von Sandrart, in his learned *Teutsche Akademie*, first published in 1675, tells us very little more than Van Mander about Dürer, although he might, considering his excellent opportunities for acquiring knowledge on the subject, have greatly increased his predecessor's stock of facts. His *Teutsche Akademie*, however, with all its pretensions, is not of much more worth than its author's painted works. Like these, it is chiefly a compilation.

Sandrart, the follower of Van Mander, was followed in his turn by Doppelmayr, in his *Historische Nachrichten von den Nürnbergischen Mathematicis und Künstlern* (1730); by Baldinucci in his *Notizie*, by De Piles, D'Argenville, Descamps, and a number of less-known compilers, who, if they ever ventured to add a statement of their own, were sure to make some blunder about it. Melchior Adam drew his picture of Albrecht Dürer, in his *Vita Philosophorum Germanorum*, chiefly from Vasari and Camerarius; and Arend, who in 1728, on the occasion of the 200th anniversary of Dürer's death, wrote a laudatory memoir in his honour, drew upon his imagination for such facts as he did not find in earlier authorities. These, with Johann Hauer, Georg Andreas Will, Gottfried Schober, Heinrich Hüsken, and Knorr, who made imperfect catalogues of Dürer's works, were the chief authorities in Dürer literature until 1779, when Von Murr, in his *Journal zur Kunstgeschichte* (vols. vii. and x.), published for the first time the Letters of Dürer to Pirckheimer, the Journal of the Netherlands Tour, and Dürer's rhymes, *von seinem eignen Concept abgeschrieben*. Von Murr was succeeded by J. F. Roth, who wrote a life of Albrecht Dürer in 1791, and by Dr. Friedrich Campe, who in 1828, when the 300th anniversary of Dürer's death was solemnly celebrated in Nürnberg, published a small gift-book that he called *Reliquien von Albrecht Dürer*, containing the letters, journals, and other writings previously published by Von Murr, with a few additions of no great importance. Both Campe and Von Murr profess to have faithfully copied the original documents, but their rendering of words and the meanings they attach to them often differ.

After the impetus thus given to Dürer literature by the publication of so much interesting matter, it is not surprising to find a

new crop of writers start up. Among these Joseph Heller, of Bamberg, claims precedence, although the exhaustive work that he proposed to himself to accomplish was never finished. Under his name in catalogues, and on the title-page of his second volume, we find written, "Das Leben und die Werke Albrecht Dürer's in drei Bänden;" but the first and third volumes, which were to have contained the life and writings of Dürer, were never written, Heller having died during their preparation. The second volume, however, published 1827 to 1831, is in itself a stupendous work. It consists of descriptive catalogues of all Dürer's drawings, paintings, woodcuts, copper engravings, and plastic works, with their copies, and its extent may be judged by those who have not had the misfortune to study its confused details, by my saying that the second part of it (it is in three parts) contains no less than 2,555 numbers.

After Heller came G. C. Nagler; Dr. Rudolf Marggraff; Moritz Max Mayer; Dürer's Italian biographer, N. Marij; the Dutch translators of the *Tour in the Netherlands*, A. D. Schinkel and F. Verachter (the latter of whom enriched his translation with many elucidatory notes); the French translator Charles Narrey, whose accuracy is not remarkable; B. Hausmann, who made the water-marks of the paper of the prints his especial study; Emile Galichon; Albert von Zahn, who studied Dürer in his relation to the Renaissance; and several other writers, besides innumerable articles in magazines and critical journals.

But notwithstanding this amount of literature on the subject, the work that Heller had begun remained unfinished until 1860, when Dr. von Eye took it up, and gave us for the first time, in his *Leben und Wirken Albrecht Dürer's*, a lucid and succinct history of the life and works of the great German artist. Dr. von Eye's previous labours considerably lightened the tasks of Dürer's English biographers, not by preventing the need of consulting earlier authorities, but by pointing out in what those earlier authorities had erred. In one respect, however, his life of Dürer seemed to me deficient. Instead of giving the letters, journal, &c., in the original, or, as would have been better, translating them into modern German, he merely quoted from them and paraphrased them. This deficiency Mr. Scott and I sought to supply, by translating Von Murr's and Campe's versions. No one but ourselves knows the difficulty of the task. We had not even the benefit of Dr. von Eye's improved and commented edition of the letters from Venice, which was published in the *Jahrbücher für Kunstwissenschaft* immediately after our work was done. This and the second edition and supplement of *Das Leben und Wirken* brought Dürer literature down to the date 1869, at which point it might have been supposed, after such thorough investigations, that (to return to my first simile) the mine was well-nigh exhausted, or at all events would yield no more at present. Workers were, however, still left in it, and the result of their labours has now to be reviewed.

First comes G. W. K. Lochner, who in 1870 published his researches into the per-

* *Nachrichten von den Vornehmsten Künstlern und Werkleuten so innerhalb hundert Jahren in Nürnberg gelebt haben.* (Nürnberg, 1546.)

plexing subject of the personal names mentioned in the letters from Venice.

Several of the names which Dürer's early commentators and English translators rendered as common substantives, such as "der Drahtzieher," which Mr. Scott and myself translated literally, "the wire-worker," "wire-drawer;" and "der alt Kormeele," boldly translated by Mr. Scott the "old corn-mill," but for which I could find no meaning, turn out to be the names of persons with whom Dürer was acquainted in Nürnberg. "Der Bot Kannengiesserle" and "der Ferber Bot," are also considered by Lochner to be the proper names of the messengers, and not, as I understood them, the names of the trade-guilds by which these messengers were employed. This, however, still seems to me doubtful. The "Endres," who is mentioned in Letter VI. as being at Venice in a weak state and in much need of money, and to whom Dürer lent eight ducats, is more probably the Endres Künhofer, who sends his service to Pirkheimer in Letters III. and IV., than Andreas Dürer, as before supposed, for although to "Mrs. Heaton, as an Englishwoman, a journey to Venice appears a mere outing—a trip,"—Herr Lochner, as a German, thinks it unlikely that Andreas Dürer should have travelled so far even during his *Wanderjahre*. This, however, remains a matter of opinion. There is no proof one way or the other. Who the Rosentalerin was, and whether she was identical with the sketch of a rose given in Letter II.; who the other persons were, signified by symbols in Letter II. and by abbreviations in Letter VIII., has not yet been discovered. Nor is the mystery of the Rechenmeisterin solved. It is clear that in Letter VII., at all events, where she is spoken of to Pirkheimer as "Eure Rechenmeisterin," and a villanous caricature of her or some other person drawn, that it is not Agnes who is meant; indeed, the allusion to her in Letter VI. is very doubtful. Herr Thausing considers Rechenmeisterin to be a personal name, and that the person alluded to was a female member of some family in Nürnberg called Rechenmeister; but Herr Lochner agrees with me in thinking it more probable that she was some housekeeper or keeper of accounts in Pirkheimer's service. Possibly Pirkheimer, being a widower, might, to avoid scandal, have chosen some one of not very attractive appearance to hold this office, and hence Dürer's chaff. This is supposing that the caricature is meant to represent the Rechenmeisterin; but it seems to me to refer to the fascinating creature, "die Stube," whom Dürer calls "ein Unflath"—a dirty person, slut. Herr Thausing, however, brings forward a new but somewhat far-fetched interpretation of this impolite greeting. The whole passage reads thus: "Grüst mir den Porscht, Her Lorentzen und unser hüpsch gesind als auch ewer rechenmeisterin und danckt nur ewer sthuben daz mich grüst hatt sprecht sy sez ein unflath." Then comes the caricature, and the letter continues: "Ich hab ihr olpawmen Holz lassen fürn von Fenedich gen awgspurg do las ichs liegen woll 10 zentner schwer, und sprecht sy hab sein nit wollen erwarten pertzo el

sputzo." It has been always supposed that the "Stube" (*Stube*, presumably short for *Stuben-magd*), who greeted Dürer, was one of the "hübsche Gesind," or female domestics, of Pirkheimer's household, previously greeted by him; but Herr Thausing, who renders "hübsche Gesind" as "schöne Welt" (fair sex), makes the term "Stube" refer to Pirkheimer's brain, and supposes that Dürer thanks that for not having forgotten to give him the greeting of the Rechenmeisterin. This view of the question is based on a passage in another part of the letter, in which Dürer remarks: "Ein sthuben mus mer den 4 winkell haben dorein man dy gedechtniss gotzen setzt" (a chamber must have more than four corners for one to place in it the images of memory). Here the allusion clearly is to the chambers of the brain. Dürer is, in fact, venturing into metaphysics; but it is difficult to suppose that the same thing is meant in the preceding passage, although the same word "stube" is used. Nor does Herr Thausing's interpretation touch the subject of "her" or "its" olive-tree wood, of which "ten hundred weight is lying at Augsburg." Both Lochner and he consider this some jest that could only be understood by the two correspondents. The Italian quotation at the end of the mysterious sentence, "Perciò il puzzo" (thence the stink), certainly does not tend to clear it. What stinks? Whether it is the perplexing "Stube," Pirkheimer himself (Dürer uses that polite expression respecting his friend in another place), or the olive-tree wood, remains still a matter of doubt.

Concerning the Imhofs, the Baumgärtner, the Volkamers, Anthon Kolb, the "Schwager" (brother-in-law) of Dürer, Bernhard Hirschvogel, Bernhard Holzbeck, and other persons mentioned in the Letters, Lochner has collected a large amount of genealogical information.

Herr Thausing's opinions on certain points have been already quoted. He is a well-known Dürer investigator, and the chief champion of Agnes Frey. His first article in vindication of her appeared in the *Zeitschrift für Bildende Kunst* in 1868, and roused the question whether there was any truth in the accusations Pirkheimer brought against her in his famous letter concerning Dürer's death. Dürer himself, it is true, never complains of his wife; but that proves nothing one way or another, he scarcely ever alludes to her, and it is difficult to see why Pirkheimer's statements should be altogether discredited, even supposing him to have had a dislike to his friend's wife as an "honourable, pious, and very God-fearing woman."

One of my German critics accuses me of traducing the character of the learned Willibald, but surely it is traducing it far more to affirm that the statements in his letter to Tscherte were merely spiteful untruths. I have called his Excellence, it is true, "an immoral old pedant," but the defenders of Agnes make him out a wicked old liar. But Herr Thausing's present work has nothing to do with the vexed question concerning Dürer's *Hausfrau*; it is simply a translation into modern readable German of Dürer's Letters, Journal, and Rhymes, with elucidatory notes gleaned from Lochner, Eye,

and other commentators, and some few original ones.

It is surprising that this task has never been attempted before. Had it been, it would have saved Dürer's English biographers half their labour. At last, however, in the third publication of Eitelberger von Edelberg's valuable series of *Quellen-schriften für Kunstgeschichte*, we have all Dürer's personal writings properly edited, commented, and annotated, so that Dürer students may now enjoy them, without the necessity of making themselves acquainted with provincial German of the fifteenth century. Herr Thausing professes to fear that the aid he affords by this translation will not be acceptable to many: "Dem Geschichts-forscher nicht, weil er des Originaltextes nicht entrathen kann, dem Laien wieder nicht, weil ihn an der Uebersetzung noch immer manches Ungelenke und Fremdartige stören wird, und vollends nicht dem deutschen Philologen, der viel weitergehende Anforderungen an eine derartige Ausgabe zustellen gewohnt ist." A revised edition of the original text is certainly needed, and would no doubt be useful to historians and philologists; but "laics," or general readers, may congratulate themselves in not finding more that is heterogeneous and uncouth in this rendering. It will especially be a boon to foreign students, who cannot be expected to be acquainted with obsolete forms of expression in a language not their own.

Besides the well-known letters to Pirkheimer and Jacob Heller, the Journal and other writings published by Von Murr and Campe, one entirely new letter is here given, besides one or two others that have only appeared before in journals and since the English translations. The new letter is addressed by Dürer to Wolf Stromer, and runs thus:—

Dear Herr Wolf Stromer,—My gracious Lord of Salzburg has sent me a letter by his glass-painter. Anything that I can do to serve him I will gladly do. He wants to buy glass and other material here. He informs me that he has been robbed near Freistädtelein, and twenty gulden taken from him. He has asked me to direct him to you, for his gracious lord has recommended him, in case he wants anything, to obtain it from you; so I send him with my apprentice to your wisdom. I commend myself to you.

Your Wisdom's

ALBRECHT DÜRER.

This, as will be seen, is merely a short letter of recommendation, addressed by Dürer to some one in Nürnberg. It is without date, and on the back side of the sheet is a pen drawing of some sort of automaton, with the inscription underneath in Dürer's handwriting, "Niklas am rosmargt." The original manuscript is now in the possession of Herr Cornill d'Orville of Frankfurt. As it has never been published before, Herr Thausing gives it in the original German, as well as in his modern rendering.

Of far greater interest—of greater interest, indeed, than any other of Dürer's letters—is one addressed to George Spalatinus,* the chaplain and secretary of the Elector Frederick the Wise, and the well-known reformer and friend of Luther. The original of this

* Properly Georg Burkhard, of Spalt. He received his first education in the Sebaldschule at Nürnberg.

letter was found, with another addressed to Hans Amerbach, among the autographs preserved in the library at Basel, and was published by Ed. Hischeusler in the *Zeitschrift für Bildende Kunst*, iii. 7. The following translation of it may be acceptable to English Dürer students:—

Dürer to Georg Spalatin.

Nürnberg: beginning of the year 1520.

To the reverend, very learned Herr Georg Spalatin, chaplain to my gracious Lord Duke Frederick the Elector.

Most honoured dear Sir,—I have already conveyed my thanks in the little letter to you, when I had read no more than your little note. It was only afterwards, when I turned out the bag in which the little book was done up, that I found the actual letter inside, from which I learnt that my gracious Lord himself had sent me Luther's little book. Therefore, I pray your honour to present my most humble thanks to his Electoral Grace, and to beg his Electoral Grace to let himself be governed by the praiseworthy Doctor Martinus Luther, for the sake of the Christian truth, which is of more consequence to us than all the riches and power of this world; for all that perishes with time, but the truth remains for eternity. And if God helps me that I come to Doctor Martinus Luther, I will take his portrait with diligence and engrave it on copper, to be a lasting memorial of that Christian man who has helped me out of great anguish. And I beg your honour, if Doctor Martinus writes anything new that is in German, that you will send it me for my money.

And as you likewise write to me about the little book in defence of Martin (*Schutzbüchlein*), know that there are no more to be had. They are printing them, however, at Augsburg. As soon as they are ready I will send it to you; but know that this book, although it has been written here, is spoken against in the pulpit as an heretical book that ought to be burnt, and he who has published it without signature is abused and shamefully spoken against.* Doctor Eck, indeed, they say will publicly burn it at Ingolstadt, as happened once to the little book of Doctor Reuchlin.

At the same time with this I send my gracious Lord three impressions of a copperplate that I have engraved according to the desire of my gracious Lord of Mainz. I have presented his Electorship with the copperplate and 200 impressions, on which account his Electorship has shown himself very gracious towards me, for his Electorship has sent me 200 gulden in gold, and 20 ells of damask for a coat; the which I have received with joy and thankfulness, especially as I had great need of them at that time.

For his Imperial Majesty [Maximilian] of praiseworthy memory, who departed from me too soon, had in his grace provided for me on account of the great trouble, care, and work that I had had. But the hundred gulden that I was to have received every year all my life long from the town rates, and that I received yearly during his Majesty's lifetime, my Lords [the Rath of Nürnberg] will now no longer pay, so I am obliged to deprive myself in my old age, and have lost a long time and all the trouble and work that I undertook for his Imperial Majesty. And if my sight and freedom of hand fail me, things will not go well with me. I have not been silent about this to you, because you are my trusted kind friend.

I beg your Reverence, that if my gracious Lord will remember his promise of stags' antlers, that you will remind him of this, so that I may get a fine pair of horns, for I want to make two candlesticks out of the u. Also I send with this

two engraved Crucifixions. They are engraved in gold, and one is for your Reverence. Present my service to Hirschfeld and to Albrecht Waldner. Herewith, your Reverence, commend me truly to my gracious Lord the Elector.

Your willing

ALBRECHT DÜRER,
zu Nürnberg.

The original manuscript of the *Reise-Journal* (Journal of Dürer's tour in the Netherlands) is unfortunately lost; it is supposed to have been burned, and Hauer's copy of it, printed by Von Murr, is evidently very faulty. Campe made some corrections, and Herr Thausing solves a few more of the difficulties, some of which he considers to have arisen merely from misreadings. The Dutch translator, F. Verachter, has rendered intelligible many of the allusions. His notes, which were of great use to me, are often quoted by Herr Thausing. A map showing the route that Dürer travelled, and the towns in which he spent his *stüber* and *weispfennige* is also provided.

The Dürer family chronicle, Dürer's prosaic verses, and a few other fragments, with the dedications to Pirkheimer, make up the remainder of Dürer's personal writings; but an interesting appendix is added, containing writings about Dürer, and addressed to him (*Zuschriften an und für Dürer*). Among the latter is the letter from the learned Charitas Pirkheimerin, sister to Pirkheimer, to the "good friends Caspar Nützel, Lazarus Spengler and Albrecht Dürer," printed by M. Mayer; and another, in Latin, from Cornelius Grapheus to Dürer, communicated by W. Mitchell, and printed now for the first time. The writings of the Emperor Maximilian and Charles V., to the Rath of Nürnberg, concerning the Imperial grant to Dürer—the "Privilegium" and the "Confirmatio," that cost Dürer so much trouble and labour,—were printed by M. M. Mayer in *Des alten Nürnberg's Sitten*; and the dedications of Lazarus Spengler and Pirkheimer have been reprinted before, since their original publication in the works of these two authors. These, with the letter of Tscherte to Dürer in the British Museum, a fragment of a letter from an unknown writer, and one or two other documents, make up the Appendix, which does not contain Pirkheimer's letter concerning Dürer's death, nor several other important writings that would have been acceptable in a collection of writings "an und für Dürer." Even Luther's letter to Scheuerl, the town-clerk of Nürnberg, in which the portrait is mentioned, which, as we know, Dürer really achieved as "a lasting memorial of that Christian man," might well have been included.

But these are small omissions that can easily be supplied from other works; and it is perhaps ungracious, when so much is given us, to hint that we should like more.

The other recent contributions to Dürer literature—contributions to our knowledge of his works—must be considered in another notice.

MARY M. HEATON.

about ten feet below the surface of the soil, upon a small grotto with a low narrow door, and within it five large terra-cotta slabs, on which were painted figures remarkable for their very fresh and bright colours. On the back, adhering to the slabs, were here and there fragments of mortar, showing that they had served for wall decoration (*carreaux de revêtement*). On the two slabs which were found lying near the entrance were depicted two female sphinxes, seated on their hind legs, one with the right paw raised, the other with the left, with cold motionless gaze, guarding, as it were, the entrance to the tomb. Their hair was long and black, the flesh tints white, and their wings terminating, after the archaic style, in recurved points, the feathers painted alternately red, black, and white.

The other three slabs, which lay at the further end of the tomb, placed together, formed a composition of nine figures, three on each slab. The first is occupied by three women: two apparently of mature years, the other young, and seemingly of more elevated rank. Each of the two first holds an alabastron, the one of alabaster, the other of black ware. Their dress is identical, only varying in colour; the one a red tunic with white hem, the other a white with black hem. The mantle of the first is black with white hem, of the second red; one has black sandals, the other red. Greater freedom is shown in depicting the third figure: the costume is appropriate to the age and condition—a tunic open in front, without sleeves, displaying the white arms and bracelets. She is in the act of fastening a girdle, which from its whiteness appears to be silver.

Before the damsel are two elegant youths, each wearing a red chlamys, their heads uncovered, their rich black hair descending to their shoulders, their legs decked with the cothurnus, fastened with silver buckles. They are looking at the ladies, to whom they offer pomegranate flowers which each holds in his hand. If there were any doubt of this representing a love scene, the gift of the pomegranate alone would dispel all uncertainty.

Behind the two young men is a girl in a short red tunic, loose hair, and feet unshod; this characterises the servant. She holds in her hand a box, which she offers to two bearded men, who form a curious contrast to the youths, being clumsy in figure, without shoes or cothurnus, one in a pointed cap, the other in a low beretta. One holds a leafless branch in his hand, the other a long stick surmounted by the figure of an ox. The leafless branch would seem to indicate mockery and impudence. On a vase in the Museo Borbonico at Naples, a woman is placing one on the pointed cap of Thamyras, out of derision at his daring to challenge the Muses to sing.

The subject of the composition is a love scene. The two favoured youths are paying their addresses to a young lady, and the red bearded men are laughing at them in scorn and derision. Nor is it matter of surprise that such subjects should be found in a tomb. Little light has yet been thrown upon the views of the Etruscans relative to a future state; but this we know, that the subjects which most often occur on their sarcophagi or their tombs are feasts, dances, games, sometimes even Bacchanalian scenes in which decorum is not the element most respected. It is, therefore, quite in accordance with the spirit of Etruscan art to find love scenes represented upon these wall tiles. Two similar sets of painted tiles were previously known, both from Cervetri: one found in 1857, and forming part of the Campana collection; the other said to have been discovered in the same locality, in 1861. These new paintings confirm the supposed spuriousness of the second picture, and establish the genuineness of the first; they also enlarge our knowledge of the technique of Etruscan art. The style, colouring, and design are strictly archaic; the resources of the palette poor—white, red, and black, and a kind of violet resulting from the fusion of the two last. The

ETRUSCAN PAINTINGS AT CERVETRI.

THE *Gazzetta Ufficiale* states, that in making excavations in the inexhaustible necropolis of Cervetri (Caere), the brothers Bocanera have come,

* This heretical work was written in defence of Martin Luther's teaching by Lazarus Spengler, Dürer's friend. It was published anonymously in 1519, and Luther mentions it in a letter to Spalatin in January, 1520. It is the mention of this *Schutzbüchlein* that determines approximately the date of Dürer's letter.

artist stoops to render the minutest details, such as the hem of the garments, the eyelashes, nails of the hands and feet; his figures are drawn in profile, and in a line like a procession.

The Italian Government are in communication with Prince Ruspoli, its possessor, to secure this curious work for the National Museum. A full account of these paintings, with remarks on their bearing on the history of early Etruscan painting, is given in the new number (May) of the *Bullettino dell' Instituto di corrisp. Arch.*

ART SALES.

THE sale of Mr. Barker's library, on the 24th and 25th ult., completed the dispersion of his valuable collections. The books consisted mostly of illustrated editions of French and Italian authors, bound by Derome, Bradel, Padeloup, Lewis, Holloway, Bedford, Wright, and other eminent artists. The following are some of the prices realised. Boccaccio: *Il Decamerone*, 5 vols., with engravings after Gravelot, Boucher, &c., and the suppressed plates inserted, 38 gs. *Le Decameron traduit par Le Macon*, bound by Padeloup, 27 gs. Dibdin's *Bibliographical Tour*, bound by Bedford, 2s. *Horae Beatissimae*, Italian missal of the sixteenth century, on vellum, Grolier binding, 55 gs. La Borde, *Choir de Chansons mises en Musique*, illustrated with engravings, 4 vols., in red morocco, by Derome, from the Bernal collection, 103l. La Fontaine, *Contes et Nouvelles: Edition des Fermiers Généraux*, with the plates *Le Cas de Conscience* and *Le Diable de Papefiguière* in the first state, bound by Bradel, 59l. La Fontaine, *Fables*, 6 vols., 49l. *Les Amours de Daphnis et Chloé*, traduit du Grec par Jacques Amyot, with plates by Audran after the designs of Philip, Duke of Orleans: Paris, 1718. This copy formerly belonged to M. Chastre de Cangé, valet de chambre of the Regent Orleans, and contains the original pen-and-ink sketch by the Regent for the engraving known as *Les petits Pieds*, with a list of the plates, as originally projected, in his handwriting. Also an etching by the Count de Caylus, and marginal notes by Antoine Launecot, 80l. Marguerite, Reine de Navarre, *Heptameron François ou Nouvelles*, 30l. Molière, *Works*, 3 vols., old red morocco, bound by Lewis, 30l. *Le Temple de Guide*, in red morocco, by Derome, from the Leburne collection, 101l. Ariosto, *Orlando Furioso*, Venezia, 1773, with 610 illustrations from other editions, 46 pen-and-ink portraits, splendidly bound, by Wright, in yellow morocco, dentelle borders, 75 gs. A. du Cerceau, *Les plus Excellents Bâtements de la France*, folio, Paris, 1776-9, 22l. 15s. *Stultifera Navis, or The Ship of Fools*, Alex. Barclay, black letter with woodcuts, published by J. Cawood, 1570, 18l. 5s. *Galerie Impériale de Vienne*, proof impressions, 54l. *Chronicles of England*, edited by Sir H. Ellis, 25l. Du Sommerard, *Les Arts au Moyen Age*, bound by Holloway, 70l. *Télémaque*, Amsterdam, 1761, bound by Padeloup, 25l. *French Costumes of the Eighteenth Century*, 41l. *British Gallery*, coloured engravings from the old masters, 34l. *Justiniani Novellae Constitutiones*, bound by Grolier, 11l. 5s. La Fontaine, *Fables Choisies*, 4 vols. folio, engravings after Audry, Paris, 1775, fine copy, bound by Padeloup, from the Prince of Essling's collection, 200l. Litta, *Famiglie Celebre Italiane*, 60l. Horace Walpole's *Anecdotes of Painting*, 10 vols. 4to., 42l. Ovid, *Métamorphoses en Latin et François*, 33l. Rabelais' *Works*, 40l. Walton and Cotton, *Complete Angler*, 444 additional portraits, 81l. *Musée Français*, 7 vols. folio, 155l. Rosini, *Storia della Pittura Italiana*, bound by Bedford, 144l. Shaw's *Dresses and Decorations*, bound by Lewis, 35l.

There were about 100 lots of engravings: *The Three Coligny's*, by Duval, 15l.; *Duchesse de la Vallière*, N. de Larmesse, 13l. 10s.; *Orange Family on Horseback*, 11l.; *William of Orange*, by Wieix, 10l.; *Set of the Seasons*, represented by English ladies in the costume of the period, 1643, by Hollar, 17l. 10s.; Albert Dürer's *Knight and Death*, 49l. The whole sale realised 4,000l.

At the sale at Sotheby's, on Friday and Saturday last, of the remainder of Mr. Pole Carew's engravings, and of those of some other collectors, there were amongst the lots some rare engravings of Martin Schöngauer's, in fine condition, and fine impressions. A brilliant impression of the *Crucifixion* (Bartsch, No. 22) was knocked down to Messrs. Holloway and Son for 87l. Another, being a different treatment of the same subject, fetched 41l.; while a third print of Schöngauer's, *The Almighty seated on his Throne, with an Angel on either side*, realised 87l. There were two or three other prints by the same master. How did Mr. Pole Carew contrive to become possessed of the absolutely worn impressions of Claude's famous etchings, which being artistically speaking worthless, were deservedly knocked down at a few shillings apiece? Only two appeared of any value at all. They fetched rather more. We are hardly free to name them, as they did not form part of a public exhibition. They were poor impressions of favourite subjects, and for these, amongst a certain class of buyers, there is always some little demand. A number of prints from Sir Joshua's portraits were included in the same sale. Of these, the only very notable one was that by Watson after Sir Joshua's *Mrs. Abington as the Comic Muse*. It was described as a brilliant artist's proof, before any letters, but the catalogue, in error, ascribed it to S. W. Reynolds, instead of to Watson. It fetched 22l. It is rare; and Dr. Hamilton, in his just-issued book on the subject of the prints after Sir Joshua, tells us that the picture is at Knoke, and that it was painted in 1764 or 1765; that is, some four or five years before the engraving was made.

A number of impressions from Turner's *Liber Studiorum* were disposed of at the same sale. Many were "second states;" some were "first states;" and two were of the yet rarer, but not more meritorious, kind known as engraver's proofs. One of these, the *Farm Yard*, sold for 18l.; the other, *Lucracy Castle*, sold for 24l. In these cases, though the impressions are brilliant, the rarity must be the great attraction; since it was only in the first published state that the pictures appear to have fully satisfied Turner himself, who, until that stage, had been constantly making changes in their effect, or desiring these to be made, for the purpose of improving them. But as long as human nature exists, rarity will be an attraction; a "first state" may fetch much, but an engraver's proof will probably fetch still more.

THE jewelled insignia of various Orders conferred on the late Duke of Brunswick were sold on the 25th ult. at Messrs. Debenham and Storr's, Covent Garden, and produced the following prices:—The cross of the Order of St. Stephen of Austria, consisting of brilliants, emeralds, and rubies, 170 gs.; the star of the same Order, 225 gs. The insignia of the Order of Henry the Lion of Brunswick were very splendid. The collar, composed of four horses in fine brilliants, with four crowns in brilliants, emeralds, rubies, and sapphires, sold for 315 gs. The badge, consisting of a white horse, also in diamonds, and the motto "Semper idem," comprising a large number of brilliants, emeralds, and rubies, 197 gs. The star of the same Order, of large brilliants, 215 gs.; the grand cross of the Order of the Lion of Zähringen, of Baden, 67 gs.; the star of the same Order, composed of splendid white brilliants, arranged in eight rays, the lion and motto on a ground of rubies, 230 gs. The grand cross of the Order of Christ of Portugal, 88 gs.; and the star, 80 gs. The grand cross of the Order of Fidelity of Baden, composed of carbuncles connected by diamond monograms and other rare jewels, 80 gs.; and the star of the same Order, 230 gs. The decorations of the Golden Fleece consisted of the collar, composed of sixteen fusils and flint stones, connected by scroll-work, and the fusils each with a cabochon sapphire, the

flint stones encircled with rubies, 350 gs. The badge sold for 158 gs., and the cross for 72 gs.

The cross of the Order of St. Hubert of Bavaria, a Maltese cross with a pendant of rubies, sapphires, and brilliants, 170 gs.; and the star 240 gs. The grand cross of the Guelphic Order of Hanover, 108 gs.; and the star, a splendid specimen of the jeweller's art, 302 gs. The cross of the Order of Louis of Hesse, 75 gs.; the Star of the same order, with the motto "Gott ehre Vaterland," 218 gs. In addition to these were: the Order of the Lion and Sun, of Persian workmanship, 45 gs.; and a superb pendant, composed of remarkably large opals, surrounded by splendid brilliants, the property of a nobleman, 2,000 gs. The gallery was crowded, and there was considerable competition for the various lots.

THE following pictures, being a portion of the collection formed by the late Mr. Jonas Cressingham, of the Grove, Carshalton, were sold on Saturday and Monday last, by Messrs. Christie, Manson, and Woods: J. Lingebach, *A View in Italy: a Village Festival*, 85l. G. Morland: lot 19, *Interior of a Peasant's Cottage, dinner-time*, 50l.; lot 20, *Saturday Night*, 173l.; lot 22, *Sunday Morning*, 278l. T. S. Cooper, R.A.: lot 124, *Interior of a Shed, with a sheep and a calf*, 152l.; lot 126, *A Mountain Group, evening*, 241l.; lot 129, *Autumn*, 315l.; lot 130, *Cooling the Hoop*, 462l. C. W. Cope, R.A., lot 125, *Oliver Cromwell receiving a Deputation of Ministers and Elders*, 100l. R. Ansdell, R.A., lot 127, *Donkeys and Gipsies on a Common*, 357l. E. W. Cooke, R.A., lot 128, *Vinegia, Vinegia*, 315l. F. R. Lee, R.A.: lot 131, *Plymouth Breakwater*, 162l. 15s.; lot 133, *Oaktree Ford and Market Cart*, 286l. 10s.; lot 140, *A Misty Morning, with figures*, 120l. 15s. S. A. Hart, R.A., lot 132, *Archbishop Langton in the Cathedral of Old St. Paul's, exhorting the Earl of Pembroke and the Barons*, 89l. Joint works by F. R. Lee and T. S. Cooper: lot 134, *Summer Breezes*, 588l.; lot 135, *The Watering Place*, 682l. 10s.; lot 138, *An Avenue of Scotch Firs near Barnstaple, with sheep*, 330l. 15s.; lot 141, *Mountain Scenery, with cattle*, 409l. 10s. Lot 142, a joint work by J. Phillip, R.A., and R. Ansdell, R.A., *Going to be Fed*, bought by Messrs. Colnaghi for 798l. J. W. Whittaker, lot 168, *The Carnarvonshire Range (water-colours)*, 83l. Colin Hunter, lot 229, *Sea Fishing*, 136l. 10s. L. Van Leyden, lot 251, a triptych, with the *Worship of the Golden Calf*, from the collection of the Marquis de Bloisel, 68l. 5s.

NOTES AND NEWS.

IN the list just published of the objects of art acquired, either by purchase or gift, by the French National Museum, during the year 1873, we observe the purchase of *The Cottage*, by Constable, for 25,725 fr.; and the bequest, by Mr. J. Wilson, of *Weymouth Bay in an approaching Storm*, and *The Rainbow*, by the same master.

AN inscription is now in the course of being engraved upon the pedestal of the statue of Ingres, placed in the vestibule of the Ecole des Beaux-Arts, recording that it has been erected by the pupils of the Ecole. The artist is represented with a pencil in his right hand, while with the left he holds an open roll, upon which are inscribed these words: "Le Dessin est la probité de l'Art."

A MONUMENT to the memory of Henri Regnault, and six other young French art students, who were killed in the late war, is, as already announced, to be erected in the Cour du Mûrier of the Ecole des Beaux-Arts. The design has been made by two young architects, MM. Coquart and Pascal, comrades of Regnault during the war, and his bust, which is to surmount the pedestal, is the work of the sculptor Degeorge, who was also one of his friends. The bust is to be of bronze, but the rest of the monument will be of white marble. The single word *Patrie* in letters of gold amidst laurel branches is

the only inscription, with the exception of the names of the six students, the date of their death, and the place where they fell, which are engraved on two columns that support the entablature. An allegorical figure of *La Jeunesse* holding a branch of laurel in her hand is sculptured in relief on the pedestal. The glorification of youth is indeed the chief sentiment of the monument, and for this reason, no doubt, its execution has been confided to youthful artists; unlike youthful works in general, the design is characterised by great simplicity of ornament.

PROFESSOR BARZAGHI has been commissioned by the city of Milan to superintend the erection of the monument to the ex-Emperor Napoleon III., which is to be raised by the city in grateful memory of the services rendered by him in bringing about the freedom of the Milanese from Austrian domination. The statue is to represent the Emperor as he stood, hat in hand, prepared to receive the greeting of the people on their first restoration to freedom.

THOSE who like to have "pretty pictures" to lie on their drawing-room tables and for nursery admiration, will do well to take in the *Picture Gallery*, a periodical which offers every month three excellent reproductions in permanent photography of some of the most popular pictures of the day. The "Woodbury process," as it is called, by which these reproductions are printed, is about the most satisfactory of the many photographic printing processes in use at the present time. The illustrations in the *Picture Gallery* are remarkable for their sharpness and brilliancy.

It has hitherto been the custom with the Commission of Fine Arts for the Prefecture of the Seine to order every year a certain number of copies from the paintings in the Louvre for the decoration of the metropolitan churches. These works have been generally executed by female artists; but on the proposal of the Prefect of the Seine it has been decided that these copies shall be discontinued, and replaced by pieces done by the pupils of the *Ecole des Beaux-Arts*.

THE coming International Congress of Pre-historic Archaeology will distinguish itself by excavating one of the tumuli of the ancient Swedish kings at Upsala, which are perhaps the largest north of the Alps. One of them was opened in 1846-7, but no discoveries of any great value took place.

THE Dardanelles correspondent of the *Levant Herald* says that the statements which appeared recently in the papers relating to Dr. Schliemann and further excavations at Hissarlik, are altogether incorrect. The Turkish Government has made no arrangement with Dr. Schliemann for continuing the excavations at Hissarlik, and has not, as stated, caused the work to be continued for its own account. Two of the slabs in the gateway which was recently discovered have been slightly displaced by some peasants. The new stratum and the more ancient pavement of large chalk-stone slabs, said to have been discovered at a much greater depth, do not exist. There can be no doubt, however, that much more remains to be done at Hissarlik than Dr. Schliemann has been able to accomplish.

MR. CHRISTIAN has prepared plans for the restoration of Much Marcle Church, Herefordshire, a fabric presenting many unusual features, and altogether of a type rarely found in a country village. It consists of a large chancel opening through two Early English arches into a north chapel; a nave, with an Early English arcade of four arches on either side communicating with the aisles; a lofty clerestory of single lancets (now blocked up), and a Perpendicular tower built between the nave and the chancel, and quite clear of the aisles. The tower is supported by two large pointed arches, opening into the chancel and nave, and lit, in the lower part, by two tiers of double windows. The history of this tower is

interesting. It was built about the year 1414 in accordance with the will of Thomas Walwayn, and the materials employed in its construction were derived from "the ruins of an old castle . . . which had a mote about it, and stood neare y^e church" (*Harl. MS. 6720*). The castle here indicated went by the name of Mortimer's Castle, and was probably built by Edmund de Mortimer, to whom King Edward I. granted two-thirds of the manor of Much Marcle. In the chancel are two high tombs dating from the latter half of the fourteenth century. Blount, following the tradition current in his day, refers one of these to Roger de Mortimer, the ambitious and ill-fated suitor of Queen Isabella, and his wife Joane de Genevil; and the other is, by the evidence of the coats of arms attached to it, the monument of Blanch, daughter of Roger Mortimer and wife of Sir Peter de Grandison, elder brother of John de Grandison, Bishop of Exeter. On a window-sill in the south aisle is a cross-legged wooden effigy of a squire, belonging to a rather earlier date. Mr. Bloxam states that examples of civilians represented with their legs crossed are extremely rare, and that only two others, viz., at Thurlaston, co. Leic., and Birkin, co. Ebor., have come under his notice. The north chapel was built or restored by Sir John Kyrle, whose monument, said to have been executed in Italy, is its greatest ornament. The chief structural peculiarity of the church arises from its following the slope of the ground towards the east, so that the chancel floor is lower than that of the nave, and the eastern half of each arch of the nave arcades is longer than the corresponding western half—the piers sinking in regular gradation from west to east. It may be added that the parish is on many accounts classic ground. Within its limits Sir James Audley, K.G., the hero of Poitiers, sometime lived, and in later times the Fells were among the owners and occupants. Dr. Samuel Fell, Dean of Christ Church, and of Hall Place in Marcle, was father of Dr. John Fell, Bishop of Oxford, whom Tom Brown, the epigrammatist, could not like, but whom Evelyn praises as a good man, albeit a preacher in blank verse. Marcle, moreover, was the birth-place of Judge Tracy, "a complete gentleman and a good lawyer," who was twice chosen as a Commissioner of the Great Seal. The cost of the projected restoration is estimated at 2,000*l.*, a large sum to be obtained in a place more famous in the past than in the present.

THE engineer Zannoni, who has so zealously pursued the excavations undertaken at Bologna, writes to the *Monitore di Bologna* that he has made another archaeological discovery closely connected with his former ones. In a cutting made for the new aqueduct at the barracks of the *Annunziata*, he came upon five sepulchres, in one of which he found a large vase filled with burnt bones, and among them some fibulae and two bronze armillae; also an enormous quantity of amber, two large rings for the ears exquisitely worked, having each a ring of pure gold and two of silver, with headings of gold leaf. One fibula was of gold, and ornamented with quadrupeds. In the middle of the vase was a heap of objects in bronze—fibulae, armillae, pins, and one of those shovel-shaped ornaments now believed to be a bell (*tintinnabulum*). There are also vases engraved, and bronze vases appearing for the first time in conjunction with gold and silver, both of the last of the finest quality.

Signor Zannoni considers this discovery as showing that there were public roads from each of the city gates, and that groups of tombs were disposed along them belonging to the corresponding parts of the city.

SOME time since the St. Martin's School of Art sent to the sketch clubs of the various metropolitan schools of art an invitation to join with them in the first annual competition between the clubs. The terms of the competition were as follows: Three subjects were selected, comprising figures, landscape, and animals, the sketches for which

were to be worked out in any material. The award of honour was to be made to the club producing the best aggregate amount of work, and prizes, each of equal value, were also to be awarded for the best sketch in each subject. The subjects chosen were, for figures, "Freedom;" for landscape, "Evening;" and for animals, any subject from the fables of Aesop.

The Lambeth School of Art being the only school which had responded to the invitation, the sketches sent in by the members of the sketching club of that school, and by the members of that of St. Martin's were exhibited at the St. Martin's School on Wednesday the 24th ult. Mr. Parker (head-master, St. Martin's School), and Mr. Sparkes (head-master, Lambeth School), were in attendance.

Mr. Parker said he regretted the absence of Ph. Calderon, Esq., R.A., who had acted as judge in the matter, and had expressed himself much pleased with the sketches in general. He had, however, no hesitation in deciding that Mr. Lucas (St. Martin's School) deserved the prize in the figure subject for his water-colour drawing of a tavern scene. He had also spoken in high terms of the illustration of Gray's *Elegy in a Country Churchyard*, by Mr. Phillips (Lambeth), to which he awarded the prize for the landscape subject; and he had awarded the prize in the third subject to Mr. Beere (Lambeth) for his carefully modelled figure of a couching lion. The award of honour was to the Lambeth School more especially on account of the high quality of the models exhibited by the students at that school.

Mr. Parker regretted very much that the Lambeth School was the only one which had answered the invitation, and expressed a hope that the challenge which would be sent out next year would be more generally accepted.

IN an article in the *Nuova Antologia*, headed "Gli Scavi e gli Orgetti d'Arte in Italia," Signor Ruggiero Bonghi, of Rome, urges on the Italian Government the necessity of supervising excavations in Italy, and generally of taking more care of the various museums. He complains that Italy is ransacked of works of art for the good of other nations. Italy has now become a nation, and ought to realise its national unity in intellectual matters. Its great interests ought no longer to be dissipated by personal, municipal, or provincial considerations. He proposes as objects for the care of government, the organisation of the various scattered museums, a more exact knowledge of works of art scattered throughout the country, and the continued supervision of all excavations. The Louvre and the British Museum are being continually enriched from Italy, while Italy herself gains nothing. He urges that excavations should be conducted systematically in the most important places, and that a recognised government official should be present at all excavations, and should give a formal report of all discoveries, which should serve as a guarantee of their authenticity. The expenses of this supervision may be met, partly by a payment made by visitors on working days, partly by an agreement with the municipalities and provinces in which the excavations are being made: if they reserve the right of keeping the objects discovered, it is but fair they should contribute towards the expenses of discovery and custody. He suggests two means for furthering this object—first, the formation of archaeological academies at Pompeii, in Rome, in Sicily, in Etruria, and in North Italy; and, secondly, the publication of an accurate archaeological map of Italy.

These suggestions are most valuable, and we hope they may awaken some attention. It is natural for an Italian to wish his country to retain its treasures; and antiquities lose their living interest if removed from their immediate surroundings. We are glad to welcome this patriotic movement, and trust it may meet with success.

AN interesting discovery has lately been made

at Cividale, the "Civitas Austriae" of the Lombards, where some workmen engaged in laying down water-pipes across the Piazza di Paolo Diacono struck upon a flat hewn stone, about ten feet below the surface, which looked like the covering of a grave. In accordance with the orders given to the workmen, information of the discovery was conveyed to the Syndic de Portis, whose attention had been directed to the spot, since in the course of some recent excavations he had found the remains of old walls, fragments of marble mosaics, and shreds of textile fabrics, which although of little real archaeological value, afforded evidence of the existence of some building of note. On a further prosecution of the excavations, which were conducted in the presence and under the direction of the Signor de Portis and the Director of the local museum, it was found that the stone plate formed the top of a piece of masonry, within which stood a stone sarcophagus covered with a vaulted marble lid, with horn-like prolongations at the four corners, and having circles carved on either side. Within the sarcophagus were found a few human remains, most of which—as the cranium, pelvis, and lower extremities—were almost entirely destroyed, whilst the clavicles, scapulae and radii were somewhat better preserved. The head rested on a raised brick shelf, while the body lay on a nearly decomposed plank. Beside the body lay a sword, lance, helmet, spears, a gold clasp and a gold ring, together with a Greek cross of the same metal, inlaid with nine precious stones, two gilt bronze crosses, a small flask with water, which was still remarkably clear, and a piece of a very beautiful fabric interwoven with gold tissue-threads. At first no clue could be obtained as to the name or time with which these remains could be associated, but the subsequent removal of the clay deposited at the bottom of the grave has brought to light the letters GISVI, and hence it is conjectured that in this sarcophagus have been discovered the remains of Gisulf, Duke of the Lombard Marches of Friuli, who fell in battle in 611, while fighting to defend his territories from the invasion of the Avars.

THE STAGE.

"LED ASTRAY" AT THE GAIETY.

It is not quite fully known to the public that there have been three Mr. Boucicaults. The first was a smart and studious writer of comedy. To our audiences of thirty years ago, he gave *London Assurance* and *Old Heads and Young Hearts*. Soon afterwards he disappeared, and no one offered a reward for his recovery, which, upon the whole, was a mistake. But the name was not destined to die. At a time when the fortunes of legitimate drama were at their lowest, and when one excellent Shaksperian actor felt it to be more in accordance with his feelings to go and keep a tobacconist's shop at Stratford-on-Avon than to appear on the stage of the sensational theatres—and so actually did so—there arose another writer of the name of Boucicault: a man fully competent to supply the playgoing public with the intellectual food it liked just then; and he wrote two more or less stirring dramas of Irish life: the *Colleen Bawn* and *Arrah na Pogue*. He also disappeared, though no one heard that anything had "happened" to him. But in good time there arose yet another of his name—an adroit writer, who made an intimate alliance with the machinist and the "property man;" and he brought out *Basil and Bijou*: a spectacle which grown-up children went to see at Covent Garden, on the excuse of taking there such children as were not grown up. To which of the three Mr. Boucicaults are we to assign the authorship of *Led Astray*?—a play which, having been very successful in America, was brought out here in London at the Gaiety Theatre on Wednesday night. There are certain bits of the dialogue; but they are very few, which remind us of the dramatist who wrote *London Assurance*.

There is little to recall the other two Boucicaults; and on the whole we are inclined to surmise that the writer of *Led Astray* has been inclined to follow in the steps of the first of his name, but has found himself dealing with a theme in which if dialogue counted for something, situation counted for more.

Led Astray is founded on a work of Octave Feuillet's; and *La Tentation*—the French name for it—indicates, far better than does the English title, the course of the story. Armande, the heroine, though tempted, is never guilty. She is always on the brink of a precipice and always turns back from it in time; until in the sixth act, having been partly the cause of a duel in which a foolish lover actually shot her husband (who providentially recovered), she takes to a quiet life; finds her husband as good as other people; and settles down to a fair substitute for happiness—the consolation of wool work and an easy chair. The husband appears to have been a very careless, useless person, who has married Armande—like a good many others—without quite knowing why. But he loves very tenderly his daughter, by a former wife; he has mercy enough to spare the rhapsodical fool—a yearning gentleman, who makes for Armande his best love and his worst verses—mercy enough, I say, to give this poor poet his life, which must be a misfortune for literature; and eventually, the good side of his character having come out, he is persuaded through the influence of his daughter to leave his arm-chair on one side of the stage and to approach his wife's which is on the other: and so at last there is a touching reconciliation between the occupants of the widely divided arm-chairs, and the curtain falls upon a re-united family and a satisfied audience.

The story is told at too great length. It drags very much in the earlier scenes, and elsewhere it is narrated with too much of circumstance—the duel, for instance, is presented with an amount of detail which, from a sensational point of view, is effective enough, but which is too repulsive to be in the least artistic. And, by the bye, in this duel scene one of the characters who has previously been individual, reminds us too forcibly of Sir Lucius O'Tigger. Major O'Hara, with his valorous indifference to the danger of other people, is Sir Lucius urging on Bob Acres to the fight. Of course he is amusing, but he is too plainly the result of a reminiscence. The Major, in other scenes, is a fairly presentable stage-character, and he is represented with excellent judgment and effect by Mr. Belford, whose acting is almost the only acting in the piece that is not open to any objection. It is frank, genial, plausible; there is no obvious *finesse* in it, but a performance of an Irish adventurer is none the worse for that.

The two American comedians—one of them is a comic actor; the other, in a higher sense, endeavours to be a comedian—are peculiarly unequal. It is difficult to judge them as we judge English actors with whose methods we are familiar. They so often surprise us (and specially Mr. Charles Thorne, who plays the husband) with bad moments when we are expecting good, and then again, good when we are confidently expecting bad. Mr. Thorne has a face which can express a good deal of strong and genial feeling, and he has some dramatic movements, and he is at all times intelligent—though to English ears it does not sound so when one hears the stilted over-complimentary, over-serious tone with which he utters commonplace phrases,—"Madame is unwell," for example. But perhaps the main deficiency in his performance of the part of Rodolphe Chandoce, the husband, a young Norman noble, is that, except in the quite serious passages, where a certain natural dignity rises to the surface, there is a lack of distinction about his personation of the character. And, indeed, almost throughout the cast, you notice the same lack of personal distinction. Many of the *dramatis personae* live in the best society. But, without any crying fault,

any one special offence, you feel that this is hardly the company it claims to be: there is a want of grace, dignity, social ease. There are some exceptions, certainly. Miss Helen Barry has the dignity, and Miss Amy Roselle has the ease. But among the others it is difficult to find either. Even Mr. Edmund Leathes, who behaves very well in the duel scene, does not press his suit upon Armande with anything of the fervour of conviction. It is difficult to him to declare himself, except at one given moment, when the declaration, or what is tantamount to it, is given even too trippingly. But his part is a very poor one, and never worse than at the instant when finding Armande weeping over her husband's indifference to her, he suggests his desire to "mingle my tears with yours"—in other words, to go about with her a little, in railway carriages and among foreign inns.

Mr. Charles Robson has an American accent much too strong to be ignored. He has of course an American intonation, beside, but these things do not appreciably mar—sometimes I think they aid—the presentation of a character which is entirely cool, shrewd, keen, and matter-of-fact: he is the guardian spirit of the story: his cool goodwill and clear-sighted persistency keep other people straight. Mr. Robson acts with watchful care and a good deal of dry comic power. Miss Helen Barry's part—that of Armande—is of the highest importance. She looks the character well, and has found several speaking gestures and several pregnant tones. But her experience in parts of the importance of this one is hardly sufficiently great to enable her to present with the countless touches of detail the character and life of a woman suffering and tried and tempted like Armande. Miss Amy Roselle has nothing of any moment to do until the last act, when, if we may judge by the applause that follows it, she takes the audience a little by surprise, with a scene of convent-school-girl awkwardness about her love-affair, and this is acted with discretion, which is much, and with very genuine humour, which is more. The remaining characters are acted by Mr. Temple, Mrs. Howard, Miss Le Thiere and Miss Baldwin. It is a small fault of the drama that one of these, which might have been amusing, runs to earth quite early in the evening; and that is the "fashionable adventurer," who threatens at one time to be fascinating. Like the other "temptation" of the piece, she is prudently got out of the way.

FREDERICK WEDMORE.

THE statement that Mr. W. B. Donne is going to resign his important post—which is practically that of licenser—in the Lord Chamberlain's office, is again repeated, and things have gone so far that the name of an accomplished actor, now retired from his profession, has been mentioned for the work. A more appropriate appointment would surely be that of a conscientious and sagacious writer—such a man as Dr. Westland Marston, ought at all events to have the offer of the post.

MANY English readers, who admired Mdlle. Desclée, and held her to be generally accepted as the finest actress since Rachel, would be astonished if they knew how insignificant was the money reward of her success. Desclée, instead of being in receipt of the fortune with which her friends credited her, never, we believe, was paid more than five hundred a year. The only savings she was ever able to effect—notwithstanding the simplicity of a life led on the third story of an unfashionable boulevard—were the moneys that came to her during the last year of her life, owing to her success in London and Brussels. In Paris there is hardly an actress, except at the Théâtre Français, who is enabled to make any large income by the exercise of her art; and it is only of late years that engagements at the Français, or membership there (which is quite a different thing), has proved really remunerative. Nothing but the increased vogue of the theatre has enabled it to distribute

largely of its profits. The men and women now there find the theatre a profession that pays; but he who was perhaps the greatest comedian of recent times—Samson, who died an old man, two years ago, broken down at the failure of the French arms—was never able to grow rich, for all his forty years at the theatre, where, early, he had instructed Rachel, and late, had seen the *début* of Croizette.

Better Late than Never, a comic drama of French origin, adapted for the English stage by Mr. F. C. Burnand, was produced a few nights ago at the little theatre in Dean Street.

THE important part of Lady Alice in Mr. Boucicault's comedy, *Old Heads and Young Hearts*, at the Vaudeville Theatre, is now played by Miss Furtado. Miss Amy Roselle, who has gone to the Gaiety, returns to the Vaudeville in the autumn, it is announced.

THE managers of the French plays at the Princess's have been, through new objections of the licensing authorities, again obliged to have recourse to somewhat old-fashioned pieces, or amusing pieces like the *Reveillon*, which most people have now seen. These pieces for the most part are admirably played; Messrs. Didier and Schey and Mdlle. Davenay continuing to distinguish themselves. But the position into which the managers are driven is none the less an irritating one.

ELSEWHERE than at the Princess's Theatre, July is to be a great time for the French plays in London. To-night the company from the corner of the Chaussée d'Antin make their first appearance here as a complete body. The place will be the Queen's Theatre, and the piece, Sardou's *Oncle Sam*. On and after Monday next, the St. James's Theatre will be devoted to the French classical drama, supported by Mdlle. Agar, and a troop of assistants from several good Paris theatres.

M. FRANCISQUE SARCEY has written, in *Le Temps*, the first of two articles on those dramatic notices by Jules Janin, one of which was published in the *Débats* every Monday for forty years; and the articles of M. Sarcey are something quite different from the praises which have been so much lavished on the fashionable dramatic critic. M. Sarcey's first article, like all that comes from his pen, has the merit of entire frankness. Without being ill-natured, it is distinctly severe. It is analytical, keen, and searching, and it is a very creditable thing for Paris that it is this criticism of M. Sarcey's which has succeeded to the favour so long enjoyed by Janin himself. At first it may seem want of taste for one dramatic critic to sit in judgment upon the work of another; but the time had really come for saying some things plainly, and it was impossible that a man whose greatest mastery was a mastery of the art of how to say nothing in a ceaseless stream of prose, should any longer be accepted as the most powerful representative of French criticism during forty years of more or less brilliant French literature and art. M. Sarcey never knew Janin personally: he had seen only at a distance (save once, for a quarter of an hour) the honest face and the clear look, and had heard only at a distance the sonorous laugh which was so familiar to most Parisian journalists. He avers that for fifteen years out of the forty, Jules Janin wrote well: criticised well. "And think," he exclaims, "how much that means—to write well a weekly criticism, for fifteen years!" But the rest of the time he lived on an old reputation—reputation, too, acquired in chief more by new manner than new matter—and it was only indulgence that allowed him to exercise from an arm-chair at Passy the influence which, to wield aright, a critic must exercise from his stall in a theatre. Jules Janin was not (as in other words M. Sarcey is most right in saying) a great dramatic critic. You cannot think of him with Hazlitt, Lamb, Leigh Hunt. He was an honest man who had invented a new way of saying commonplace things.

MDLLE. BLANCHE D'ANTIGNY, the French actress, is dead. She was born in 1842, and had her best success at the Théâtre des Folies Dramatiques, where she appeared in *Chilpéric* and *Le Petit Faust*, of Hervé. Afterwards she was at the Palais Royal, and at the Menus Plaisirs; and though she did not improve in her art, she did not very perceptibly decline in popularity. The French admired her at Alexandria; where the Italian colony—critical in a different direction—did not approve of her voice. Those who met Mdlle. d'Antigny in private life, speak of her very pleasantly. She leaves many friends who had benefited by her kindnesses.

IN Paul Szilagy, whose death on June 20 is recorded, the Hungarians have lost not only one of their best actors, but one of the most influential of the founders of the national drama of Hungary. Under the title of *Tales of a Grandfather*, Szilagy wrote a few years ago a history of the rise and development of Hungarian dramatic art. Although he retired from the stage in 1868, when his daughter, the Dresden *prima donna*, Mdlle. Lila Buljovszky, acted with him at his farewell benefit, he continued to the last to take an active interest in the management of the Pesth theatre, with which he had so many years been connected.

MUSIC.

THE HANDEL FESTIVAL—"ISRAEL IN EGYPT."

BEFORE proceeding to speak of the concluding day of the Handel Festival, we wish to rectify an omission in our notice of the Selection. In speak of the solo performances, we left unmentioned one of the finest—Signor Agnesi's rendering of the song "Revenge, Timotheus cries," from *Alexander's Feast*, and, lest the omission should be thought intentional, record the fact now.

The very fine performance of *Israel*, which brought the festival to a close yesterday week, confirmed our previous opinion that it is, of all Handel's oratorios, the one which at the Crystal Palace is heard to the greatest advantage. This arises partly from the large predominance of choral writing—twenty-eight of the thirty-nine numbers of which it consists being choruses—and partly from the fact that the double choruses which form so important a feature in the work are heard in that enormous orchestra, where the two choirs are really at a considerable distance from one another with an antiphonal effect which is realised nowhere else. Handel probably took the idea of the double chorus from Carissimi, (in whose oratorio *Jonas* are to be found examples of its use), with whose music the old Saxon was doubtless acquainted, as he in more than one instance borrowed from him as he did from every one else. But Handel used the double chorus with a freedom and a power previously unknown. He first tried the experiment in an imperfect manner in the chorus "Day by day" of the *Utrecht Te Deum*; but it was in his second oratorio, *Deborah*, that in the chorus "Immortal Lord," and still more in the wonderfully dramatic movement, "All your boast will end in woe," he showed what effects could be produced by this means. It is a curious thing that (excluding the *Occasional Oratorio*, into which a few of the double choruses from *Israel* are transferred), *Solomon* is the only one of all Handel's later oratorios in which the double chorus is used at all. It seems probable that the comparative failure of *Israel* on its first production discouraged the composer, and induced him to confine himself to the simpler form of chorus to which his audiences were accustomed.

It is well known that Handel was by no means scrupulous as to appropriating the ideas of other composers; and, excepting the *Dettingen Te Deum*, there is perhaps no work in which are to be found more "stolen goods" than *Israel in Egypt*. Space forbids our entering into details on this subject; it must suffice to say that seven movements of the

present oratorio, are founded more or less on themes from Erba's "Magnificat," and four others on subjects from a serenata by Stradella; while the chorus "Egypt was glad" is nothing but an organ-piece by Kerl, arranged with very trifling alterations, for voices. The original of this last-named piece may be found by those interested in the subject in Hawkins's *History of Music*.

The performance at the Crystal Palace, like that of the *Messiah* on the previous Monday, was on the whole of remarkable excellence. Never have we heard the difficult chromatic passages of the chorus "They loathed to drink of the river," or the involved combinations of "He led them through the deep," sung with more precision. There are one or two pieces, however, at which a chorus is almost sure to stumble, and the intonation in parts of "And with the blast of thy nostrils" and "The people shall hear," certainly left something to desire; still, taken altogether, the choruses went magnificently. The "Hailstone" chorus (encored, as usual) and "The horse and his rider" could not have been finer. We should have said the same of "Thy right hand, O Lord," but that its abrupt close—one of Handel's most dramatic effects at the words "hath dashed in pieces the enemy"—was utterly ruined by the conductor's absurd addition of three notes. We shall not, however, dwell on this unpleasant point, on which we expressed our opinion last week, further than to say that a few of the alterations made in *Israel* surpassed (if possible) in bad taste those which were noticeable at the Selection.

The solo music of *Israel*, though comparatively small in quantity, is by no means unimportant in quality. It could hardly have been better rendered than on this occasion. Mr. Sims Reeves was fortunately able to sing, and gave "The enemy said" as no one but he can give it, though we could willingly have dispensed with the "high A" at the end. Until public taste is so far elevated that a high note will no longer "bring down the house," it seems a useless task—a mere crying in the wilderness—to protest against it. Mdlle. Otto-Alvsleben, a singer whose high abilities have hardly received their full recognition in this country, gave great effect to the air "Thou didst blow," though she too spoilt the close by transposing it an octave higher than written. She also joined Mdlle. Lemmens-Sherrington in the duet "The Lord is my strength," and the latter lady's fine voice was heard to advantage in the short solos which introduce the final chorus. Mdlle. Patey sang "Their land brought forth frogs" and (with Mr. Kerr Gedge) the duet "Thou in thy mercy." Mr. Gedge also gave the two recitatives in the first part of the oratorio. Lastly, the duet, "The Lord is a man of war," was given by Mr. Santley and Signor Foli with such effect as to obtain an encore.

In reviewing generally the festival now past, the first recognition is certainly due to Sir Michael Costa. Whatever differences of opinion may exist as to his good taste, there can be no doubt as to his consummate ability as conductor of a large force, and as to his power to make the music "go." For such occasions as the Handel Festival it would be difficult to replace him. A word of mention should also be given to Mr. Willing, the organist of the Sacred Harmonic Society, who presided at the organ, for the unvarying good taste and discretion showed in his accompaniments. The general arrangements, under the management of the officers of the Crystal Palace, and the committee of the Sacred Harmonic Society, were most admirable; and a special word of thanks is due from members of the press to Mr. Shenton, who had the charge of the press-gallery, for his efforts to promote their comfort. The whole festival, in a musical point of view, may be justly considered one of the most successful of all which have as yet taken place. EBENEZER PROUT.

THE seventh Philharmonic concert of the present series, which was given last Monday evening,

included more than one feature of interest. First in importance was the production (for the first time by this society) of Brahms's charming serenade, Op. 16, in A, for small orchestra. If we are not mistaken, the work had only been previously heard in this country at the concerts given last year under Mr. Barnby at the Albert Hall, in connexion with the International Exhibition. Taken as a whole, it is one of the best, and certainly one of the most attractive of Brahms's compositions. It is not only far less diffuse, but more original than his earlier Serenade in D, Op. 11, for full orchestra. The absence of violins, and the consequent prominence given to the wood instruments, imparts a peculiar tone-colouring to the orchestration, which, with less tact than Brahms has shown, would easily have become monotonous. Of the five movements of which the work consists, the opening *allegro* and the quaint and graceful *quasi menuetto* are perhaps the finest; though the second movement, *ascherzo*, pleased so much from its piquant (somewhat Beethovenish) rhythms as to obtain an encore. The slow movement is as a whole rather too long, though containing some most exquisite subjects; and the final *rondo*, though its first phrases are not very original, contains a "second subject," given in the first instance to the oboe, which is one of the freshest and most charming themes in existence. With the exception of one or two slight slips in the wind instruments, the work was given to perfection; and the performance of the unfamiliar music was such as to reflect the greatest credit both on the band and on the conductor, Mr. Cusins. Another specialty of this concert was Madame Essipoff's superb playing of Mendelssohn's Concerto in G minor. Her reading is characterised by strong individuality and great musical feeling, and the enthusiasm it aroused was such as is not often seen at a Philharmonic concert. Not less successful was the fair pianist in her group of solos, by Bach, Schubert, and Chopin, in the second part. The rest of the programme included Beethoven's Symphony in B flat, Sullivan's clever overture to *Marmion*, the *Zauberflöte* overture, and vocal music (which was by no means remarkable for novelty) by Miss Edith Wynne and Madame Bentham-Fernandes.

It is no small thing for a concert-giver to be able to crowd such an enormous building as the Albert Hall to the doors; yet this feat was accomplished by Mr. Sims Reeves at his benefit concert last Monday evening. No doubt the general desire to express sympathy with our great tenor on account of his recent illness had something to do with this; but Mr. Reeves's name of itself will draw an audience as probably no other name in this country will do. Mr. Reeves, who was in his best voice, selected as the chief novelty of his performance Balfe's "Rose Song" from *Il Talismano*, which was originally composed for him, and which was given on this occasion for the first time in English. We have only room to add that Mr. Reeves was assisted by Mme. Christine Nilsson, Madame Lemmens-Sherrington, Mme. Trebelli-Bettini, Miss Helen d'Alton, Mr. Santley, Mme. Norman-Néruda and Mr. William Coenen. The Royal Albert Hall Choral Society, conducted by Mr. Barnby, also sang some part-music. Dr. Stainer was at the organ, and Messrs. Blumenthal, Sidney Naylor, and Hatton at the piano.

MR. W. GANZ's annual benefit concert took place at St. James's Hall, on Monday afternoon, before a very large audience; and, with the assistance of Mdles. d'Angeri, Scalchi, and Albani, Mme. Liebhart, Misses Edith Wynne and Alice Fairman, Signori Marini, Gardoni, Graziani, and Foli, and Messrs. Santley and Trelawny Cobham as vocalists, and Mme. Essipoff, Mdle. Marie Krebs, Sir Julius Benedict, Signori Papini and Randegger, M. Paque and Mr. Cowen in the instrumental department. The performances were such as might be expected from so distinguished artists; among the most successful may be named

Kullak's duet for two pianos on *L'Etoile du Nord*, excellently played by Mme. Essipoff and Mr. Ganz; the brilliant performance by Mdle. Krebs, Sir Julius Benedict, Mr. Cowen and Mr. Ganz, of Benedict's eight-handed arrangement of his own Andante and Chopin's posthumous mazurka; Mr. Santley's fine singing of the "Maid of Athens" (encored), and Mdle. Angeri's beautiful delivery of Gounod's "Ave Maria," accompanied by Signor Papini, Signor Randegger, and Sir Julius Benedict.

MDME. ADELINA PATTI announces a grand concert at the Royal Italian Opera, on the 16th instant, for the benefit of the "Mozarteum" at Salzburg, at which she will be assisted by the artists of Mr. Gye's company. Mdle. Krebs, we understand, is also engaged to take part in it. The programme will be entirely selected from the works of Mozart.

MR. HULLAH's Report for 1873 on the Musical Examinations he has conducted in the Training Schools of Great Britain has just been published. It is gratifying to learn from the Inspector that the results, "if not yet satisfactory, are encouraging, and show a considerably increased amount of skill in practical music on the part of the students to whom they refer." Mr. Hullah considers that the frequent instances of failure are largely due to the fact that in the majority of cases the students, during their previous career as pupil-teachers, had not even received the most elementary musical instruction. The whole report is full of interest, and we commend it to the attention of our readers.

JOHANN STRAUSS has returned from his very profitable concert tour in Italy to Gratz. He has purchased a residence in Florence of the value of 100,000 florins, and intends to pass the winter partly there, partly in Gratz, and only occasionally in Vienna.

POSTSCRIPT.

THE DECORATION OF ST. PAUL'S.

SINCE we first expressed our judgment, four weeks ago, upon the scheme for the decoration of St. Paul's as represented in Mr. Burges' model, the several organs of public opinion have followed suit with a very remarkable unanimity upon the subject. The *Times*, the *Pall Mall Gazette*, *Punch*, the *Guardian*, the *Spectator*, the *Daily Telegraph*, the *Record*, have all from different points of view expressed in strong terms their disapproval of the plan which has received the assent of the Committee. The *Saturday Review* is the only organ which supports the scheme, and in doing so it appears to have assumed the position of an advocate with instructions of the most intimate character, and has in more than one instance revealed to the public details of the scheme which were previously unknown, as it appears, even to members of the Committee. The decoration of St. Paul's is an undertaking which obviously depends upon the unanimous support of the public for its completion, and which must be a lamentable failure unless it is an undoubted success. The Committee will be unwise to commit themselves to any scheme unless they can feel a moral certainty of its ultimate accomplishment, and will, therefore, have to consider seriously whether it is either possible to complete, or justifiable to commence, a work which is opposed by the unanimous verdict of public opinion.

MESSRS. LONGMANS announce that the Alpine Club map of Switzerland and the adjacent countries will be ready on August 1. Three essays on religion, entitled "Nature," "The Utility of Religion," and "Theism," by the late John Stuart Mill, will be published in October next; and in September will appear *The Life of John Holland, of Sheffield Park*, edited by William Hudson, from numerous letters and other documents furnished by his nephew and executor, John Holland Brammall.

THE *Temps* understands that M. Viollet-le-Duc has given in his resignation as Inspector-General of Diocesan Buildings, owing to a political misunderstanding with the Minister of Public Instruction and Worship.

A most important literary relic of John Stow, author of the famous *Survey of London*, has, according to the *City Press*, been just discovered by Messrs. Puttick and Simpson. It consists of a volume containing a transcript of *John Lydgate's Chronicles*, comprising 570 pages in the autograph of Stow. On the last leaf occurs this sentence:—"This boke perteynythe to John Stowe, and was by hym wryten in ye yere of our Lord m.d.lviij." It is only reasonable to assume that Stow required a copy of *Lydgate's Chronicles* for the purpose of compiling his own work, and, being too poor to purchase one, set himself the laborious task of transcribing the whole. John Stow, according to Rich, lived to beg his daily bread in his eightieth year, and died 1605.

SOME of the American papers state that Professor Huxley is likely to be the successor of Professor Agassiz, at Harvard. We hope there is no truth in this. Are the English Universities so rich in really eminent professors, and so poor in money, that they can or must allow Professor Huxley to go to America in order to find leisure for work? It would require nothing but the will for either Oxford or Cambridge to offer Huxley two or three thousand a year without anybody suffering for it. There are hundreds of non-resident fellows, doing no good to the University, doing harm to themselves in resting on their oars, when they ought to be pulling with all their might. Why not give five or ten such fellowships to men like Huxley, and make the Universities again what they were in the middle ages, the very centres of intellectual force and light in the country? The Universities are so rich that they could beggar the whole world. Will they allow themselves to be beggared by Harvard?

TABLE OF CONTENTS.

TRÜBNER & CO.'S NEW PUBLICATIONS.

HENRY BEYLE (otherwise De Stendahl). A Critical and Biographical Study, aided by Original Documents and Unpublished Letters from the Private Papers of the Family of Beyle. By **ANDREW ARCHIBALD PATON**. Crown 8vo. pp. 340, cloth, 7s. 6d.
"A book which is sure to be widely read."—*Standard*.

THE HONEYMOON: Remembrance of a Bridal Tour through Scotland. By the **COUNT DE MEDINA POMAR**. In 2 vols, crown 8vo, cloth, 21s.

THREADING MY WAY: Twenty-Seven Years of Autobiography. By **ROBERT DALE OWEN**. Crown 8vo, pp. 344, cloth, 7s. 6d.

PROBLEMS of LIFE and MIND. By **GEORGE HENRY LEWES**. First Series: "The Foundations of a Creed." Vol. I. Second Edition. Demy 8vo, pp. 488, cloth, 12s.

THE CREED of CHRISTENDOM: Its Foundations contrasted with its Superstructure. By **W. R. GREG**. Third Edition. With a New Introduction. Two Vols., crown 8vo, pp. 272 and 290, cloth, 15s.

ENIGMAS of LIFE. By **W. R. GREG**. Sixth Edition. Crown 8vo, pp. xxi+308, cloth, 10s. 6d.

THE DEVELOPMENT of CREATION on the **EARTH**. By **T. L. STRANGE**. Demy 8vo, pp. 122, cloth, 2s. 6d. [Now ready.]

THE LEGENDS of the OLD TESTAMENT Traced to their apparent Primitive Sources. By **T. L. STRANGE**. Demy 8vo, pp. 256, cloth, 6s. [Now ready.]

SPANISH REFORMERS of TWO CENTURIES, from 1520: their Lives and Writings, according to the late **B. B. WIFFEN's** Plan, and with the use of his Materials. Described by **E. BOEHMER**, D.D., Ph.D. Vol. I., with Narrative of the Incidents attendant upon the Republication of "Reformistas Antiguos Españoles," and a Memoir of **B. B. WIFFEN** by **ISALINE WIFFEN**. Royal 8vo, pp. 232, Roxburghe, 15s.; cloth, 12s. 6d.

THE HISTORY of INDIA, from the Earliest Ages. By **J. TALBOYS WHEELER**, Secretary to the Chief Commissioner of British Burma. Vol. III. Hindu, Buddhist, Brahmanical Revival. Demy 8vo, pp. 624, with 2 maps, cloth, 18s.
The above volume forms also a complete work in itself, and may be had with separate title, as "The History of India: Hindu, Buddhist, and Brahmanical."

TRAVELS in INDIA in the SEVENTEENTH CENTURY. By **Sir THOMAS ROE** and **Dr. J. FRYER**. Demy 8vo, pp. 478, cloth, 7s. 6d.

A PERSIAN-ENGLISH and ENGLISH-PERSIAN DICTIONARY. By **E. H. PALMER**, M.A., Professor of Arabic at the University of Cambridge. [In the press.]

COMPENDIUM of the COMPARATIVE GRAMMAR of the INDO-EUROPEAN LANGUAGES, so far as it relates to the Sanskrit, Greek, and Latin. By **AUGUST SCHLEICHER**. Translated, from the Third German Edition, by **HERBERT BENDALL**, B.A., Chr. Coll. Camb. [Shortly.]

THE DATHAVANSA; or, the History of the Tooth Relic of **GOTAMA BUDDHA**. The Pali Text, and its Translation into English, with Notes. By **MUTU COOMARA SWAMY**, Madeliar. Demy 8vo, pp. 174, cloth, 10s. 6d.

English Translation, with Notes, 6s.

SUTTA NIPATA; or, the Dialogues and Discourses of **GOTAMA BUDDHA** (2,500 years old). Translated from the original Pali, with Notes and Introduction, by **MUTU COOMARA SWAMY**, Madeliar. Crown 8vo. [Shortly.]

HOEI SCHEIN; or, the Discovery of America by Buddhist Monks in the Fifth Century. From the Chinese by **CARL F. NEUMANN**, late Professor of Oriental Languages and History at the University of Munich. Translated, under revision of the Author, by **CHARLES G. LELAND**. [In preparation.]

HEBREW THEISM: the Common Basis of Judaism, Christianity, and Mohammedanism, with revisions to the quarto Edition of 1858. By **Francis W. NEWMAN**. Royal 8vo, pp. 184, stiff wrappers, 4s. 6d.

THE WORKING CLASSES. By **CHARLES LAMPART**, F.R.S. Reprinted from the *Westminster Review* for January, 1874. Demy 8vo, pp. 40, sewed, 1s.

THE ENGLISH LANGUAGE Spelled as Pronounced, with enlarged Alphabet of Forty Letters, a Letter for each Distinct Element in the Language. With specimens. By **GEORGE WITHERS**. Royal 8vo, pp. 84, sewed, 1s.

London: TRÜBNER & Co., 57 and 59 Ludgate Hill.

NEW BOOKS

PUBLISHED BY

JAMES PARKER & CO.

A MEMOIR of the Rev. JOHN KEBLE, M.A., late Vicar of Hursley. By the Right Hon. Sir J. T. COLERIDGE, D.C.L. Fourth and Cheaper Edition, post 8vo, cloth, 6s.

HYMNS from the BREVIARY. By the late Rev. ISAAC WILLIAMS. HYMNS FROM THE PARISIAN BREVIARY. 32mo, cloth, 2s. 6d. [Ready.]

LENTEN SERMONS. Preached chiefly to Young Men at the Universities, between A.D. 1858-1874. By the Rev. E. B. PUSEY, D.D., Regius Professor of Hebrew, and Canon of Christ Church. 8vo, cloth, 6s.

THE TWO BLASPHEMIES: Five Sermons on the Blasphemy against the Son of Man which shall be forgiven, and the Blasphemy against the Holy Ghost which shall not be forgiven; preached before the University of Oxford. By **HENRY HARRIS**, B.D., Rector of Winterbourne Bassett, Wilts, and late Fellow and Tutor of Magdalen College, Oxford. Crown 8vo, limp cloth, 3s. 6d.

ECLIPSES, PAST and FUTURE; with General Hints for Observing the Heavens. By the Rev. S. J. JOHNSON, M.A., F.R.A.S., Rector of Upton-Hellon, Devon. Crown 8vo, illustrated with a Diagram of the Transit of Venus visible in Great Britain in 1882, limp cloth, 4s.

SAYINGS ASCRIBED to OUR LORD by the FATHERS and other PRIMITIVE WRITERS, and Incidents in His Life narrated by them, otherwise than found in Scripture. By **JOHN THEODORE DODD**, B.A., late Junior Student of Christ Church. Fcp. 8vo, cloth, 3s.

FOUR LECTURES on the CLERGY and THEIR DUTIES. Addressed to the Unattached Students of the University of OXFORD. By the Right Reverend the BISHOP SUFFRAGAN of NOTTINGHAM, D.D. Fcp. 8vo, limp cloth, 2s.

APOLLOS; or, the Way of God. A Plea for the Religion of Scripture. By **A. CLEVELAND COXE**, Bishop of Western New York. Crown 8vo, cloth, 5s.

THE PASTORAL RULE of ST. GREGORY. Sancti Gregorii Pape Pastoralis Liber ad Johannem Episcopum Civitatis Ravennae. With an English Translation by the Rev. H. R. BRAMLEY, M.A., Fellow of Magdalen College, Oxford. Fcp. 8vo, cloth, 6s.

"As a present for a clergyman none could be better. We trust that all who read it may learn to reverence St. Gregory, its saintly author, more and more praising God for having given to the Church of England such a truly 'golden volume.'"—*Church Herald*.
"A literal but spirited translation of St. Gregory's great work from the Benedictine text."—*Standard*.

A COMMENTARY on the EPISTLES and GOSPELS in the BOOK of COMMON PRAYER. Extracted from Writings of the Fathers of the Holy Catholic Church, anterior to the Division of the East and West. By **A LAY MEMBER of the CHURCH**. With an Introductory Notice by the DEAN of ST. PAUL'S. In Four Parts. Part I. Advent-Quinquagesima. Crown 8vo, paper covers, 3s.

OXFORD AND LONDON: JAMES PARKER & CO.

Just published, in crown 8vo, cloth, price 3s. 6d.

LECTURES ON THE HISTORY OF EDUCATION

In PRUSSIA and ENGLAND, and on Kindred Topics.

By **JAMES DONALDSON**, LL.D., Rector of the High School of Edinburgh.

Edinburgh: A. & C. BLACK. London: LONGMANS.

THE PAPER which Mr. ALEXANDER J. ELLIS, F.R.S. (Author of "Early English Pronunciation"), recently read before the College of Preceptors, on the "QUANTITATIVE PRONUNCIATION OF LATIN" (reported in the ACADEMY for June 20, p. 696), having been rearranged, is now at press, and will be shortly published by Messrs. MACMILLAN & Co., in connexion with the present movement for improving our Latin Pronunciation.

In addition to an elaborate argument for establishing his views on the function of final M in Latin, Mr. Ellis gives a complete graduated course of instruction to enable teachers (who adopt the Syllabus of Latin Pronunciation drawn up by Professors Palmer and Munro) to lead their pupils to a full conception of the quantitative and accentual rhythm of Latin verse and prose in the Augustan Period. The book will thus form a manual for the teacher as well as a treatise for the scholar on a subject hitherto much neglected, because it could not have possibly made a part of regular school instruction so long as our old barbaric pronunciation of the vowels was retained.

THE EDINBURGH REVIEW, No. 285, will be published on SATURDAY, July 18th. ADVERTISEMENTS intended for insertion cannot be received by the Publishers later than MONDAY, July 13th.

London: LONGMANS & Co., 39 Paternoster Row, E.C.

THE ALPINE CLUB MAP OF SWITZERLAND.

On August 1, in FOUR SHEETS, price 2l. 2s., or separately price 12s. each Sheet.

MAP of SWITZERLAND and the ADJACENT COUNTRIES, on the Scale of Four Miles to the Inch, from Schaffhausen on the North to the Southern Slopes of the Val d'Aoste and Milan on the South, and from the Ortler Group on the East to Geneva on the West. Constructed under the immediate superintendence of the ALPINE CLUB, and edited by R. C. NICHOLS, F.S.A. F.R.G.S.

SHEET I. Basel, Luzern, Interlachen, Bern, Fribourg, and Neuchâtel.

SHEET II. Constanz, Zurich, Chur, and Landeck.

SHEET III. Geneva, Brieg, Aosta, Jura, and Mont Blanc.

SHEET IV. Splügen, Ortler Sp. Adamello, Son'rio, Como, and Milan.

* * The whole will be published on August 1, Sheets I. II. and III. complete, and Sheet IV. with outline and lettering only; but when the engraving of the hills on Sheet IV. is completed, proofs of that sheet will be exchanged for the lettered copies.

London: LONGMANS & Co., Paternoster Row; and

E. STANSFORD, Charing Cross.
Edinburgh: W. & A. K. JOHNSTON.

A FEW PAGES from REAL LIFE. By Mrs. BERNAL OSBORNE. 2 vols. crown 8vo, 16s.

PRAIRIE and FOREST: a Description of the Game of North America, with Personal Adventures in their Pursuit. By **PARKER GILLMORE**, "Ubique," Author of "Gun, Rod, and Saddle," &c. Demy 8vo, with numerous Illustrations, price 12s.

THROUGH FANTEE-LAND to COOMASSIE. A Diary of the Ashantee Expedition. By **FREDERICK BOYLE**, Author of "Camp Notes," &c., Special Correspondent to the *Daily Telegraph*. Post 8vo, 14s.

CHAPMAN & HALL, 133 PICCADILLY.

BOOKS FOR SUMMER READING.

Now ready, in 1 vol. crown 8vo, price 9s.

WORDSWORTH'S TOUR IN SCOTLAND

IN 1803,

In COMPANY with his SISTER and S. T. COLERIDGE;

Being the JOURNAL of Miss WORDSWORTH, now for the first time made public.

Edited by Principal SHAIPE, LL.D.

"If there were no other record of her than those brief extracts from her Journal during the Highland Tour, which stand at the head of several of her brother's poems, these alone would prove her possessed of a large portion of his genius. Larger extracts from them occur in the poet's biography and in the edition of the Poems of 1867, and often they seem nearly as good as the poems they introduce. Might not that wonderful Journal even yet be given entire, or nearly so, to the world?"—*North British Review*.

Now ready, 1 vol. crown 8vo, price 8s. 6d.

SCOTTISH RIVERS.

By the late **Sir THOMAS DICK LAUDER**, Bart., Author of "The Morayshire Floes," "The Wolf of Badenoch," &c. With three Etchings from Sketches by the Author, and a Preface by **JOHN BROWN**, M.D., LL.D., Author of "Rab and his Friends," &c.

EDMONSTON & DOUGLAS, 88 Prince's Street, Edinburgh.

MR. NICHOLAS MICHELL'S NEW POEM.

Now ready, fcp. 8vo, 3s. 6d. cloth.

THE HEARTS GREAT RULERS. By **NICHOLAS MICHELL**, Author of "Ruins of Many Lands," "Pleasure," &c.

The Passions are illustrated by the following Tales:—
Pleasure's Devotee. Forbidden Love; or, the Lady
The Miser of Bethnal Green. and the Priest of Rome.
The Gambler's Last Stake. Jealousy. Love unto Death.

London: SAMPSON LOW, MARSTON & Co., 188 Fleet Street.

In large crown 8vo, price 18s. cloth, 1,100 pages, New Edition.

THE MANUAL of DATES. A Dictionary of Reference to the most Important Events in the History of Mankind to be found in authentic Records. By **GEORGE TOWNSEND**.

"As a Dictionary of References, it merits the highest commendations for the care and accuracy with which the many thousands of facts which it contains have been compiled."—*Observer*.

FREDERICK WARNE & Co., Bedford Street, Strand.

In large crown 8vo, price 7s. 6d. cloth gilt.

BOUTELL'S HERALDRY. New Edition. Edited and revised, with additions to date, by **S. T. AVELING**. Containing 500 Illustrations.

"A carefully done and exhaustive piece of work. Will be found useful to many, and we are glad to call attention to its appearance."—*Academy*.

FREDERICK WARNE & Co., Bedford Street, Strand.

SATURDAY, JULY 11, 1874.

No. 114, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

LITERATURE.

THE FOURTH REPORT OF THE ROYAL COMMISSION ON HISTORICAL MANUSCRIPTS.

THIS Report, containing accounts of about sixty public and private collections of historical documents, has just been issued. The extent of it may be judged of by the fact that it fills nearly 900 pages of rather close print in double columns, the very carefully compiled index alone occupying about 240 pages. Of the importance of the Report as a contribution to historical literature the following summary of its contents will be a sufficient testimony.

The calendar of the manuscripts in the House of Lords has been completed, by Mr. Monro and Mr. M. A. Thoms, up to the end of March, 1641-2, and the portion of it from the beginning of the reign of Charles I. to the end of 1641 is printed at length in the appendix to the report. Of the greatest historical importance are certain depositions taken before the committee appointed by the Parliament in Scotland to enquire into the supposed attempt to seize upon the Marquis of Hamilton and the Earls of Argyll and Lanark. The circumstances of the case are well known as "The Incident," and occurred during the King's second visit. The main object of the enquiry was, no doubt, to find out to what extent Charles approved, or, as some asserted, instigated the attempt. Until this discovery was made, it was supposed that no portion of these depositions was extant, beyond the notes of them published in Balfour's *Annals of the Scottish Parliament*. The papers thus brought to light, more than 200 years after, contain much interesting information. Balfour, we read,

"mentions only Lieutenant-Colonel Hurry's (or Urry's) deposition as having been read, and makes no allusion to those of Lord Gray and Lord Ogilvie. Hurry, it seems, though 'given to aye pynt of aill,' was too honest to suffer himself to be implicated in an affair which might lead to 'cutting of throattis' in a manner little different from assassination. Lord Ogilvie states that he heard of the plot on the 11th of October, as he was going to dine at the Earl of Crawford's lodgings, from Captain Stewart, who told him that there was a meeting arranged there for the purpose of carrying it into effect. Hurry immediately gave information to the Lord General, the Marquis of Hamilton, and Earl of Argyll, and afterwards went with their permission to dine with the Earl of Crawford, while Hamilton and Argyll, as we learn from other sources, withdrew themselves from Edinburgh."

The papers in the House of Lords relating to Archbishop Laud's visitations are printed, for the most part in *extenso*, in the Appendix. The Commissioners felt that any abridgment would greatly diminish the interest and character of these papers. It is unnecessary to do more now than to notice the great importance attaching to these papers, especially at the present time. Scarcely less interest-

ing to the ecclesiastical historian are the documents relating to the notorious case of Peter Smart and Dr. Cosins, afterwards Bishop of Durham. Among the more interesting miscellaneous papers we note a petition of Katherine Hadley, servant to John Lilburne, detailing her own and her master's sufferings in prison, December 21, 1640; a petition of Anthony Danvers, December 24, 1640, complaining that his son had been refused admission to Winchester College, a matter not too trivial for their lordships' consideration; and a petition of Osmund Gibbs, in 1640, found guilty of stealing a tame buck, and put to read for his life, when the judge not only made "a clear bar to prevent prompting, but turned him unto one of the hardest verses of the book to read, which by God's grace he was enabled to do, and thereby escaped his intended hanging, but was burnt in the hand."

The main bulk of the collection of documents belonging to Westminster Abbey, reported on to the Commissioners by Mr. Burt, consists of manorial documents, referring to the extensive estates possessed by the Abbey in early times, the accounts of the officers of the establishment, from the time of Edward I. to Henry VIII., and of the books and accounts relating to the collegiate church erected by Henry VIII. in the place of that establishment. Many of these documents are minutely illustrative of the manners and customs of the age, and are rich in topographical information, showing the progress of the vast change which has come over that portion of the neighbourhood of London.

Foremost in importance for the history of the sixteenth century we must place the Cecil MSS., belonging to the Marquis of Salisbury, a portion of which has been noticed in the Third Report of the Commission. Mr. Brewer's report, in continuation, gives a brief enumeration of all letters and papers down to the close of the year 1587. The value and extent of this correspondence, to which every person of any note at the time contributed, may be judged by the fact that scarcely a day passes in any year from the accession of Edward VI. to the close of the century which does not produce one or more letters connected with passing events, and generally from those whose rank and position enabled them to furnish the most secret and authentic intelligence. The bulk of these papers is so great, that the present report upon them is of necessity limited to a list of the writers and the dates of their letters; but we believe a complete calendar of them is in preparation. Mr. Brewer, however, calls particular attention to two letters written by Cardinal Wolsey, after his fall, to Secretary Gardiner, said to be of special and unique interest; and to two Casket letters of Mary Queen of Scots, which fill up the blanks in the collection amongst the State Papers, one of them in a hand differing from all the rest, which has not yet been identified.

Also relating to the Elizabethan period are some valuable manuscripts in the possession of Lord Bagot. Many letters in this collection are written by Walter and Robert, Earls of Essex; some by Thomas Phellips regarding Giffard, a Papist, to whom leniency was to be shown because his son

had been the means of saving the Queen from Babington's conspiracy. A letter in 1600 gives a short account, by an eye-witness, of the trial of Robert Earl of Essex, and records the Queen's indignation against Raleigh. For the years 1585, 1586, and 1587, there are letters by Sir Ralph Sadler, Sir Amias Paulet, and others, dated from Tutbury, Chartley, and Fotheringhay, relating to Mary Queen of Scots, her trial, and her burial. There is also a contemporary account of the proceedings taken in the Star Chamber against Secretary Davison, who was exposed to the displeasure of Elizabeth for despatching the warrant for Mary's execution.

The most important illustrations of the reigns of the Stuarts brought to light by the Commissioners are contained in the manuscripts at Knole Park, belonging to the Earl De La Warr. The greater portion consists

"of the letters and papers of Lionel Cranfield (successively Lord Cranfield, Viscount Cranfield, and Earl of Middlesex), Lord High Treasurer of England. He witnessed the fall of Lord Chancellor Bacon, two or three of whose letters grace this collection. His own impeachment was soon to follow, and there are numerous letters and papers on this subject. His friends were urgent to obtain mercy for him, but Prince Charles and the Duke of Buckingham were opposed to their request, and on one occasion the King delayed reading a petition from Cranfield while they stayed in the room. Among the items of intelligence likely to interest the historian will be found the expenses of the funeral of Queen Anne, consort of James I.; the gifts obtained by Buckingham from the Crown; a list of the magnificent jewels the Treasurer was commanded to take out of the Tower for the Prince on his journey into Spain; the large demands for money made by the Prince at Madrid, where Buckingham's conduct called forth a letter from a Spanish nobleman to King James, of which a copy is preserved at Knole. The affairs of the Palatinate produced many letters to the Treasurer, among them from Sir Richard Weston, and from the King and Queen of Bohemia, to whom James I. made a liberal allowance. There is a petition signed by Raleigh and letters from his widow."

Referring to a little earlier period are the notes of a conversation between William Lambarde, the well-known lawyer and antiquary, and Queen Elizabeth, in which Lambarde mentions Shakespeare's *Richard II.* having been many times performed in public, at the instigation (evidently) of the Earl of Essex, with a view to bring Elizabeth into disfavour with the people.

It is much to be regretted that our notice of the magnificent collection of the Earl De La Warr is so restricted, but some idea of the interest and value of it may be gained when it is known that there are contained in it letters by Queen Henrietta Maria, the Princess Henriette d'Orléans, Sir Dudley Digges, Sir Dudley Carleton, Sir Richard Weston, Tobie Mathew, Philip Burlamachi, Sir Leoline Jenkins, Sir John Suckling, John Dryden, Thomas Shadwell, Matthew Prior, Sir William Penn, Sir Charles Sedley, Lord Keeper Williams, Bishop Sprat, the first Earl of Shaftesbury, &c., &c.

Respecting the collection at Crowcombe Court, in Somersetshire, we are told:—

"Lieutenant-Colonel Carew's manuscripts comprise much to illustrate the latter years of King James I. and the reign of his successor. Seven

volumes contain Elsynge's Original Notes of Proceedings in the House of Lords, from 1621 to 1628. Here, too, are Sir John Borough's notes of the proceedings at the Treaty of Ripon; and memorials by Elsynge and others of the practice and constitution of Parliament. The volumes containing notes of petitions to King Charles I., with the answers, from 1625 to 1637, disclose much information both curious and useful. As personal applications to the Sovereign for places, pensions, and monopolies, and for pay in arrears, were frequent in those days, these volumes supply information on a variety of subjects, and furnish new facts for biographers. To an earlier period belong copies of letters by Lord Treasurer Paulet, Queen Elizabeth, Walsingham, King James, Raleigh and Bacon; papers relating to Mary Queen of Scots, and a long poem by Philip Arundel, written from the Tower, in 1687. There are numerous papers on Irish affairs in the sixteenth and seventeenth centuries, including valuable collections by Sir James Ware."

A vast amount of new material for the history of the first Civil War is to be found in the papers of the Earl of Denbigh, a full abstract of which, by Mr. R. B. Knowles, appears in the Appendix to this Report. Basil Earl of Denbigh was appointed by Lord Essex Commander-in-Chief within the associated counties of Warwick, Worcester, Stafford, and Shropshire, in June, 1643. In April, 1645, he laid down his commission, in obedience to the Self-denying Ordinance. The letters relate chiefly to the period embraced by these dates, and contain important information touching the events of the war within the counties under Lord Denbigh's command and their adjacent parts. The services rendered by the Earl to the Parliament were conspicuous in the taking of Cholmondeley House, Chester; Russell House, Staffordshire, by which he opened the passage between Coventry and London, and of which a long and interesting narrative is contained in these papers; and the relief of Oswestry, for which he received the thanks of both Houses of Parliament, at a time when nobility and gentry were so unpopular that Lord Willoughby writes to him, "till I saw this day the noble expressions of you so unanimously given by both Houses, and their free concurrence in writing a letter to you of thanks, I thought it a crime to be a nobleman." Two volumes of family letters, of great interest from a domestic point of view, are also noticed by Mr. Knowles. Amongst the writers contributing to the Denbigh papers we observe the Duke of Buckingham, the Countess of Buckingham, the Marquis of Hamilton, Sir Kenelm Digby, the Earl of Essex, Lords Wharton, Willoughby, and Fairfax, and Sir William Waller.

The Coventry papers, in the possession of the Marquis of Bath, seem to have considerable value for the history of the period following the Restoration, and fully deserve the space accorded to them by Mr. Alfred J. Horwood in his report. Henry Coventry was ambassador to Sweden in 1664, and ambassador extraordinary to Sweden in 1671; he was Secretary of State from 1672 to 1680, and died in 1686. Some of the papers of his father, Thomas Lord Coventry, and of his brother Sir William, secretary to the Duke of York, and a Commissioner of the Navy, came to him, and these, with his own official papers, form the collection at Longleat.

They comprise, besides private letters, official letters from ambassadors, consuls, and officers at most of the European Courts, and at many of our possessions out of Europe. The official letters and papers about the Treaty of Nimeguen occupy five large volumes. The letters from France are numerous: some of the writers being Sir W. Lockhart, Sir David English, J. Brisbane, and the Earl of Sunderland. It may suitably be mentioned here that the Duke of Northumberland presented to the British Museum a few years ago three volumes of copies of letters written by Henry Coventry to various persons at home and abroad, while he was Secretary of State.

The Marquis of Bath's collection also includes many letters and papers relating to the first Earl of Shaftesbury, which have not hitherto been known, together with his petitions to the King whilst confined in the Tower in 1677. Interesting notices are also found of the Duke of Monmouth, Algernon Sidney, the Popish Plot, Titus Oates, Coleman, &c.

Relating to the same period also are some curious gossiping letters belonging to Mr. J. J. Rogers, of which the following extract from one dated "1670, the last of Feb., London," is a specimen:—

"Saturday last at night was killed a beadle, the constable's assistant, for attempting a house in or near Whetstone Park, a scandalous place, where was the Duke of Monmouth, the Duke of Albemarle, and the Duke of Somerset, with others, at a very unseasonable time. . . . At the same time, though in some other place, was killed my Lord Holli's eldest son by a groom, which had married my Lord Cullies' daughter, which indignity he thought to have avenged; and also, in some other place, was one of the Life Guards killed in a duel by one of his fellows."

The most interesting manuscript in the possession of the Marquis of Hertford is a quarto volume containing the Latin poetical compositions of Daniel Rogers, a person of some note in the reign of Elizabeth. He was sent by the Queen on diplomatic business to Germany, France, and Denmark, and succeeded Robert Beale in the office of Clerk of the Council. These employments introduced him to numerous persons of distinction both at home and abroad, and a great number of them are commemorated in this volume.

The Towneley papers consist chiefly of collections for the history of Lancashire and Yorkshire, made by Christopher Towneley in the seventeenth century; but some original manuscripts are preserved with them, from one of which a most important discovery was made by Mr. Knowles relative to Edmund Spenser. This, however, has formed the subject of a separate article in these pages (see ACADEMY, vol. vi. p. 8), so nothing more need be said about it here.

The representatives of the late Colonel Macaulay allowed the Commissioners to examine a box full of letters, written by and to the notorious John Wilkes. The report upon these by Mr. Horwood is full of interest, but we shall not attempt at present to analyse it. As these letters throw much new light on a very eventful period of our history, we may take an opportunity, at some future time, of drawing attention to them.

Mr. H. T. Riley has continued his inspection of the earlier archives of the Colleges of Oxford and Cambridge. At Balliol College, Oxford, are some curious contemporary notices of John Wycliff, the reformer. From the records of St. John's College, many notices of Archbishop Laud, who was scholar, fellow, and president of the college, are extracted and printed in this Report. A letter of Laud, too, long and interesting, was found among the papers of President Accepted Frewen, in Magdalen College. It was written while he was Bishop of London, and relates to Lord Pembroke's gift of the Barocci MSS. to the Bodleian Library. Here, too, is the final decree of the Ecclesiastical Commissioners of James II. against Hough and the fellows who elected him president, dated December 10, 1687; this was given to the college by Bishop Z. Pearce, in 1749. At St. Catherine's College, Cambridge, the most valuable muniment is the Black Book or "Memoriale" of Robert Wodelarke, the founder; it contains ample information regarding the early history of the college, its original property, &c. Oliver, second son of Oliver Cromwell, was entered at this college, but took no degree. In the admission books, too, are notices of the family of Calamy, the famous Lord Cutts, and William Wotton, the voluminous writer and translator, esteemed a prodigy of learning, who entered the college when only nine years and eight months old. From the "Admonition Book" of Emanuel College, Cambridge, there is manifest proof that corporal chastisement was inflicted upon undergraduates as late as the year 1667. This tends to confirm the assertion made by John Aubrey, hitherto much in dispute, that similar discipline was in use at Oxford, and shows that there is no great improbability in the story told of Milton having had to submit to similar punishment when a student at Christ's College, Cambridge.

Mr. Riley also reports upon the records of the Corporations of Hythe, New Romney, &c., &c., which contain matters of considerable interest, chiefly, however, of a local nature, so we need not direct further attention to them.

Many of the muniments of the Dukes of Argyll were dispersed, and many more suffered from neglect, owing to two successive forfeitures in the family—the one of Archibald Marquis of Argyll, in 1661, and the other of his son Archibald, ninth earl, twenty years later. A large collection of charters, commissions, and correspondence, however, still remains, upon which a very full report is given by Mr. Fraser. Among the charters we notice one of the barony of Boquhan, in the county of Stirling, granted to the fourth earl in 1546, by Queen Mary, which bears the contemporary endorsement, "To Archibald Roy," or the red, indicating the colour of his hair. This Earl's son was in great favour with the Queen, who visited him at Inverary Castle; and in her letters to him she subscribed herself his "right good sister" and "best friend for ever." The original commission, signed by Queen Mary, appointing him Lieutenant-General of the kingdom, on the eve of the battle of Langside, is printed at full length. The different grants and commissions, while showing the

power wielded by the Earls of Argyll, illustrate more particularly, says Mr. Fraser,

"the distracted state of the highlands and islands of Scotland, and the difficulty of preserving order and peace in these remote parts, over which the Government had no adequate control. The wild clans are described as 'void of the fear and knowledge of God,' delighting in nothing but murder and a 'savage form of living;' 'avowed enemies to all lawful traffic;' 'an infamous byke of lawless lingers' (i.e., wasps' nest of lawless vagabonds)."

The MSS. of the Hon. Mrs. Erskine-Murray consist chiefly of letters of the seventeenth and eighteenth century, many of which have great historical interest. The correspondence of Sir Charles Erskine as Commissioner of the Assembly of Divines at Westminster; of Sir John Erskine and the Jacobites; of the Erskines, Earls of Mar; and of William Marquis of Tullibardine, and his brother Lord George Murray, form the main portion. Amongst them are to be observed a letter of the Chevalier St. George to Sir John Erskine, informing him of his intended early marriage, and exhibiting his convivial habits; and a part of a letter (a copy) relating chiefly to Lord Bolingbroke, which severely censures that nobleman for neglecting to provide arms and ammunition for the support of the interests of the King (the Chevalier).

The Report also notices a small series of letters relating to James Burnett, Lord Monboddo. Among the writers of these we observe Lord Chancellor Thurlow, Dr. Thomas Reid, and Eliza Berkeley, the wife of Dr. George Berkeley, second son of the bishop.

The collection in the possession of Mr. Charles Dalrymple, M.P., which is reported on by Dr. Stuart,

"consists mainly of the manuscripts and correspondence of the late Lord Hailes, the well-known historical writer. The letters are no less numerous than historically important. In one of them Burke praises the erudition of members of the Scotch bar, and adds, 'I am every day more and more convinced that they are not the better professional men for not being more extensively learned.' Horace Walpole, writing at the conclusion of his *Anecdotes of Painting*, speaks of the abatement of his literary ardour, and the loosening of his attachment to the world, and adds a curious piece of information relative to an intended invasion of the country in 1745. There are letters from Pennant, and a series of some interest from James Boswell, in the year 1763. One from Dr. Jorton, in 1760, relates to Boswell, and shows that he had been for a time a Roman Catholic. A characteristic letter from David Hume is dated in 1754, and the answer to it by Lord Hailes has been preserved. Besides many manuscripts of Lord Hailes' published historical works, there remain books of memoranda, anecdotes, criticism, and law notes. There are besides several volumes of a diary of the campaigns in the Low Countries in the time of Queen Anne, which have been ascribed to Field-Marshal the Earl of Stair."

Among the royal letters belonging to the Marquis of Breadalbane, are specimens from Mary Queen of Scots, James I., and Charles I. In the same hands are large masses of correspondence between leading men of the period between 1560 and 1690, specially notable being those relating to the Massacre of Glencoe.

Many other collections in Scotland were examined and reported upon by Mr. Fraser

and Dr. Stuart, but they are chiefly valuable for purposes of local topography and genealogy.

Mr. J. T. Gilbert has been employed during the past year in Ireland in examining the manuscripts of the Marquis of Ormonde, Viscount Gormanston, Sir Richard O'Donnell, Trinity College, Dublin, and the former College of Irish Franciscans at Louvain. The Ormond archives form one of the most magnificent private collections in the United Kingdom. For the present, however, the report upon them is confined to a bare catalogue of the letters and their writers, between the years 1572 and 1664; these number upwards of two thousand, and are connected with important public affairs in England, as well as in Ireland, during that period.

This notice of the Report, lengthy though it is, gives but a very imperfect idea of a most remarkable collection of historical materials. Upon nearly every page of the volume are to be found novel and interesting allusions to great men of the past, or quaint and curious illustrations of bygone life and manners. That the previous labours of the Commission have been appreciated by the public is well shown by the extraordinary demand which has existed for the earlier Reports, one of which is now out of print. The present Report far exceeds in interest and in bulk all those which have preceded it, and amply justifies us in our expectation of many precious discoveries yet to be made by the researches of the Royal Commission on Historical Manuscripts.

J. J. CARTWRIGHT.

THE NEW DODSLEY.

A Select Collection of Old English Plays. Originally published by Robert Dodsley in the year 1744. Fourth Edition. With new Notes by W. Carew Hazlitt. Vols. II and III. (London: Reeves & Turner, 1874.)

We have here some more specimens of the moralities and interludes that occupied nearly the whole of the first volume. The audience is frequently reminded that it is being instructed, and that if it be not improved the fault is its own. Only in the later pieces of this kind is there some faint recognition of the necessity of amusement. In the very last—*Like will to Like*—to show the "final end" of the vicious is the main purpose of the author. That end is, according to circumstances, either beggary or hanging. And since

"Some do matters of mirth and pastime require,
To please all men is our author's chief desire,"

says the Prologue. The desire is attained by the introduction of Satan himself:—

"The Devil with the collier, the thief that seeks a thief,
Shall soon make you merry, so shortly you shall see."

In the *Trial of Treasure* the Prologue, after due citation of Diogenes and St. James, informs the spectators that

"Both merry and short we purpose to be
And therefore require your pardon and patience;
We trust in our matter nothing you shall see
That to the godly can give any offence."

If the writer feared to be too amusing, he

certainly disquieted himself in vain. These productions are as tedious as Dogberry himself could have wished to be; but they interest us by the side lights they cast on the manners of the time, and as a part of the history of our drama. The exploit of Riot, who broke away from the gallows, and in his flight came across a nobleman's page whom he instantly robbed, was doubtless a real occurrence. The reception of the "new learning," and the conservative (and not altogether unreasonable) objections thereto, are faithfully reflected in passages of *Lusty Juventus*, and form the subject of *New Custom*. Glancing at minor matters, the reader will doubtless notice the curious variety of oaths, and the singular want of even dramatic propriety observed in their use. The reprobate Riot asseverates "so God me save," and "trusts to God Allmight" that he shall be hanged. Youth, when gibing at Charity, who is endeavouring to convert him, replies:

"Sir, by God that me dear bought,
I see your cunning is little or nought;"

though when he is exhorted to "save what God hath bought," inconsistently rejoins,

"What say ye, Master Charity?
What hath God bought?
By my troth I know not
Whether he goeth in white or black
I wis he bought not my cap
Nor yet my jolly hat;
I wot not what he hath bought for me."

This interlude of *Youth* appears to have been inadvertently misplaced in this collection. It is the Catholic—it would not be fair to say the Romanist—counterpart of *Lusty Juventus*, which should have preceded it. It is a production of the reign of Mary, and *Juventus* by internal evidence was performed in the reign of Edward VI. *Youth*, who has Pride for his servant and Lechery for his mistress, is converted with the usual suddenness, and to confirm him in his pious intentions receives beads, a mantle, and a new name—Good Contrition. Except the "beads," there is nothing distinctively Romanist in the piece. The repentance is set forth in the simplest form possible, *Youth* kneeling down and asking God's forgiveness. The hero in *Juventus* enters, singing, and intent on overtaking some minstrels, that he may have "a dance or two." Good Counsel dissuades him, on the Puritanic ground that dancing is not one of the modes of passing time appointed in Scripture. *Youth* is impressed by the exhortation of Good Counsel, and prays for Knowledge, who immediately enters. After a long catechising, the advisers of *Youth* depart for a season, and the Devil enters, deploring the progress of the "new learning." To withstand it more effectually, he summons his son Hypocrisy, who gives an account of his exertions in their common cause. Hypocrisy's list of "holy" things reminds the reader of a well-known passage in the *Ingoldsby Legends*, but the older is the longer catalogue. It includes—

"Holy hermits, and holy friars,
Yea: and all obstinate liars;
Holy crosses, and holy staves,
Ah! good holy, holy knaves."

Hypocrisy, under the assumed name of Friendship, sets himself to beguile *Juventus*, who is "going to a preaching." He ridi-

cules his zeal, and advises him how he may keep up appearances with the "new gossellers," and yet follow his own devices. Juventus is induced to accompany Hypocrisy and Fellowship to a rendezvous with Abominable Living, a female servant, whose master and mistress are absent "at the preaching." She hurries in to tell her guests that they may enter the house, and all four go off singing merrily. On his return from this revel, Juventus is confronted by Good Counsel, who upbraids him with his evil courses. The repentant youth confesses his sin, and welcomes the entrance of God's Merciful Promises. The piece then concludes with the usual prayers for the king and the nobility.

Jack Juggler is a scene of pure farce, showing the trick played by the hero, a roguish page, on another boy, Jenkin Care-away, servant to Master Bongrace. The latter is persuaded by argument of fist that he is not himself, but that Jack is really Jenkin. The notion may have been suggested by the scene between Mercury and Sosia in the *Amphitruo* of Plautus, but all resemblance between the pieces ends there. The inner meaning of the "trifling interlude" is expounded in some verses at the end, setting forth the evil "fashion of the world now-a-days," and how innocents are "by strength, force, and violence oftentimes compelled

"To believe and say the moon is made of a green cheese,
Or else have great harm, and percase their life to lese."

One is uncertain whether this lament is the ordinary regret for the degeneracy of "now-a-days," common to all days that have left any record of themselves, or part of that systematic extenuation of mirth which made the diffident authors of these interludes prefix to them some authority for laughter, from Cato the Censor or other ancient of approved gravity.

The *Disobedient Child* and *Nice Wanton*, in their comparative freedom from direct allegory, may be classed with *Jack Juggler*, but instead of a single scene, they present a series of tableaux from the story of the characters. Allegory, however, refuses to quit altogether its ancient home. In *Nice Wanton* it asserts itself in the queer jumble of names—the mother Xantippe, the bad children Ishmael and Dalilah, the good boy Barnabas, Dalilah's lover Iniquity, and the ill-adviser Worldly Shame. When the evil course of Ishmael and Dalilah has run (with the result, to each respectively, of the fates of Bardolph and Mrs. Quickly), the well-behaved Barnabas comforts Xantippe, and prevents her from committing suicide at the suggestion of Worldly Shame. The hero of *Disobedient Child* is a certain young man who rejected his father's advice to go to school, and precociously insisted on marrying. We are given glimpses of his hasty wooing, and of his miserable wedded life. His fortunes decline from his extravagance, and when evil days come, his wife is like the days. She forgets her honeymoon tenderness, when she declared herself entirely of the opinion of Hierocles as to the comfort and dignity of wedlock. She "strikes her husband handsomely about the shoulders," and insists

upon his selling faggots for his living. The victim sneaks away to his father, during her temporary absence "with her gossips." His father administers the cold comfort of "I told you so," and advises his immediate return to his wife. He will give him some little to help his needy living,

"And that once done, thou must hence again,
For I am not he that will thee retain."

The Perorator points the obvious moral in a long speech.

The rule of "nec Deus intersit" was not held to extend to the Devil, who enters to deliver a soliloquy, setting forth his satisfaction with his general cleverness, and especially with the success of his machinations in this instance; for, it seems, all that the rash young man did was by his instigation. Having delivered himself of this weighty utterance, Diabolus remembers that he has other business:—

"But now, I know, since I came hither,
There is such a multitude at my gate,
That I must again repair down thither,
After mine old manner and rate."

Passing over the *New Custom*, a dramatic apology for the Reformation; the *Marriage of Wit and Science*, a more elaborate treatment of the theme of the *Four Elements*, in Vol. I.; and the *Trial of Treasure*, a similar variation on *Everyman*, in that volume—a few words are due to the pieces which, in some respects, are the most important of all here given—*Jacob and Esau*, *Roister Doister*, and *Gammer Gurton's Needle*. They are the true beginnings of English comedy and farce. The last-named is familiar (in extract) to most readers. Its famous drinking-song, "Back and side go bare," has been reprinted many a time since Warton quoted it, with needless apology, in his *History*. Hazlitt said of its humour, "coarse, perhaps, but kindly, let no man despise it."

Ralph Roister Doister is "the first regular comedy in our language," and sets forth the wooing of a widow by the braggart hero. The widow is contracted to an absent merchant, who returns in time to witness the discomfiture of his would-be rival. The by-play is sustained by the humours of Matthew Merrygreek, the hero's parasitical adviser, and of the widow's household. The picture of the domestic life of the time is doubtless as faithful as it is agreeable. The mistress holds the reins firmly, yet the servants have a pleasant life enough, as they troll their ditty:—

"A thing very fit
For them that have wit,
And are fellows knit,
Servants in one house to be
To fast for to sit
And not oft to flit
Nor vary a whit,
But lovingly to agree, etc."

Jacob and Esau is the first five-act play in the collection. The subject is treated with considerable skill, the outline of the Bible story being set in an imaginary framework and thus expanded, not falsified. Ragan, Esau's man, his butt and familiar, is boldly drawn, and Mido, the page of the household, is no unworthy precursor of Speed and Moth. Conventional types are for the first time discarded for the sake of character, and Esau, rough but not ill-natured, the demure

Jacob, the wily Rebecca, and Isaac, past all keen interest in life, carry on the plot with animation. A humorous scene—too long to extract—is that wherein Esau, enraged at the success of Jacob, orders out the servants with the intention of giving them a beating all round, but lets them go scot-free one by one, his latent good temper and generosity becoming apparent when they are once thoroughly in his power. There is some simple comedy, too, in the dialogue between Isaac's neighbours, aroused before daylight by Esau's noisy preparation for the chase:—

Hanan. "Ah, sir, I see I am an early man this morn,

I am once more beguiled with Esau's horn,
But there is no such stirrer as Esau is;
He is up day by day before the crow
[flies];

Then maketh he with his horn such toothing
and blowing,

And with his wide throat such shouting
and hallooing,

That no neighbour shall in his tent take
any rest

When Esau addresseth him to the forest.

So that he maketh us, whether we will
or no,

Better husbands than we would be, abroad
to go

Each of us about our business and our
work.

But whom do I see yonder coming in the
dark?

It is my neighbour Zethar, I perceive him
now.

Zethar. "What, neighbour Hanan, well met, good
morrow to you.

I see well now I am not beguiled alone:
But what boot to lie still? for rest we can
take none;

That I marvel much of old father Isaac
Being so godly a man, why he is so slack
To bring his son Esau to a better stay."

Scraps of songs occur here and there in these plays; none, indeed, equal to the Gurton ballad, but yet with some lyrical feeling. An easy lilt sung by Pleasure in the *Trial of Treasure* is not far removed from the "unconsidered trifles" in the budget of Autolycus:—

"O happy days, and pleasant plays
Wherein I do delight—a,
I do pretend, till my life end,
To live still in such plight—a."

"Silly sooth," but with a certain spontaneity, is the song of Lust "as a gallant":—

"Heigho, care away, let the world pass,
For I am as lusty as ever I was;
In flower I flourish as blossoms in May;
Heigho, care away; heigho, care away!"

And the songs with burdens in *Juventus*—
"For a taste":—

"In a herber green, asleep where as I lay,
The birds sang sweet in the middes of the day;
I dreamed fast of mirth and play;
In youth is pleasure, in youth is pleasure, etc.

Do not the flowers spring fresh and gay,
Pleasant and sweet, in the month of May?

And when their time cometh, they fade away—
Report me to you, report me to you."

The old, ever new strain of youth and spring recurs, we hear, in these pipings. They are but as the twittering of a little bird here and there in the dark before dawn, and will speedily be forgotten in the burst of song poured from fuller throats to welcome the morning at heaven's gate, when "Phoebus' gins arise."

R. C. BROWNE.

La Province de Smyrne. Par Charles de Scherzer, Consul - Général d'Autriche-Hongrie à Smyrne. Traduit de l'Allemand par Ferdinand Silas. (Vienne: Alfred Hölder, 1873.)

It is not often that we meet with so elaborate and exhaustive a report as that of M. de Scherzer on the Province of Smyrna, considered from a geographical, economical, and intellectual point of view. This report owes its origin to the Vienna Exhibition, and has for its special object the development of commerce between Turkey and the Austro-Hungarian Empire.

M. de Scherzer commences by giving a careful geographical sketch of the province, from which we learn incidentally that minerals exist there in great abundance, but that the want of good internal communications stands much in the way of the successful development of this branch of its resources. Inexhaustible masses of iron exist in the north, but they cannot be worked profitably for this reason, and owing to the want of coal. The climate of the country is temperate, though hot in the summer, and generally speaking there is hardly any rain between April and November, but during the rest of the year storms and rain are of frequent occurrence. Snow is extremely rare in Smyrna itself, though common in the mountains, whence it is brought to the city in summer. In spite of local fevers the district of Smyrna enjoys a very salubrious climate, and its inhabitants in general, but especially those in the country parts, live to a very great age.

M. de Scherzer devotes some space to agriculture, and from what he says everything connected with it seems to be conducted in the most primitive fashion, for the Turkish peasant is hostile to all innovations in husbandry, and opposes a systematic and inflexible resistance to the Europeans who endeavour to introduce them. Under the head of Hygiène Publique, we learn that Smyrna, like the rest of the Ottoman Empire, has no sanitary administration, that its public works and buildings are not properly looked after, that the hospitals are not subject to any public supervision, and that the schools are under no control in all that relates to hygiene.

For administrative purposes the province is divided into four Sandjaks (*arrondissements*), each presided over by a governor. Every Sandjak is subdivided into districts, or *Kazas*, under deputy governors. The *Kaza*, again, is divided into *Müderlik* (*mairies*). The whole province is ruled by a Vali or Governor-General; but the customs, post-office, and telegraphs are directly subordinate to their departments at Constantinople. The arrangements for the administration of justice are, as might be expected, affected by the heterogeneous elements collected together in a vast commercial centre like Smyrna, and owe their existence to the difference in the manners, religion, and language of the nationalities with which the Ottoman Empire is peopled.

It is a difficult matter to state with any degree of precision the number of the population in a country where there is no census; but after careful consideration, M.

de Scherzer is of opinion that the province contains very nearly a million souls, comprising 400,000 Turks, 300,000 Greeks, 40,000 Armenians, 30,000 Jews, 200,000 Turcomans, &c., and 5,000 Europeans. In his remarks under this head M. de Scherzer speaks highly of the energy of the Greeks, and says that they have the best schools, and are nearly all of them able to read and write, which is by no means the case with the Turks, owing to the difficulties presented by their written language. Notwithstanding the diversity of the races, nationalities, and faiths which are congregated together in the city, the various groups, in appearance at least, live peaceably. In the last century Smyrna possessed hardly a single "établissement hospitalier," but during the past ten years more attention has been paid to the poor and sick, and there are now several charitable institutions.

Of late years great progress has been made in public instruction, especially since the last war in the East (1854), for the population has taken an active part in the establishment of new schools, and in the reform of the old ones; and the manners of the Smyrniotes have in consequence been gradually improved. The Mussulman element, however, seems to be still opposed to the new order of things, but there is reason to hope that this feeling on their part will soon yield to the force of circumstances.

Apart from two short lines of railway, the means of communication in the interior of the province are in a very primitive state; there are scarcely any bridges, and those which are to be met with were constructed several centuries ago. Five lines of steamers trade regularly to Smyrna, and the city is in telegraphic communication with the rest of the world.

Smyrna is the only one of the great cities on the west coast of Asia Minor, which has survived from ancient times, and still retains its importance as a great emporium of trade between Europe and Asia; and, judging from what M. de Scherzer says in his chapter entitled "Histoire du Commerce," it would seem to owe not a little of its present prosperity to the attention which England paid to the Mediterranean trade at the end of the seventeenth century. The American civil war has had a decisive effect on the cultivation of cotton in Asia Minor, as well as in other parts of the globe. Before 1862 the amount annually raised did not exceed 12,000 bales, whilst in 1872 it increased to 150,000 bales. After North America there is no country of which, in M. de Scherzer's opinion, the soil and climate are better suited to the cultivation of cotton than those of Asia Minor, and the development of this branch of industry ought to be encouraged in every possible way by the Turkish Government. Besides his remarks on the cultivation of cotton, M. de Scherzer gives much information which is valuable from a commercial point of view in his chapters on the products of the vegetable, animal, and mineral kingdoms; and in that on Industrial Products he tells us that the most important branch of industry in Anatolia, and up to a certain point in the Turkish Empire generally, is the manufacture of carpets, of which about a tenth part is

used in the interior, and the rest is sent to England, America, and France.

In an appendix M. de Scherzer gives a paper on the inundations of the Gedyse (formerly called the Hermos) by a French engineer, and a separate report on the island of Mytilene by the Austro-Hungarian Vice-Consul there; and the volume under review further contains maps of Asia Minor, and several comparative tables showing the fluctuations in the prices of various articles of commerce during the ten years from 1863 to 1872.

EDW. DUFFIELD JONES.

Curtius' History of Greece. Translated by A. W. Ward. Vol. V. (concluding the Work). (London: R. Bentley & Son, 1874.)

THE appearance of the fifth and last volume of this popular work, in its English dress, gives us an opportunity of looking at the author's book as a whole, and of summing up the gains which the students of Greek history have made by this addition to an already voluminous literature. The great question in the present day, when the press is inundated with all manner of histories, is this: What has the new work told us which was not in the old? and again: Has the new work refuted errors in the old, or is the old work, after all, sounder, and are the so-called improvements of the new mere *Verschlimmbesserungen*, as the Germans call them?

English classical scholars especially, who have been brought up on Grote, and are used to look upon his great book with reverence, will be disposed to ask what additions there can be made to his masterpiece, until new documents or new pieces of evidence turn up. Yet notwithstanding the great English historian's exhaustive history, as it seemed to be, the reader will be surprised at the wide differences in Curtius' shorter book, as well as by the number of new and interesting facts and inferences brought out in it. This book belongs to a style of histories which I would call *Mommsenesque*, from their being constructed on the plan of the now famous History of Rome, by Theodor Mommsen. Their peculiarity is a mixed courting and contempt for the public, such as was said to be the main feature in Alcibiades' conduct at Athens. They appeal by a moderate size and price, by an attractive and picturesque style, and by a clear and downright dogmatism to the outer world, which will not weary itself with the pedantry and cumbrousness of modern German philology. But though they court the public so far, and profess to lead it, they treat the reader with contempt, if he desires to see full evidence for some new statement, or some grave inversion of received historical beliefs. The authors, being men of learning, require us to assume that they have read and weighed all the evidence, nor will they condescend to be questioned about authorities. So Mommsen's startling book contains (I may say) no verifications whatever of his assertions, and when we find him painting some character or some scene concerning which we had all along thought there was no extant evidence, we ask him in vain for proof; he will enter into no discussion; his *ipse dixit* must suffice us. This was Curtius' original plan also, and in Mr. Ward's first

volume, unfortunately translated from the first edition, the reader will look in vain for any proof of many strange and interesting novelties. Professor Curtius has, however, modified his plan, and in the improved third edition of his first volume has condescended to insert a moderate number of very valuable references, which Mr. Ward should have added to his last volume by way of postscript.

Yet even here, the treatment of the reader, and of previous writers, is rather contemptuous. The references are without discussion, and almost without comment. Thus we are told (i. p. 170, in the original), in opposition to Grote's famous argument against the subdivision of Spartan lands by Lykurgus, that this subdivision rests upon a "thoroughly trustworthy tradition," and Plutarch's *Lykurgus* is cited (note 18) as enough for us. This is extremely unsatisfactory. There is indeed some early evidence for it which Mr. Grote (I think) misunderstood or underrated, and which shakes his positive theory of its invention in Agis' time (cf. Grote, vol. ii. p. 530 sqq.). But even supposing these isolated notices (Ephorus, fr. 64, ed. Müller; and Plato, *Laws* iii., p. 684) were sufficient (which they are not) to overthrow Grote's negative argument, they should have been quoted and discussed; and to cite a mere statement of Plutarch seems an almost impertinent ignoring of Grote's scholarly and able argument. So again, in many other cases, we are referred, not to the original authorities, which we can all reach, but to some obscure monograph by some German scholar, which could only be found in a German university library, if even there. This is that contempt for the public shown in these Mommsen-esque popular histories. I shall show presently how the courting of popularity has led to graver defects.

Passing from the plan of Curtius' history (which I hold to be an imperfect compromise between two inconsistent objects) to estimate the results he has attained, I think every fair critic will be greatly struck with the superiority of the early part of the book over the longer and more explicit volumes of Grote. There is a keener feeling for the physical aspects of Greece, and a great deal of picturesque writing about it which speaks of the author's intimacy with the scenes he describes, and engages the reader's interest at the very outset. It is a far better introduction than the bald recital of the myths in Grote's book. And not only is it more interesting, it is more philosophical. Instead of severing altogether myth and history, and getting rid of the former by simple recital, Curtius feels that there is early history to be found in these myths, early affinities of tribes, early religious confederacies, evidences of trade and other intercourse. These hints are worked up with great skill into results, which though not more than probable, yet rightly find their place in a philosophic history. Later researches have, however, greatly aided Greek historians in their work, and there is really a body of new evidence since Grote wrote. Not to speak of the stray hints now found in hieroglyphics (i. pp. 40, 391 of the original) and cuneiform writing about early contact with the Greeks, there are before us (pp. 17

sqq.) the results of the comparative study of language, of a deeper and better archaeology and survey of ancient sites, of a clearer insight into the history of coins and weights.* Brief as are the notes appended to Curtius' first volume, it is deeply to be regretted that the English reader has them not before him, as they show what indefatigable research and acumen has been applied in all these directions. Thus, for example (note to i., p. 226), the received date of Pheidon of Argos (Ol. 8, or B.C. 743) has given way (in spite of Grote's conservatism, ii. 423) to an excellent emendation of Weissenborn in Pausanias, where *κῆ* is read for *ῆ*, and the 28th Ol., mentioned by Julius Africanus as an *an-olympiad*, is found to remove many difficulties about Pheidon's relation to the coinage of early Greece, and disclose to us the real order of the events as implied by Herodotus. It is not then too much to say that Oriental studies, comparative linguistic, and archaeology have really remodelled this part of Greek history. Here Professor Curtius' book is a decided and great advance. It is less so, but still is so, in his excellent chapter on the Delphic religion, in that on the Greek colonies, and in his ingenious views upon the attitude of the tyrants, who were, in his mind, the promoters of an Ionic reaction against the Dorisation of Greece. There is, indeed, a great deal more of conjecture here than Curtius admits; many of his inferences are mere plausible guesses, but nevertheless these chapters are both ingenious and suggestive.

The case is widely different when we come to the age of fuller development in Greece, to the age where archaeological and linguistic learning in an historian should make way for political insight, and for a calm balancing of conflicting evidence. These are qualities not likely to be fostered by the education and habits of Germany, and consequently—as has been long since observed by Mr. Freeman, and lately, with more force, by Mr. Müller-Strübing—it is in this part of history that the English are likely to be superior. The two books I am now comparing afford a striking corroboration of this observation. Not only is the work of Curtius no advance on Grote's account of the Periklean and Demosthenic times, but it often recedes to the stand-point of Mitford, and shows Curtius to be so narrow and prejudiced in his estimation of evidence, that we feel a growing appetite for verification even in those earlier portions of the book which have so fascinated us.

The limits of this review permit me to cite only two instances out of many—his estimate of Kleon and his estimate of Demosthenes.

* Such works as Movers' *Phoenizier* make the stray appearances of Sidonians in Homer quite a question of historical interest. So Bachofen's *Mutterrecht* gives us an interest in the stray notices of the Lykian habit of counting relationship through the mother—a state of society indicated by the Greek form *ἀδελφος* (note to p. 71). Brandis' researches on the coins and metric systems of Western Asia open up new views as to trade and commerce among early and even primitive kingdoms. It seems strange that no notice is taken of the curious excavations at Therapsia, which have revealed dwellings and implements of the stone age under lava, along with pottery of a decidedly Greek pattern. Probably the discovery was not made known in time for the revised third edition of 1868.

In both these cases Curtius adopts the thoroughly uncritical method of selecting a single authority, which he so implicitly follows that all the collateral authorities are declared to be true or false according as they agree or differ with this single touchstone. Thucydides is, of course, Curtius' inspired test for the age of Perikles, and accordingly all the anecdotes of Ion, of Stesimbrotus, and other such men, preserved in Plutarch, all the attacks of the comic poets—all these are set down as simply false when they malign Thucydides' hero. That is not all: the whole age is glorified, and all the occupations of the state which he rules are noble and perfect. In five years' time we arrive at Kleon's period of influence. Against him the reader is told to believe all the jibes of Aristophanes, which were false against Perikles; he finds the ribald comedy, which was set aside as evidence against Thucydides' hero, Perikles, taken up and recited as strictly historical against Thucydides' enemy, Kleon. Nay more, all the occupations of the people as dicasts and controllers of a great empire, which were noble and great in 430 B.C., under Perikles, are disgraceful and idle in 425 B.C., under Kleon. There are two graphic and lively pictures drawn of these epochs, totally inconsistent and opposed, and yet reciting the same facts; and in vindication of this monstrous use of comedy as historical evidence, we have an astonishing sentence (ii. 426): "*Das waren die Schäden der entarteten Demokratie, die Aristophanes mit solchem Ernste angriff, dass er für einen ebenso schlechten Dichter als gewissenlosen Menschen und Bürger gehalten werden müsste, wenn nicht volle Wahrheit seiner Darstellung zu Grunde liege.*" No comment is required on such a statement, especially as Mr. Müller-Strübing has mercilessly exposed this and other random talk among the Germans in his *Aristophanes und die Historische Kritik*, pp. 49 sqq.

If we turn to Mr. Ward's fifth volume now published, we can show innumerable cases of the same random talk, the same *Phrasen-macherei*, as Mr. Strübing well calls it. Thus, when talking of Aristophanes (p. 102), who, by the way, was almost all his life in opposition, and not at the head of affairs, we hear that "*in proportion to its own want of energy, the civic community gave itself up to the control of individuals, and conceded to them such a degree of influence that they were able to exercise an arbitrary sway.*" When we think of Perikles, and how angry our author is when his omnipotence was even questioned, we feel somewhat surprised; but this surprise is much increased when we find in connexion with Demosthenes (p. 454) the following: "*Experience teaches that Greek republics were never more vigorous, or more covered with glory, than when their citizens, with perfect conviction, gave themselves up to one man, in whom they recognised the representative of their highest interest.*" What contradiction can be more flagrant? But then what Curtius really thinks, though he has never made it plain to himself, is this: if the Greeks submit implicitly to one of his heroes, nothing can be more excellent; if they submit to anybody else, especially to an opponent of these heroes,

it is a melancholy proof of depravity or decay. So all the great political history of Greece is written simply in the interest of two or three of the author's pets, in whose favour all opposition is distorted and magnified.

This method is even naively confessed by the author when he comes to speak of Demosthenes (p. 214, note): [Our conception of the Demosthenic age] "*depends on the personal attitude which we assume towards Demosthenes, upon the moral impression made upon us by his speeches, &c. Without denying him the character of a party orator, we shall yet be justified in regarding his speeches as genuine sources of history, if we believe in the truthfulness and honesty of his mind.*" The last italics here marked may be expounded by his official sketch of Demosthenes, where he says (p. 456): "He returns vituperation for vituperation; he employs all and any means for rendering his opponents contemptible." When we have read these very strange companion features, we turn to the body of the History with curiosity to see what the author makes of the attacks on Aeschines in the *Oration on the Crown*. We there find, despite of the above citations, that the obviously exaggerated picture of Aeschines' past life by his enemy is calmly set down as sober history, though he had before him Grote's wise and cautious reservation (vol. xi. p. 509) when quoting from Demosthenes the same passage: "Such at least is the statement which comes to us, enriched with various degrading details, on the doubtful authority of his rival, Demosthenes." Indeed, all through this part of his work, Grote's patience and caution is a fine contrast to the hasty and prejudiced judgments of his German successor. For with Curtius whatever Demosthenes says is true, whatever he does is right; and even such palpable political blunders as his silence on the exclusion of the Phokians in the treaty with Philip (Grote, vol. xi. p. 553) are smoothed away with some vague talk (p. 313). I need not descant upon the injustice done to Demosthenes' other opponents, such as Eubulus.

There is, I fear, in the author's desire to be picturesque and striking, a great tendency to wild and inaccurate writing—nay, sometimes we come upon sheer nonsense. Thus we are told (p. 156) "that no other of the great men of Greece is brought so near to us as a living man as Plato," which I hold to be absolutely false: Plato, as a man, is quite a stranger to us beside Socrates or Demosthenes. Again (p. 437): "It was not permissible to Philip to act like another Xerxes; the king who had made an Aristotle the tutor of his son could not refuse to recognise the soil of Attica as a sacred one!" In the immediately preceding paragraph, by the way, he tells us of the extreme harshness with which Philip treated Thebes, the city where he himself had been educated and attained all his Greek culture. The total absence of sentiment in the case of his own place of education, and its omnipotence in the case of the adopted home of his son's tutor, is a curious piece of psychology. At all events, I hope the passage will be brought under the notice of King Koffee, who is said to have asked for an English

tutor to educate his son. Again (p. 470): "*Service in the pay of Persia was made (by Philip) penal as treason against the Hellenic nation, &c.*" Thus, Philip's office of commander-in-chief abolished the state autonomy and the *personal liberty* of the Greeks in the most material points." This is nonsense. (Cf. pp. 459 and 468 for other such cases.)

But enough of detail. It is plain from what I have said that as a political historian of Greece Curtius is quite untrustworthy. As an archaeologist and as an artistic and literary critic he is generally very good and suggestive. The poorest passage of this kind in his book is the sketch of Theopompus and Ephorus (vol. v., pp. 176–8), which is quite pointless, and based, strange to say, not on the labours of Carl Müller, but of the antiquated Mure. I must protest, too, against the modern fashion (which Grote has inaugurated) of ending Greek history before its proper termination. Curtius will not even condescend to discuss Alexander, not to say the end of Demosthenes' life, his condemnation for embezzlement, &c., and the remarkable federal development of Achaia. In the *History of Greece* these things ought to find place, and modern authors have no right to fix a limit according to their own fancies.

As to Mr. Ward's share in the work, it may fairly be objected to its form, that while the translation is far larger in shape and dearer in price than the original,* and is inflated into five thick volumes; nevertheless, the English reader has got nothing more for his outlay—not a map, not an additional note or comment, nay, not even the notes of the third German edition. This is driving a hard bargain with us, perhaps on the publisher's part, if not on the translator's.

As to matter, Mr. Ward's translation is good and faithful, often so faithful that the German shines through the English almost amusingly. Indeed, his English, if I may venture to criticise it, seems a little debauched by constant study of German, and in many places, where I have no doubt of his understanding the original, he has conveyed it very strangely. Here are some specimens of these various features: *Riddled* (p. 29, &c.) is not any known form of *to rid*. *Bestial indulgence* (p. 42) is far too strong for *Völlerei*, and gives a dark colour to the passage never intended by the author. *Mächtig* is rather *powerful*, than *mighty* (p. 46). Again, the very idiomatic "*Schmerzenskind der attischen Seepolitik*" is amusingly translated (p. 47), "the source of so much grief to its parent, the maritime policy of Athens." *Morally over-indulged* (p. 85) is a curious description of Timotheus. *Body-physician* is equally curious for *Leibarzt* (p. 178), so *unblessed demagogues* for *unseligen Demagogen*, and "his was an *idealising nature*" for *ideale Natur* (ideal character), said of the orator Lykurgus (p. 346), about whom, as about many other things and people, Curtius is surprisingly

well-informed—how, I know not. But these are trifles.

The general index seems fairly executed, though the two kinds of *Logographi* should have been distinguished, if not in the text, all the more in the index; again, the Samian share in the treason at Zankle is not mentioned, nor is the prosecution of the aged Thucydides (whoever he was), under their respective heads.

In spite of these defects the work is a material and important contribution to Greek history, and as such will take its place in every classical library.

J. P. MAHAFFY.

Essays and Addresses by Professors and Lecturers of the Owens College, Manchester. (London: Macmillan & Co., 1874.)

A SHORT time ago there was noticed in this journal a Report containing the views of the various Oxford Professors upon the present condition of their studies at the University, and their recommendations with regard to the future of their Chairs. To that Report this volume of Essays presents in many respects a remarkable contrast. It is notorious that the Oxford Professors have in too many cases yielded to the seductions of their dignified position, and done but little to advance or teach the subjects they represent, and are now looking merely to an improved machinery of tuition to realise the proper objects of a professoriate. At Owens College, on the other hand, not only are the teachers highly distinguished in the dissemination of knowledge and in the paths of original research, but in this volume we find them coming forward as a collective body to challenge public criticism upon the manner in which they perform their high functions.

These Essays are published in commemoration of the opening of the new college buildings in the autumn of last year: a date which suggests the great things which can be performed in a short time by the fresh energy of voluntary effort, for it is little more than twenty years since the College was founded under the will of the late John Owens, of Manchester, merchant. Proposals have occasionally found their way into the public press advocating the affiliation of this College to the ancient Universities, but its students have as yet been happily preserved both from the many demoralising influences of Oxford and Cambridge life, as well as from the increasing stringency of those competitive examinations which threaten to pervert the entire spirit with which the pursuit of knowledge ought to be conducted. This book also will go far to reveal to the public how great are the advantages of an independent centre of the higher education, where the teachers, if not the students, will be more industrious, more open to new modes of thought, and in a nearer, and therefore more wholesome, connexion with the outside world, than if the new institution were inserted somewhere patchwise in the old system.

The volume opens with a very sound address delivered by the Duke of Devonshire, the President of the College, perhaps the most distinguished, though certainly not the most prominent nobleman in England: to

* The price of the handy and well-printed original is about 14s., that of the unwieldy translation 4l. 4s., a most unwarrantable difference, which should be protested against.

whom the cause of scientific progress owes a heavy debt, both for his services as Chancellor of the University of Cambridge, and as Chairman of the Royal Commission on the Advancement of Science. Next comes a sort of inaugural lecture by Mr. Greenwood, the Principal and Professor of Greek, "On some Relations of Culture to Practical Life." This heading is to a certain extent misleading, for the lecture is in substance a justification of academic education, and an attempt to assign their due place to Letters, Mathematics, and Physical Science. It was apparently intended rather for oral delivery than for subsequent publication, but is both thoughtful and eloquent. It contains a strong warning against the leading dangers of modern education—the tendency to regard success in a competitive examination as an end desirable in itself, and the spirit of ill-regulated self-seeking which marks the cleverness of the present day. Mr. Greenwood holds fairly enough the balance between the Classics and the Sciences, though it is surprising to notice how little he says on the subject-matter of his own Chair; and his scheme of education would appear to depreciate unduly the important subjects of Philosophy and History. The remainder of the volume contains fourteen essays by various professors or lecturers of Owens College, each on their special department; and of these exactly one-half, and that the first half, are devoted to the physical sciences. It would be absurd to suppose that all of these fourteen essays contain original contributions to knowledge, or even that they are all of equal merit; yet it may be doubted whether so much suggestive writing by so many minds of a high order has ever been collected in so small a compass elsewhere than in Germany.

The essay by Professor W. C. Williamson is perhaps the most original in its attempt, and the most elaborate in its details. He has here undertaken the task of reviewing the whole of *primaeva* vegetation as preserved in the record of geology, with the object of ascertaining the evidence that may be thence gained with reference to the doctrines of natural selection and evolution. It has always been known that the study of palaeontology does not appear to favour Mr. Darwin's celebrated hypothesis, and both Mr. Darwin and Mr. Herbert Spencer, while admitting this difficulty, throw themselves for explanation upon the mutilated state in which the leaves of the geological book have come down to us. Professor Williamson shows with great learning and great clearness exactly what are the facts, so far as at present known, with regard to the condition of the vegetable kingdom in each of the past geological epochs in which any vegetable life is found; and he establishes conclusively that the orders of this natural kingdom have not gradually succeeded one another in time, according to their hierarchical classification, but that different orders flourished abundantly and almost exclusively at different epochs, quite independently of any regular plan of evolution of higher from lower forms; and, what is of more importance, that absolutely no traces whatever are to be discovered of the gradations which the Darwinian

theory demands, through which one genus, or group, or order, should pass by help of a variety into another. From all this it by no means follows that Professor Williamson is not an evolutionist, for as to that question he does not in this essay pronounce himself, but concludes with one of those emotional panegyrics upon the impersonal unknown, which are becoming so common with English men of science.

The essay that follows is by Professor Gamgee, upon "Science and Medicine," a most attractive subject, which he has elected to treat by the historical method; and consequently has been compelled, by the necessities of the space allotted to him, to confine himself to a mere sketch; a circumstance which is not so great a misfortune in this case as with some of the other contributions, for the candid critic must admit that he has totally failed to grasp the question he has set himself. It is scarcely credible that a professor of physiology should so far misunderstand the meaning of the leading terms in his subject, as to commence an essay with the statement that "Medicine is an art which has long striven, and is now striving more vigorously and more successfully than ever, to reach the position which will entitle it to a place among the sciences." This hopeless confusion of the fundamental distinction between science and art, from which Professor Gamgee might have been preserved by the slightest tincture of Greek philosophy, or even by an elementary acquaintance with Mill's *Logic*, is proved to be not a mere verbal inconsistency by the course of the remainder of the essay, in which he indicates, with a certain amount of historical learning, the chief periods of progress in the sciences of human physiology and anatomy, but fails to notice that these periods have not been necessarily synchronous with the presence of great physicians and great surgeons; and, moreover, he has not hazarded the assertion that surgery is in process of becoming a science. The truth is, that medicine is a misleading term, and that Professor Gamgee has fallen into the common error of confusing the art of Therapeutics with the science of Pathology. It is true that any great advance in the latter is rapidly utilised for the purposes of the practitioner; but yet the perfection of the art can be attained, now as ever, only after vast clinical experience, assisted in many instances by what we call mere accident.

Professor Roscoe contributes an essay upon "Original Research as a means of Education," written in that admirably lucid and nervous style which characterises the productions of the great popular teachers of science in this country. His arguments and illustrations will be found very useful at the present day for those who are interested in the cause of University reform, though his vigorous language may seem to be occasionally overcoloured by a not unnatural antipathy to the old-fashioned subjects of education, and the mode in which they have been taught. Professor Reynolds gives us an essay on the Use of Steam, in which he very rightly draws attention to the deplorable lack of economy with which all steam-engines are used in this country, a circum-

stance which is perhaps to be explained, and certainly may be exemplified, by the prodigal waste which characterises nearly all the domestic operations of the Anglo-Saxon. The early portion of his essay, where he mentions the incalculable advantages which have flowed from the invention of the steam-engine to the human race, is rather weakly expressed. For example, it is surely only a small aspect of the real truth to say that "in Great Britain at the present time steam is doing as much work as twelve millions of men could do. . . . Thus it is doubling our working power, or doing as much work for us as we could do for ourselves." Doubtless this estimate is tolerably accurate if we merely regard the horse-power of the engines in use, but it seems to ignore the peculiar value of steam machinery, by which enormous power is concentrated and applied with extreme delicacy to the greatest variety of purposes, so that one locomotive, or one Walter press, can perform in a day what would more than consume the lives of twelve millions of naked labourers. Professor Reynolds, however, amply atones for this shortcoming by the charming manner in which he discusses, and does not repudiate, the possibility of constructing and turning to profitable use a "steam bird."

In the remaining essays on scientific subjects, Professor Core, writing on "The Distance of the Sun from the Earth," gives a very succinct account of the past and present condition of knowledge on that important question, which is of peculiar interest in the present year; while Professors Balfour Stewart and Boyd Dawkins have each chosen subjects which have reference to the results gained from the study of the heavenly bodies by means of spectrum analysis. The object of both essays is to present in a definite form the wonderful conclusions which this branch of research, so active at the present time in England, has already secured with regard to the constitution of the sun and the planets; and from the extreme attractiveness which attends the subject, and from the masterly way in which it is treated, they will to many readers appear the most interesting portion of this volume. The positive achievements of modern science, and its manifest tendencies, are here to be seen in a concrete shape, and scientific minds reveal themselves engaged in their actual work, of conquering new realms of knowledge, and maintaining the honour of this island.

Scant space is left for adequate remarks upon the other division of essays, which can only be described as not dealing with physical science. They are placed in the latter pages of the book, not assuredly because they are not of an equally high character with the others, but because physical science has, especially at Owens College, gained a position from its essential importance, and from the harmonious activity with which all its branches are pursued, which will not permit it to take the second place. A wide variety of subjects is treated of in this second division of essays, ranging from Oriental and Modern Languages to the Judicature Act and the Peace of Europe, and there is a stamp of individuality in the work of each writer. It is, however, much to be regretted that this volume, which claims to be repre-

representative of the education given at Owens College, should contain no paper on either of the two great classical languages, or on any of the departments of Philosophy, or on Logic, or on History. Whereas it is stated in the President's opening address, that "it was Mr. Owens' design to found a college in which instruction should be given in all the branches of knowledge which were taught at that time, or should thereafter be taught, in the English universities." It is true that there is a Professor of Greek, and another of Latin and Comparative Philology, and that the subjects of Logic, Mental and Moral Philosophy, and Political Economy, are all combined in one chair, most worthily occupied, if not entirely filled, by Mr. Stanley Jevons. But the Professor of Greek confines himself to a general discourse, illuminated certainly with the true light of Hellenic culture; Professor A. S. Wilkins gives an admirable sketch of the pre-historic condition of the Indo-Germanic peoples; while Professor Jevons attacks with characteristic energy the modern proposal that the State should acquire the railways. We cannot but think it significant that these three essays, though each excellent in their way, should be all that represents that large class of educational subjects which are the glory of the Oxford Classical School.

In conclusion, it remains to state that these criticisms are only drawn forth by the generally high character of this book. It is not perfect in every respect, but it forms an almost unique attempt to lay before the public the ripe attainments of a distinguished body of professors. It will greatly enhance the reputation of Owens College, and perhaps shame into greater activity some older and more wealthy institutions. It not only reflects credit upon the governing body which has had the skill to collect together and retain such eminent men, and upon the manufacturing city which has supplied them with a worthy home, but it also displays the strong fellow-feeling which has impelled these men to undertake the considerable labour of publishing a joint memorial of their industry and their talents.

JAS. S. COTTON.

History of England, from the Death of Edward the Confessor to the Death of King John. By Will. L. R. Cates. With an Introductory Sketch of the previous History, by the Rev. G. W. Cox, M.A. (London: Longmans & Co., 1874.)

THIS is a concise and useful summary of the period of history of which it treats, and may be recommended to the candidates for the University Local Examinations, for whose benefit it is apparently designed. The narrative is, generally speaking, both clear and accurate. The bearing and relative importance of the events described are rightly appreciated, and the estimates of the characters of the principal actors are just and discriminating. Like most epitomes, however, the book has the fault, especially to be avoided in a work intended for school use, of being somewhat deficient in interest. The characters are not invested with that life-like individuality which makes Mr.

Freeman's *Early English History*, for example, as fascinating as it is instructive to young and old alike. Down to the death of the Conqueror, Mr. Cates has made good use of both Mr. Freeman's larger and smaller Histories, and it is perhaps for this reason that the earlier portion of the volume appears to be the most satisfactory. It is true that such reigns as those of William's sons and grandson must necessarily seem tame and uninteresting when compared with the tremendous drama of Senlac, and the events that immediately preceded and followed it. But even when Mr. Cates has the opportunity of infusing a little warmth into his narrative, and of relieving with a few graphic touches the monotonous recital of contests for the crown and revolts of the barons, he does not avail himself of it so often as he might. If, for instance, instead of being dismissed in a few cold lines, the dramatic circumstances attending the nomination of Anselm to the primacy had been told in their simple details as found in the Chronicles, a far more vivid and lasting impression would probably have been made on a boy's mind; and he would have gained a clearer insight into the characters of the King and the Prelate, and the nature of the contest between them. Such considerations, however, must yield to the exigencies of space; and to the same cause may be due the fact that little or no attention is given to the social history of the time, the life and manners of the people as distinguished from the political acts of the sovereign.

Mr. Cox's brief Introductory Sketch does not call for much notice. It is mainly grounded upon Mr. Freeman; but, among other points of difference, Mr. Cox treats with something like contempt the alleged "commendation" of Scotland to Eadward the Elder in 924, as well as the story of the vassal kings rowing Eadgar's barge upon the Dee. Like Mr. Burton, he goes so far as to put them on a level as to historic truth with the Scotch tradition of the conquests of Grig the Great.

A few inaccuracies are not wanting. Among others, Eadward is twice given instead of Eadwig as the name of the son of Æthelred said to have been put to death by order of Cnut. For the statement that Stephen was about forty years of age in 1135, and died in his fiftieth year in 1154, Mr. Cates is responsible.

G. F. WARNER.

CURRENT LITERATURE.

Water Ways or Railways; or, the Future of India. What are we to do with the Hundred Millions? By Lieutenant-Colonel F. Tyrrell, M.R.I.A. (London: Edward Stanford, 1874.)

THIS little brochure undertakes to show the superiority of water-carriage, which can be combined with irrigation works on a large scale, over railway traffic for India. "The government of India for the benefit of the natives" is invariably the cry of these pamphleteers with Indian hobbies to ride, and Colonel Tyrrell is no exception to the rule. In the work before us he sets up the huge idol of the Indian railway system to knock him down again, morally, statistically, and financially. He considers that Indian railways were devised chiefly in the interests of the English firms which supplied the iron-work and other material used in their construction; that they have failed to

answer the expectations of their originators, as the tonnage transported by them is altogether insignificant in proportion to their mileage; and that, financially speaking, they are a failure. In their place a network of canals should have been spread over the country, and, with the blessings of irrigation thus extended, the Indian millennium would now have been at hand.

The picture of every man in India sitting contentedly under his own irrigated vine and fig tree is doubtless a pretty one, but (there is always a "but" in these pretty pictures) the first duty of the Government of India has been, and is, to secure the military and political safety of the vast empire committed to its charge; and until the main lines of the Indian railway system shall have been completed, this work is unfinished. In advocating the cause of canals against railways, Colonel Tyrrell entirely omits to take this aspect of the question into consideration. Ever since the Mutiny in 1857 it has been apparent, and never more so than within the last few years, that if we are to rule India to any good effect, a strong military government is absolutely necessary, both in our own behalf and for the best interests of the natives. Without it the empire would be in a constantly unsettled state; social order would cease in many places to exist, and the financial and commercial credit and prospects of the country would be seriously affected. The railway system is the most important element in the consolidation of our military power in India, and its completion, so far as the main lines are concerned, is of paramount importance. Its success as a commercial speculation is of secondary consequence; and this point is always evaded or lost sight of by the advocates of canals *versus* railways, who do not, however, we imagine, contend that the former offer more facilities for rapid concentration of troops and stores than the latter.

Colonel Tyrrell seems to think that the money (which he estimates at 30,000,000*l.*) spent by Government in procuring railway material from Europe has been misapplied, and that part of it, at any rate, should have been employed in opening local iron-smelting works and manufactories for the supply of these articles. This is another impracticable and catchpenny idea, put forth, we imagine, with the sole object of enlisting the sympathies of that not inconsiderable class of worthy people which imagines that common sense, foresight, and honesty are the very last qualities to be found in connexion with any work undertaken by Government. The rails and rolling-stock were required at once; but according to Colonel Tyrrell the Indian Government should have waited before procuring them until they could have been supplied locally—i. e., until sufficient iron mines had been opened, smelting works and manufactories established, and workmen instructed. Had any such wild scheme to introduce a new industry headlong into the country been attempted, and the supply of rails and rolling stock to Indian railways made contingent on its success, we venture to say that the journey from Calcutta to Bombay would occupy nearly as long to-day as it did twenty years ago. The subjects of water communication and irrigation in India are of very great importance; and now that the railway system is nearly completed, the Government will doubtless direct its attention to these points to a greater extent than has hitherto been the case; but we object to the misrepresentations of these pamphleteers, who omit the arguments on the adverse side of their case in order to give strength to their own crude and ill-digested ideas and theories.

MR. JOHN JENKINS has had a very good idea; but he has not been able to carry it out. We all know that there is a large vernacular poetical literature in Wales, and we should like to be able to form an opinion of it without learning Welsh; but original album verses, which are included in large quantities in this collection, issued by Price

of *Idanidloes*, are no help to this, and eighteenth century translations utterly devoid of local colour are no help either. We see it is intended to issue the book in a more ornamental form; when this is done, care should be taken that every translation is in the metre of the original, and that in nine cases out of ten a literal prose translation should be given too. If this test seems too severe, it will be natural to conclude that Welsh poetry consists of nothing better than displays of metrical dexterity in a sonorous language.

Songs and Fables. By W. J. M. Rankine. (Maclehose.) Most of the songs are upon the level of mere geniality which Scotchmen seem to have an unlimited faculty for enjoying. "The Darling Young Fellow" and "The Handsomest Man in the Room" are very tolerable echoes of *Praed*, and "The Mathematician in Love" and "The Infant Metaphysician" are equally amusing, and more original. The fables are wilfully and so comically platitudinarian in the style of the worst abridgements of *Aesop*; they give legends of twelve old signs. J. B. (Mrs. Hugh Blackburn) has supplied quaint and airy pencil sketches to illustrate ten of them.

A Tale of Ages. By R. Richardson. (Edinburgh: Edmonston & Douglas, 1874.) The secretary of the Geological Society of Edinburgh has tried to write the geological history of the neighbourhood, from the period of *Chaos* to that of the *Paris Commune*, in verse, with appropriate reflections and digressions: the result is something which an admirer might compare to a bad imitation of Robert Montgomery, though on the whole it is more like an overgrown abortive *Newdegate*.

The Last Day, and other Poems. By J. Battersby. (London: Ward, Lock & Tyler, 1874.) Mr. Battersby when he comes nearest to being individual, *Byronises* as one born out of due time: *Byronic* excitement working on an organisation less fine than *Byron's* results in a lawlessness in matters of metre, and sometimes of grammar, that exceeds *Byron's*.

Maimoc, Erelene, &c. (London: Pickering, 1874.) The two longer poems which give their name to the volume are the records of reveries which an intenser vision might have developed into poetical tales; the short poems at the end are colourless.

Popular Errors concerning Politics and Religion. By Lord Robert Montague. (London: Burns, Oates & Co., 1874.) Lord Robert Montagu's book is founded on an Italian work of a Piedmontese priest published in 1858, and a sort of Italian wordiness infects even the passages added by the noble author with reference to more recent events. The book is a good specimen of its class: if there were an objective standard of plausibility, it would be very plausible indeed, for the writer quite makes out that the whole course of anti-clerical liberalism is condemned by scores of beliefs which most anti-clerical liberals would find it still a painful effort to discard. As it is, the only use of such books is to prove, first, that we can expect very little of a world where the majority change their opinions on all important subjects in such an inconsiderate way; secondly, that the devotees of a faith which is losing ground should abstain from voluble and conciliatory expostulation: unless they can write in vitriol like M. Veuillot, they should take refuge in angelic silence.

The First Chronicle of Aescendune. By A. D. Crake. (London: Rivingtons, 1874.) The first *Chronicle of Aescendune* treats of a Mercian family in the time of St. Dunstan; the second is to treat of the time of Canute, and so on. Mr. Crake seems to have taken *Bekker's Gallus* and Dr. Farrer's *Eric* as his models. If his tale is not so instructive as *Gallus*, or so interesting as *Eric*, he may plead that it is less tedious than the one, and less mawkish than the other.

Essays Critical and Narrative. By W. Forsyth. (London: Longmans & Co., 1874.) Mr. Forsyth

is unmistakably "accomplished" in the old sense of the word; both in form and substance he has made the most of his mind that could be made, and he succeeds in this way in being instructive, and not being dull. The articles on "Legal History," the "Mont Cenis Tunnel" and the "Hudson's Bay Company" give a great deal of information well which it would be troublesome to get elsewhere. That upon *Literary Style*, when it was new, would have helped most readers to attend to what they read, and draw inferences from it. The article on "Mr. Foss's *Judges of England*" is a model review. The author's points are all marked, and often capped, and the whole is enlivened with rather harsh, but not undeserved jests at poor Lord Campbell, whose habit of setting down his impressions when he had forgotten his authorities, is taken as evidence for a much livelier imagination than he possessed. Perhaps the reason of the injustice is that Mr. Forsyth has not much imagination himself. In the paper on Cobbett he entirely misses the principle of Cobbett's life—to which he always adhered, though his imperfect education made him waver in its application—the principle of testing all political systems and measures by their bearing on the concrete individual well-being of the majority of common people, who may very possibly have interests at variance with those of the community as a whole, if we regard the maximum of aggregate wealth, or power, or enlightenment, as the interest of the whole community. Cobbett's treatment of the Reformation, for which Mr. Forsyth makes needless apologies, is a good illustration of this. He saw that the Reformation was not made by the common people, or for the common people, and as he only knew enough to choose between the legend of Parsons and the legend of Burnet and Foxe, he took the one which suited this broad fact. The same want of imagination makes the noticeable paper on an Election under the French Empire less suggestive than it might have been if it had occurred to the author to discuss the very plausible theory of the prefect, that in a country like France it was a plain civic duty for electors to support the Government at the polls, while they approved of it. It is still more surprising that the author should reprint in 1874 the telling indictment against the gross diplomatic irregularities of King Victor Emmanuel which he drew up in 1861, with no comment, except that his forebodings have been gloriously falsified by the event. He gives the numbers of the plebiscite which ratified the annexation of Naples—Yes, 1,302,064; No, 10,312. They have less moral authority than even the plebiscites of the Second Empire.

EDITOR.

NOTES AND NEWS.

It is reported that Prince George of Prussia, under the *nom de plume* of G. Conrad, has written a drama, which is being published by Messrs. Otto Gülder and Co. at Berlin, and will bear the title, *Elfrida von Monte Salerno*.

THE *République de la Loire* contradicts the statement that Jules Janin has bequeathed his library to the town of St. Etienne. It gives the will of the distinguished critic as follows:—

"J'institute ma bien-aimée femme ma légataire universelle."

The truth is, according to the *Débats*, that M^{me}. Janin, while retaining the library during her own life, has signified to the French Academy her intention of bequeathing it to that august body.

A SHORT notice of the great critic in the *Nation* gives the following story, the truth of which is vouched for by the writer:—"In 1851, Janin was sent over to London as correspondent of a Parisian journal for the purpose of describing the Great Exhibition. The Exhibition did not wholly engage his mind, and by times he employed his valuable hours in philosophising on the character of the

English, and despatching the results of his observation and meditations to the editor at home. One of these precious results was that, going into the City, he saw on the front of the Royal Exchange an inscription, which read, 'The Earth is the Lord's,' and which he at once transferred into his note-book. There it appeared as 'La terre est aux Seigneurs,' and such was the translation forwarded to the French nation by our journalist. In other words, says Jules, you may see by this that not even the merchant prince of the English can free himself from a degrading subserviency to the aristocracy—to the House of Lords."

MICHELET's library was sold at the Hôtel Drouot on the 7th instant. It comprised about 3,000 volumes, chiefly historical works, and a collection of unpublished documents bearing on the history of France. There are, also, a good many modern books on geology and natural history.

MESSRS. LONGMANS announce as in the press Mr. S. R. Gardiner's *History of England under the Duke of Buckingham and Charles I.* The book is intended to trace the causes of the estrangement between the King and the nation, from which all the subsequent evils flowed. He rejects the notion that the King was in any way lukewarm about the recovery of the Palatinate, and finds the first difference of opinion arising in the Parliament of 1624, when Charles, together with his father and their favourite minister, looked with favour upon a continental war waged with the help of France, an idea which did not commend itself to the House of Commons. When once this difference of opinion had arisen, many other differences came to complicate the issue. With the help of a very large number of hitherto unused documents, the author has attempted to trace the progress of the strife, so as to show, not what the House of Commons thought that Charles had done, but what he really did, so as to afford for the first time the means of judging fairly between the parties to the conflict. The book ends with the murder of Buckingham and the surrender of Rochelle, a point at which the opposition to the military and naval proceedings of the King is at an end, and the Church questions come to the front. The session of 1629 may be more fairly treated of in connexion with the days of Laud and Strafford, than in connexion with the days of Buckingham.

THE present number of the *Revue des Deux Mondes* contains three chapters from the *Histoire de la Guerre Civile en Amérique* by the Count of Paris. They treat of the army of the United States prior to the outbreak of the war, and of the system of slavery, in which the author justly perceives the real cause of the war, setting aside, as far as can be judged from the present fragment, those constitutional questions which were only raised to temporary importance by the real question at issue. The Count of Paris informs us that the book will in the main be occupied with military events of the war, for writing which, as is well known, he possesses special qualifications. It would not be fair to judge the political part of the book from a mere sample. But it may be doubted whether our knowledge is helped by hearing the events which ushered in the war described as a *coup d'état*. No doubt there was a certain similarity, as there was a certain similarity in Mommsen's mind when he spoke of the party of the *optimates* at Rome as a *Junkerpartei*. But in all these cases the danger is that the reader dwells on the similarity, and forgets the no less important difference.

The first two volumes of this work, which will be completed in seven volumes, were published on Wednesday last by Messrs. Michel Lévy Frères.

MARGARETHA WULF, the well-known Slesvig-Holstein authoress of various tales for young persons, died recently at Slesvig, at the advanced age of eighty-five. Frau Wulf was, perhaps, best known under her *nom de plume* of Anna Stein.

THE Swedish Master of the Rolls, Dr. Hildebrand, has visited the famous mounds of Old Upsala, to see that the ancient graves are in readiness for the visit which is to be paid them in August by the Archaeological Congress.

A FEW weeks ago we announced the death of the Danish political writer, Nathan David. A man no less famous in his day, and a constant opposer of David, A. F. Tscherning, died on June 29. Tscherning, who was one of the most influential journalists of his day, was born in 1796.

ELLAS SEHLSTEDT, a Swedish poet, whose fresh and pure songs have won him a great popularity, died at Stockholm on June 22. He was born in 1808. The Swedish physicist, Professor Ångström, is also dead.

THE best book published this year in the North seems, without doubt, to be *Lodsen og hans Hustru* (The Pilot and his Wife), a new novel by the Norwegian poet, Jonas Lie. The name of this writer is still comparatively unfamiliar, but the Scandinavian critics are unanimous in deciding that this new work puts him on a level with Ibsen and Bjørnsen, that is, in a very high literary position as regards, not Norway only, but contemporary Europe. Lie has written carefully and without undue haste. Born in 1833, he became first known by a little novelette, entitled *Der Fremsynde* (The Man with the Second Sight), a slight and sketchy, but very original and fascinating study of the strange, perilous life upon the Arctic coast of Norway. Since then he has advanced surely, though without any precocious celerity, and the new work seems at last to proclaim without any fear of denial that here we have a new and powerful writer whose great individuality and originality are under the control of a healthy artistic sense. We hope to have an opportunity of reviewing *Lodsen og hans Hustru* at length, but we do not wait till then to express the cordial pleasure, mixed with the surprise that is one of the privileges of fresh genius, with which we have read it. The poet has been living in Rome, and there this, like so much good Norwegian literature, was composed. By the way, we hear that Bjørnsen, who is also in Rome, has finished several tragedies. Perhaps this is only like the periodic rumour that used to augment the "gossip" of a respected contemporary, to the effect that Mr. Swinburne was engaged in writing several novels.

M. ALFRED RAMBAUD has contributed to the current number of the *Revue des Deux Mondes* an interesting article on the *bylinas* or metrical romances of Russia. After giving a brief account of the various collectors of these scattered fragments of Russian epic poetry, he proceeds to analyse the principal stories which the *bylinas* relate—the legends of Ilya the rustic, and of Dobrynia the courtly, and of Aliosha the perfidious, and of all the other heroes who circle around the "Fair Sun," Vladimir, Prince of Kiev, as well as of the somewhat singular heroines who own them as their lords. In conclusion, he mentions the various ideas current among Russian scholars with regard to the origin and signification of these rather incomprehensible narratives, giving the preference, apparently, to the views maintained by M. Orest Miller, and holding that the heroes of the *bylinas* are for the most part solar beings. "Les données naturalistes, communes à tous les peuples de notre famille, ont fini vers le xi^e siècle par se spécialiser, par se naturaliser slaves."

THE *Nation* gives some statistics which tend to show a remarkable growth of expenditure, as compared with receipts, at Yale College. In 1834 the average cost of each student graduated was 234 dols. 92 c., and the average amount returned by him for tuition was 160 dols., or 68 per cent. In 1873 these figures had become respectively 757 dols. 44 c. and 418 dols., the percentage being reduced to 55. Or, again, considered by decades, the proportion of receipts to outlays has been suc-

cessively 60, 57, 54, and 50 per cent. The same tendency is observable at Harvard, but no statistics have been published. It is stated, however, that in 1868 the expenditures of the Academical Department were 95,440 dols. 24 c., while the amount charged in term bills was 49,758 dols. 30 c., or but little more than 52 per cent. of the former.

TRÜBNER's *Monthly Record* gives some information with regard to the steps that have been taken in China,

"to make good the literary losses entailed through the ravages of the Taiping rebels. At more than half the great literary centres, formerly renowned for their printing establishments and their treasures, the most wanton destruction was perpetrated by the insurgents. . . . With that laudable reverence for their own literature, which shines as a redeeming feature amidst the corruption of Chinese officials, solicitude was very early displayed by the high provincial functionaries . . . for the restoration of supplies of the standard literature of the country."

Kwan-Wen, Governor-General of Hukwang, was the leader in the movement, and he organised a committee at Wu-chang for the purpose of "reproducing the classical or canonical works, the national histories, the treatises of the schoolmen and critics, . . . and also sundry modern works of a miscellaneous character." Among the varied and numerous publications of this committee may be mentioned,

"An Atlas of the Chinese Empire, in thirty thin volumes, drawn up under the patronage of the Governor-General, and embodying all the geographical details derivable from the Jesuit surveys of the last century, in combination with the particulars yielded by purely native sources."

Operations of a similar nature, but on a smaller scale, are being carried out at Nanking.

ANY new fact about the architect of St. Paul's should have a little interest just now, so we may mention that among the state papers in the Record Office is a letter to Lord Arlington from Sir John Denham, still remembered for his poem of *Cooper's Hill*, recommending "Dr. Christopher Wren" as his deputy in the office of Surveyor-General of Public Works. This letter is dated March 5, 1668-9, and is also worthy of notice in that it corrects the statement of most of Denham's biographers that he died in March 1668; the proper date should be of course a year later. Wren succeeded him in his appointment.

THE following portion of an unpublished manuscript diary in the British Museum, recording a visitor's experiences of London sight-seeing in 1772, is chiefly worth drawing attention to at the present moment from the interesting glimpse it gives us of the artistic treasures stored in the doomed Northumberland House. The date of the entry is August 27 in that year:—

"At the bottom of Buckingham Street I surveyed the only ruin of York Buildings, which is the wharf; from there is a passage to the wooden tower which supplies a great part of Westminster with water. This fire-engine I had the curiosity to examine. Its construction is very simple and easy to be comprehended by an intelligent person, though seemingly intricate and complicated to the illiterate vulgar. 'Tis carried on merely by the force of steam, which putting in motion the several levers or handles of compounded pumps that raise the cold water, falls down itself in the form of hot water, and through conducting tubes is discharged into the Thames.

"Not far from hence is the famous mansion of the Duke of Northumberland, one of our late Irish Viceroy's, but formerly a Palace belonging to the Percy family so much renowned in the honoured Records of Chevy-Chace. At my entrance into the first apartment I had the good fortune to be introduced to the ancient Dukes of Northumberland, & Somerset, to squire Thynne who was cut off by some assassins of Count Koningsmark, & to several other family pictures which are not very material to record. In the next room are many capital pictures by the first Masters—particularly old Cornaro & his family at mass, drawn by Titian, Venus asleep by Correggio,

over the door, a brother painter on horseback, a very spirited Piece by Vanduyke, a Nymph pulling a thorn out of her Mistress's Foot by Raphael, and Venus stealing an arrow from Cupid's quiver by Rubens. Ixion on the Wheel most excellently painted by a Venetian nobleman, Duke Cosmo de Medicis dictating to his secretary, by Titian. A Cabinet of Pictures consisting of 12 groups painted by old Franks with his own portrait in the midst; this valuable piece is said to be (*sic*) in the collection of King Charles the First. The Ball Room is exceedingly elegant & grand, sufficient to entertain 800 people. The ceiling is finished with the most beautiful stucco in several compartments by Frankini, and the chimney pieces executed in the finest marble by Ricards. The mantle pieces are highly ornamented, and seemingly supported by human figures at full length highly relieved, whilst three large brilliant Glass-Branches enlighten the whole Assembly. But what gives a greater idea of grandeur than all the rest are 4 large capital paintings, that cover completely $\frac{3}{4}$ ths of this magnificent saloon, which were copied from the best pictures in the Vatican of Rome, by Pompeo de Batoni and Mings, two excellent modern masters; which cost the Duke an immense sum. The first of those pieces is the Triumph of Bacchus, the 2nd is the School of Athens, the 3rd the Feast of the Gods, and the 4th is Aurora."

SUCH LIKE matters of literary and artistic interest occasionally reveal themselves, mixed up with grave political subjects, to the student of these "unsunned treasures," as the elder D'Israeli styled the state papers. Here, for instance, is a curious little addition to the history of the distresses of learning and authorship furnished us by the worthy John Evelyn, in a letter to Joseph Williamson, Under Secretary of State:—

16: 9th: 68.

Sr

I did intend when I had a fit opportunity *et molle tempus fandi*, to bespeak y^r favour in behalfe of a friend of mine. It was told me the Historiographers place was void since the decease of Ja. Howell. For God's love, if there be a subsistence or solid honorary appendant to it, reserve y^r good word for that able and worthy person I lately recommended to you: It is Chr: Wase, formerly of Kings Coll: in Camb: which fellowship he lost for refusing the Engagement. The poor man is at present Schole-M^r of the Free-Schule at Tunbridge, where his incomparable parts are obscur'd and depress'd, and the miserable creature plow'd for 40^l. a yeare which does not afford him bread. To render you a specimen of his universal abilities. You either have, or ought to have seen his version of *Hugh Grotius's Catechisme* into Greeke verse in which tongue he is competitor, if not superior, to any of this age: & out of Greeke into English, his admirable translation of *Sophocles's Electra*, for which loyal poem he suffer'd greates persecution: Out of latine, you have old Gratius's *Cynegilicon*, or Poeme of Hunting, with his critical and historical notes upon all these three Authors: His talent in the Latine tongue, and knowledge of Universal History, you will find in a large Preface to *Dictionary minius*, worthy y^r perusal; This preface contains more good matter in it, than many large and enormous Volumes: With all these excellent parts, he is of a most innocent, sincere and humble frame of mind; infinitely modest and sedulous: His style is nervous and material, but quick; and he is furnish'd to adorne it with all the advantages of his learning, which is, I assure you, of the most refined: you will also have one ready to drudge for you in the most Herculean labours of the Pen upon any other occasion of putting things into Latine; and all this without ever owning his merites, but with the greatest submissions and deferences imaginable: In one word, I will stand or fall in your good opinion concerning me for ever, if this person do not make good to the utmost, what I promise so largely in his behalfe, and I do sweare to you, without his knowledge or seeking.

Deare Sr, For all the favours I have hitherto receiv'd from you, be once oblig'd; 'tis an Insolent word, but I say it againe, Be once oblig'd by

Sr Y^r most humble
and most obedient Servant,

J. EVELYN.

Sr, I may not omitt to tell you, y^t he has travel'd France and the Low Countries: that he is skil'd in all

the learned Oriental tongues; and was once compiling the History of Languages. I know not what he wants to qualify him equal to y^e ablest Writers of this Age, but his Ma^{ty} favour, to give him bread & encouragement, that he may intirely vacate to his service, and begin to take off the reproaches we lye under, from the Dutch and French scribblers, who yet poyson all Europ with their monstrous Relations, & pernicious pamphlets."

We have dipped into Evelyn's *Diary*, in the expectation of again meeting with the first Greek scholar of his age, and have not been disappointed. Wase appears to have been many years under Evelyn's protection, for so early as February, 1652, we read:—

"I brought with me Mr. Christopher Wase sometime before made to resign his fellowship in King's College, Cambridge, because he would not take the Covenant. He had been a soldier in Flanders, and came miserable to Paris. From his excellent learning, and some relation he had to Sir R. Browne, I bore his charges into England, and clad and provided for him, till he should find some better condition; and he was worthy of it."

On May 30 he writes:—

"I went to obtain of my Lord Devonshire that my nephew George might be brought up with my young Lord his son, to whom I was recommending Mr. Wase."

No further mention of him is to be found until a few months after the date of the above letter, thus:—

"March 16, 1668/9.—To London, to place Mr. Christopher Wase about my Lord Arlington;"

and on April 2:—

"I now placed Mr. Wase with Mr. Williamson, secretary to the Secretary of State, and Clerk of the Papers."

Unfortunately for the chance of Evelyn's learned friend, Dryden had recently burst into fame with his *Annus Mirabilis*, a poem which was the chief means of getting him the appointments of Poet Laureate and Historiographer Royal, both at the same time. We have nothing more to record of Wase, "that eminent philologist," as Hearne calls him, except that he died in August, 1690.

THE death is announced of Archdeacon Churton, at the age of seventy-four. He was known as the author of the *Cleveland Psalter*, the *History of the Early English Church*, and of an *Historical and Critical History of the Age of Philip III. and IV. of Spain*.

HALLBERGER'S *édition de luxe* of Shakspeare's collected works in German has now reached the fifth volume, which contains *Antony and Cleopatra*, admirably translated by Paul Heyse, who also supplies the interesting introductory remarks which form the preface to the piece. The *Othello*, with notes and preliminary remarks, which concludes the volume, is by F. Bodenstedt.

THE German papers report that the ceremony of unveiling the Hans Sachs monument passed off with great success at Nürnberg on June 23, in the midst of much mediæval masquerading and modern speech-making. The ceremonial ovations and trade processions culminated at the old Market-place of Nürnberg, where, in the presence of a large concourse of people, Hans Sachs' carnival-piece, the *Narrenschneiden*, was performed by members of some of the trade guilds, dressed in appropriate costumes; and numerous oak and laurel wreaths, both natural and metallic, were solemnly deposited, in the name of Shoemaker-associations from every part of Germany, at the feet of the statue which represents the immortal German poet and shoemaker, Hans Sachs. The monument, which was formally presented to the city of Nürnberg by the Committee of the Sachs Fund, is said to be admirable in design and execution, and is the work of the late lamented sculptor Krausser, who did not live to see the successful realisation of his composition.

M. ALFRED DE REUMONT is prosecuting his examination of Florentine archives, with a view of completing the history of Lorenzo the Magnificent, on which he has for some time been engaged.

THE fifth number of the *Bulletin de l'Académie Royale des Sciences, des Lettres, et des Beaux-Arts de Belgique*, contains a paper read by M. Wauters, giving many interesting particulars of the history of the early guilds of the Low Countries. In England, he says, these institutions flourished peaceably. In the Low Countries they had to maintain themselves against the hostility of the clergy and the kings of the Franks, as being favourable to drunkenness, or to designs against the State. But, in spite of opposition, they contrived to hold their ground. M. Vautier quotes from the statutes of several of these guilds evidence to show the part which they took in promoting a sense of mutual co-operation and self-restraint.

M. LOUANDRE, in the current number of the *Revue des Deux Mondes*, has an interesting article on "A State Prison under Louis XIV." The recently published archives of the Bastille show beyond all doubt that Fouquet, the famous intendant, was guilty of peculation on the most gigantic scale, at which even certain prefects of the Second Empire might stand aghast; that Racine, who narrowly escaped arrest on the charge of poisoning Mlle. du Parc, the most brilliant actress of Molière's troupe, was entirely guiltless of any share in the poisonings; and that, generally, State prisoners were treated not only without rigour, but with an almost lavish generosity. They might receive visits, and met at fixed hours to play at billiards and skittles. They had an excellent table provided, and were allowed three bottles of wine each a day, including one of champagne. Some prisoners took part of the allowance made for their keep in money; so that many left the Bastille richer than they had entered it, and some on being released begged for a longer confinement, for purposes of economy and retrenchment. Those who have not time to study the archives themselves, will do well to read this article, which contains a sketch of the ordinary procedure at the Bastille, and a detailed account of the great inquiry into the crimes of M^{me}. de Brinvilliers and her initiators, which took place in 1680. M. Louandre establishes a striking analogy between the age of Louis XIV., as recorded in these frightful annals, and Roman society of the decadence as it lives in the pages of Tacitus.

NOTES OF TRAVEL.

WE most gladly call attention to the excellent letter from Mr. Clements Markham, which has lately appeared in the columns of our daily contemporaries, in which he advocates the claims of Lieutenant Cameron, at present engaged in Central African exploration, upon the support of the public. The circumstances under which this brave young officer originally proceeded to East Africa are already sufficiently well known to our readers. He was sent out by the Royal Geographical Society to relieve Dr. Livingstone, and the Society supplied him with material aid until all the funds at their disposal for the purpose were completely exhausted. After Livingstone's death, Cameron, in the most plucky manner, pushed on by himself to Ujiji, where he has already made most valuable observations, and recovered much property belonging to Dr. Livingstone, and from whence, after he has made a complete tour of the lake, he intends pushing further to the west. For this purpose, however, he must have more funds. The Royal Geographical Society have done all they can in justice to the many other claims on them. Lieut. Cameron may be, and probably is, on the brink of valuable geographical discoveries. His pluck and fitness for the work he has undertaken are undeniable, and it would be sad indeed if he had to

return on the very threshold of success, paralysed by want of support from his countrymen at home. We must remember, too, that Stanley will be shortly on his footsteps supplied with everything that money and experience can provide or suggest; and we appeal to the sense of justice among Englishmen not to let Cameron have the mortification of seeing all the fruit and glory of his labours snatched from him at the last moment by another, because he is not able to prosecute them for want of funds. Stanley has already reaped laurels that should have fallen to Englishmen; and though we do not grudge him his well-earned reputation, we appeal to our readers to give Cameron, their own countryman, that present support which we believe is all that is needed for him to achieve a similar or even a greater success.

THE last news from Lieutenant Cameron, dated February 28, announced his intention of exploring the Tanganyika lake during March and April, and of then continuing his journey westward to the Lualaba. There is a subsequent rumour that Colonel Gordon had received intelligence of Lieutenant Cameron, as being engaged in the navigation of the lake. His observations for fixing the position of Ujiji and the height of the lake have already been received, and are extremely valuable. Previously the longitude of Ujiji depended on a single lunar observation by Captain Speke, with a star out of distance. Cameron certainly deserves the support of his countrymen in the execution of his difficult and important task.

WE regret to have to announce the death of Dr. Stoliczka, the geologist who accompanied Mr. Forsyth's mission to Kashgar, which took place at Shyok on the return journey. In this, his last service, he has achieved valuable results. A memoir on the geology of the mountain ranges which separate the Indus basin from Turkistan has already appeared; and in his subsequent excursion to the Pamir table-land, he made the important discovery of the existence of volcanic action in that region, which tends to confirm the hypothesis of Humboldt. Ferdinand Stoliczka was originally on the Austrian Geological Survey, and accompanied the *Novara* in her voyage round the world. He joined the Geological Survey of India, as palæontologist, in December 1862, and has since done much admirable work. His final illustrations of the cretaceous fauna of Southern India form the contents of the last issue of the *Palæontologia Indica*. The loss of this accomplished geologist will be long felt both by a wide circle of friends, and by the public service.

Two years ago, Captain John Moresby, in H.M.S. *Basilisk*, discovered that the eastern end of New Guinea contained a deep bay, and that there was a good navigable channel between the main land and a group of islands, which he named the China Strait, believing that it would form a shorter route between Australia and China. His father, the venerable Admiral of the Fleet, has just received a telegram from Captain Moresby, announcing his arrival in the *Basilisk* at Singapore, after completing his survey along the north-eastern coast of New Guinea. Captain Moresby comes of a surveying family. His father, Sir Fairfax Moresby, did useful work among the Seychelle Islands; and his uncle, Robert Moresby, of the East India Company's service, was the surveyor of the Red Sea, and of the Maldives. Lieutenant Dawson, of the abortive Livingstone Search Expedition, is attached to the *Basilisk* for surveying duties.

AN elaborate survey of Lake Ladoga was brought to a completion last year, and it is now proposed to erect lighthouses and place buoys and other marks to facilitate navigation thereon. A commission composed of delegates from the departments of Public Works and Finance, under the presidency of Admiral Yelanoi, is preparing a scheme for the transfer of the future management to the Minister of Marine.

M. FETISSOF, a gentleman of great experience in the cultivation of vines, has just been despatched

to Vernoye, Kuldja, and certain districts of the Semirechensk province of Russian Turkistan, with instructions to endeavour to effect a reform in the prevalent method of training vines. The grape ripens readily in this region, but it is rather sour and unsuited for the making of wine. This, however, M. Fétisoff contends is greatly due to the want of proper cultivation; and with the help of good vines from France he confidently hopes to improve the stock, and so enable wine to become a staple export of the country.

THE French Geographical Society and the syndical chambers of Paris have just formed a Commission of Commercial Geography, divided into four sections corresponding to the four great divisions of which the labours assigned to it are composed, viz.:—1. To render more common the knowledge of subjects connected with commercial geography, by means of public teaching and writing. 2. The exploration of commercial routes. 3. The cultivation and improvement of natural and industrial commodities utilisable in commerce and manufactures. 4. Colonisation. The decisions arrived at by each section will be submitted to the approval of the whole Commission. This latter, although it cannot, on principle, interest itself directly with any enterprises but those of public utility, will nevertheless occupy itself, within the extent of its means, with enterprises of private interest which would appear to be of sufficient importance generally to invite the intervention of commerce and industry.

PERE DAVID, the energetic Chinese missionary, who has enriched several of the French museums with valuable collections, has just returned home after this his third trip to China, having been absent a little more than sixteen months. He endeavoured to obtain permission from the Chinese Government to penetrate as far as Kuku-Nor and Northern Thibet, but he was refused a passport because of the presence of the Muhammadan troops in those regions. Nevertheless he started from Peking on October 2, 1872, hoping all the same to gain his object. A month later he reached Si-ngan-fu, the capital of Shensi, and for five months and a half he was occupied in exploring the Tsin-ling range. The fauna he found did not differ materially from that of Sz-chuen; and, as the troubles in Kansu did not admit of further progress westward, he embarked on the Han-kiang and arrived at Han-kow on June 8, 1873. In one of the numerous rapids of the Han-kiang river (the fall of which is about 1 in 6,000), he was unlucky enough to lose a large portion of his collections and baggage. David also explored the mountains east of Fokien, but he was by this time in such a wretched state of health, that it was with difficulty he managed to reach Shanghai in March last. Père David, accompanied by only two servants, has during this last journey explored about 800 leagues of country, and has brought home most interesting and valuable collections. Had his health not failed him so disastrously, there is little doubt he would have achieved even greater results.

We read in an Indian paper that the Rev. M. Marks, the well-known missionary at Mandalay, has been getting into trouble with the King of Burmah, who has ordered him to leave the kingdom; his Majesty stating at the same time that he would not be responsible should anything occur to him if he remained. The cause is attributed to a publication which appeared some years ago on Buddhism, which was translated to his Majesty, and at which his Majesty took offence. Mr. Marks, it is stated, nevertheless purposes remaining, and says he is under the protection of the British flag.

THE *Débats* states that Abbé Richard has returned from his travels in the East, where he has been occupied with the discovery of springs for the Turkish Government, and is now at Paris, where he will remain during the present year.

His method of discovering springs is based solely on geology.

Das Ausland (June 15 and 29) describes the customs and speech of the inhabitants of Kempen, or La Campine, in the Belgian province of Brabant. The writer says: "They speak the purest Flemish in the whole land," and preserve their ancient manners. On the Evening of the Three Kings (January 5), the eve of Ash Wednesday, and on Christmas Eve, the children sing carols, that for the first being:—

"Wy komen hier aen met onze sterro,
Wy zoeken den Heer, wy hadden hem geirn;
Sterre, gy moet er zoo stille niet stien,
Gy moet er met ons naer Bethleem ghen,
Naer Bethleem die schoone stad,
Waer Maria met haer klein Kindje zat."

The children carry a star of coloured paper, and the above, which is almost English, means literally, "We came here with our star; we seek the Lord, we have held him in gladness; star, you must not stand so still: you must with us to Bethlehem go, to Bethlehem the beautiful city, where Mary sits with her little child." When twelve o'clock strikes on Easter Eve, the house door and windows are opened by the servants, who strike them with brooms, calling out, "Easter come in: fast get out." They also keep up the custom of hiding Easter eggs. On Palm Sunday the peasants put palm twigs in their hats, and on Candlemas Day they drop a little wax upon them from a consecrated taper, and believe them to be charms against all ill-luck. In like manner a garland of St. John's wort (*Artemisia*), twined on June 24, and placed under the roof, or over the door, is thought to bring a blessing to the house. Many other curious customs and superstitions are mentioned in these papers.

It is announced from Yokohama that the Japanese Government, in order to show the falsity of European notions respecting their liberal reforms, "have just published a notification that the old notice-boards, defining the limits beyond which foreigners are not allowed to pass, and which have for years been allowed to fall into decay, have been re-erected."

THE announcement made last week in the columns of the *Daily Telegraph*, to the effect that that enterprising journal had, in conjunction with the *New York Herald*, determined on sending out Mr. Stanley to East Africa, with unlimited powers, and we presume unlimited credit, to prosecute a crusade against the slave trade, will certainly have taken many people by surprise. It is no part of our business to discuss in these columns the nature or value of the powers delegated to Mr. Stanley by the two well-known journals, whose names and titles are from henceforth to be synonymous with liberty and freedom in the ears of the benighted millions of Africa. We can but admire the pluck and the spirit which, from whatever reasons, commercial or otherwise, have given birth to this enterprise; and we most cordially express our belief that what human endurance, courage, and pertinacity can achieve will be achieved by its leader. But we must confess to seeing many difficulties in the way.

The plan of Mr. Stanley's procedure will probably be very similar to the one which he sketched forth in his speech at the anti-slavery meeting at Stafford House. We understand that the first object of the expedition will be to survey thoroughly the ports upon the coast from which slaves are shipped; and thence to penetrate into the interior and find out the depôts where slaves are collected and lodged prior to shipment; after these preliminaries, it is intended to proceed direct to Ujiji, cross Tanganyika, take up the line of Livingstone's last march, and finally to attempt to put down the slave trade by stopping the supply of slaves at its very source. It is unnecessary to point out that for this service a very large force will be required; and we hear that preparations

have already been made for the purchase of a big yawl, which shall be completely found in every respect, and which, with a competent crew, is destined for the exploration of the ports and rivers on the coast, and the destruction of the slave dhows found thereon. There is probably no parallel in the history of the press of journalistic enterprise ever having lent itself to so gigantic a scheme. That which successive governments and powers, special embassies, the navies of England, and the most solemn treaties have hitherto failed to effect, the *Daily Telegraph* and *New York Herald* now propose to achieve by the efforts of one man and the resources of a long purse. These two journals, in short, propose to take upon their shoulders the self-imposed burden of what should be an imperial responsibility. Before, however, attempting to express a decided opinion as to how far this enterprise is likely to succeed, and presuming that our estimate of its object is correct, we should wish for information on the following points:—How far is the Sultan of Zanzibar likely to lend himself to this unauthorised interference in a matter which has been but lately the subject of a special embassy between himself and the Government of England, and concerning which negotiations are still in progress? How does Mr. Stanley propose to make the requisite preparations on the coast, and raise the forces necessary to accompany him; and from what races will he recruit such forces should the Sultan prove unfavourable to his project? How will it be possible for him to prevent collision between himself in his self-authorised mission of exploring the slave ports on the coast, and Her Majesty's ships who already have had that duty confided to them? In what light will he be regarded by the Arabs against whose trade he is to make war? And, lastly, to what extent are his efforts to be countenanced by Her Majesty's Government at home, without whose silent connivance, at least, his mission, from its political aspect, can have no chance of success? These are difficulties which seem to lie on the very surface, and which are so real as to deserve the gravest considerations. If Mr. Stanley confines himself to geographical research alone, his previous exploits justify us in predicting for him a brilliant success. If he attempt the suppression of the slave trade, we can hope for nothing else than failure.

This enterprise should in any case have one immediate advantageous effect. It may be successful in rousing Parliament from the state of lethargy and supineness with regard to the East African slave trade in which it has so long remained, and which has had the effect of completely nullifying the effects of all past missions and treaties. This proposal to usurp a portion of Parliamentary duties and responsibilities may at last induce the Government from very shame to take some steps to redeem its oft-repeated pledges as to its determination to put down the slave trade. In that case, our debt of gratitude to the two journals will be large indeed, and the interests of geographical discovery can be safely left in Mr. Stanley's hands. We hear that a sum of 8,000*l.* has been placed to his credit for preliminary disbursements.

LITERARY ACTIVITY IN SPAIN.

THE continued publication of the *Revista de España* is assuredly a hopeful sign; but the important literary enterprise represented by the *Revista de la Universidad de Madrid** is a still clearer indication of intellectual activity in Spain. The Senate (*Clayastro General*) of the University of Madrid decided upon the publication of a scientific Review, on May 5, 1872; and the first number appeared in 1873. It is divided into two parts, the first containing articles by the various professors on their special subjects; and the

* *Revista de la Universidad de Madrid*. Numbers for 1873.

second being a sort of University Gazette. All articles must be signed by their authors; and the Rector is *ex officio* editor, aided by a committee of seven professors.

The first number of the *University Review* opens with an Introduction by the Rector, Dr. Don José Moreno Nieto, who explains the scope and objects of the undertaking. Although all schools of thought and all opinions will be tolerated, it is distinctly laid down that the general tone of the contributions will indicate a belief in a personal Deity, and in the ordering of the universe by divine laws. Nevertheless, all serious thought of whatever school will be welcomed, and the work of all classes of thinkers will be received, so long as it is animated by noble aspirations and is directed to really disinterested ends. It is intended that the statistics of public education and other subjects bearing on social science shall receive special attention.

Don José Amador de los Rios, the Professor of the Critical History of Spanish Literature, and a frequent contributor to the *Revista de España*, furnishes an essay on the influence of the Spanish clergy in the State during the Middle Ages. Another valuable historical article by Don Manuel Colmeiro, treats of the principle of authority in the Spanish monarchy, and traces the sources whence Alonso IX. derived his *Siete Partidas*, and the relative extent to which the Canon and the Roman law contributed their spirit to the famous Spanish Code. The Professor of History, Don Fernando de Castro, contributes a paper on feudalism as it affected the person and property, especially in Spain, where the gradual re-conquest from the Arabs gave it some special features. The servitude, rather than slavery, to which the Arab prisoners of war were subjected, will remind the student of Spanish colonial history of the position of the *Yana-cunas* in Peru; and doubtless the analogy is due to the traditional policy arising out of centuries of frontier warfare.

Don Alfredo Camus, the Professor of Greek and Latin, in a series of learned articles on the comedies of Aristophanes; and Don Francisco Simonet, the Professor of Arabic in the University of Granada, in his essay on Muzarabic literature, bear witness to a revival of sound learning in Spain. Arabic should be the special object of study for Spanish scholars, for while a knowledge of it is essential to a thorough comprehension of their country's history, the rich collection enumerated by Casiri offers an inexhaustible and fertile field of research. It is a most encouraging sign that others should be following the footsteps of Conde and of Gayangos, and that Arabic should find an increasing number of students in a land where its literature once flourished so luxuriantly. Señor Simonet devotes this and a forthcoming article to a consideration of the literature of the Muzarabes, or Christians subject to Arab domination, a little understood but very interesting subject. It appears that the Christian subjects of the Omeiyad Khalifas disdained the study of Latin, and, at least those who dwelt in Cordova, devoted themselves to the literature of their conquerors. The most distinguished of these Christian students of Arabic was an author known as Juan el Hispalense, who occupied the metropolitan see of Seville; but there were many others who wrote both in prose and verse. Thus, through the Arabic language, works were preserved which will throw fresh light on the early history of the Christian Church. By far the most important, in the judgment of Señor Simonet, is the collection of Sacred Canons described by Casiri. It was written in 1087 for the use of the Muzarabic churches of Spain, and dedicated to a bishop with the thoroughly Arabian name of 'Abd-el-Malik. In a future article the learned professor will describe the other monuments of Muzarabic Christian literature which have come to his knowledge. This is an unexplored field of research which will have a special interest for English Churchmen, for several of the prayers and

collects in the Muzarabic ritual are said to have been adopted in our Prayer Book.

Physical science receives its due share of attention in the *University Review*; and, in accordance with the programme, several articles are devoted to social questions. Don Joaquim Maldonado Macanaz, the Professor of the History and Civilisation of British and Netherlandish India, discusses the employment of convicts in colonies, reviewing the policy of England as regards North America before the independence, and New South Wales in more modern times; and frequently quoting the work of Mr. Herman Merivale, on *Colonies and Colonisation*. A suggestive article on necessary reforms in the penal system of Spanish prisons is contributed by Dr. Röder, a Heidelberg professor; and there are two full and comprehensive reviews of works on the history of public instruction in Spain and Portugal.

The rector and professors of the Madrid University have laid down an excellent programme, and are carrying it out with vigour and ability. We have come to the end of the majority of their articles with regret, and look forward with special interest to the continuation of several which now only give a foretaste of what is to come.

The *Revista de España* continues to flourish through all the anxieties and confusion of the civil war, though the notices on internal politics are gloomy and despondent. The very fact of this literary vitality, however, as well as of the commercial and agricultural vitality which co-exist with it, justifies the hope that the troubles of Spain are transient and local, and that better times are not far distant. The elaborate report on the Wines of Spain at the Vienna Exhibition, addressed to Don Manuel de la Concha, Marqués del Duero, by Don J. Emilio de Santos, in January, 1874, shows the activity that still exists among the Spanish vine growers. The dedication reminds us that the brave chief who has fallen at Estella was not a mere soldier, but that he was also well known as an ardent agriculturalist. Of the agricultural products of Spain, forty-six per cent. consist of the wine industries, which were represented at Vienna by 145 exhibitors, who obtained forty-seven prizes. As regards the number of prizes, Spain took the eighth place—above Portugal, Belgium, the United States, Sweden, Switzerland, Holland, Denmark, and fifteen other countries that exhibited. The article, one of a series, by Don Miguel Rodríguez-Ferrer, in the *Revista* of March 13, on the agriculture of Cuba, is another sign of the interest taken by educated Spaniards in the material progress of their country and its dependencies.

These numbers of the *Revista* also contain evidence of much intellectual activity in various branches of literature. The articles of most solid value are those by Don Francisco de Cardenas, on the ancient proprietary rights in the land, in Catalonia, Majorca, and Valencia, and on the consequences of the disruption of feudal tenures. He describes with careful minuteness the "settlement," as it would be called in India, which was made by King Jayme I. of Aragon after the conquest of Valencia, including the various tenures by which land was allowed to be held, and the obligations and privileges of the feudal tenants. Similar details are given with reference to Majorca, and, in the article continued in the number for April 28, Señor Cardenas traces the gradual changes which, in later times, had the effect of nullifying and altering the feudal tenures. He explains the action of the Cortes, in the fourteenth and fifteenth centuries, with reference to the curtailment of the number of castles and strongholds in Spain, and the measures taken by successive kings, at the instigation of the people assembled in Cortes, to prevent the erection of fortresses and the assumption of jurisdictions by the nobles, without royal licence. On the other hand, the writer clearly sets forth the evil effects of the excessive generosity of some of the kings, especially of Enrique II.,

in granting crown lands to their supporters, and thus alienating an important source of revenue; a practice which was strongly opposed, and at last checked by the assemblies of the people. This series of articles contains information of great historical value, carefully collected and arranged, which throws additional light on the nature of the tenures in the Aragonese kingdom during feudal times. Much of it was not accessible to Mr. Hallam when he wrote on this subject in his *Middle Ages*. Mr. Hallam's principal authority was Marina's historical essay, which he borrowed from the library at Holland House. He was not acquainted with the treatise on the tenures of Valencia by Branchat, Escalona's History of Valencia, the *Instituciones dels Fers y Privilegio de Valencia* of Tarazona, and other authorities cited by Señor Cardenas.

In the number of the *Revista* for February 28, Don Eduardo de Cortázar contributes a very interesting article on the popular customs of the ancient province of Asturias, the fatherland of Don Pelayo, and the rallying point of the Goths, whence, by slow degrees, they reconquered Spain from the Moors. He begins with the old port of Llanes, on the shores of the Bay of Biscay, founded by Alonzo IX. of Leon, and once the seat of a flourishing fishing trade. Indeed, the seamen of Llanes formerly engaged in the whale fishery, and Madoz tells us that the "Casa de las Ballenas," where the blubber was boiled down, is still standing. But the place has now lost its trade, though the people retain their old customs and superstitions. Many are their religious holidays, but their chief festivals are on the days of their patrons, San Roque and Santa Maria Magdalena. On the eve of San Roque the faithful Llanescos set up a sort of maypole, hung with prizes for the lads and lasses, who dance and sing until the early hours of the morning. On the day of San Roque, after mass, the young people of Llanes, dressed in their smartest clothes, make offerings of "branches of bread," which are long branch-like loaves, formed in a twisted pyramid, and adorned with flowers and silken streamers, to be afterwards distributed among the poor. The grand procession follows, and then, while the older people feast under the shade of trees, young men and maidens begin with ardour to perform the dances of the country, the *giralduilla*, *fricote*, *fandango*, and *gallegada*, the two latter well known in Madrid, but the first a somewhat romping country dance of the Asturias. The light-coloured costumes under the shady trees, and the scattered groups moving rapidly, and appearing and disappearing through the clumps which are scattered over the meadows, form a picturesque and very pleasing sight. Another custom of the good people of Llanes is to form parties on the river Carrocedo, which, on festal days, is covered with skiffs and launches, dressed with flags, whence the sound of drums and fifes floats over the waters, with occasional songs from the gaily-dressed girls who fill the stern sheets of all the boats in the flotilla. Señor Cortázar describes all this and much more, giving the words of the Asturian songs, the figures of the country dances, and the popular tales of *zanas*, or sea nymphs, gnomes, and fairies. Many tourists from this country think it necessary to publish their "impressions" of Spain, but none ever go below the surface, or tell us as much of the people, their habits and beliefs, in a whole volume, as Señor Cortázar gives us in ten pages. We sincerely hope that this pleasant and instructive article will be followed by others on the same subject.

Señor Amador de los Rios has contributed a series of articles to the *Revista* on the architectural monuments of Portugal, and in the number for February 28 he describes the edifices of Coimbra in detail. He combats the opinion, enunciated by Portuguese writers, that the architectural decadence of Portugal was due to Spanish domination after the death of Don Sebastian, contending that the decay of art may clearly be traced to a period anterior to that event. Another writer on

architecture is Don Patrocinio de Biedma, who furnishes a paper on the Cathedral at Seville. Like other contributors, a tone of sadness pervades the writings of Señor Biedma, a feeling which the troubles of their country must give rise to in the breast of every Spaniard. "Never," he says, "has Spain needed, more than now, the softer reflections of the light of sentiment to aid in dissipating the dark shadows which obscure her sky."

The Eastern studies of Don Francisco Garcia Ayuso, which we have already noticed more than once, have borne additional fruit in two of the numbers of the *Revista* now before us. On this occasion his subject is the Zend-avesta, and he presents his readers with a critical review of the labours of Dr. Martin Haug, which is more complete and exhaustive than anything that has yet appeared in England on the same subject. Señor Ayuso's essay on traditions of a deluge is also learned and interesting.

CORRESPONDENCE.

SIGNATURE OF LORD TALBOT.

July 6, 1874.

The following document is interesting, as bearing the autograph signature—unique, I believe—of that celebrated warrior the first Earl of Shrewsbury, Shakspeare's Lord Talbot. It is an acknowledgment or receipt written on a small piece of parchment in the form of an indenture. The part bearing the Earl's signature, which would remain in the possession of Stephen Popham, and from which my copy is taken, is preserved in the Public Record Office. We learn from it that the counterpart was signed by Stephen Popham, and remained with the Earl. It has most likely perished:—

"Ceste endenture faicte entre hault et puissant Seigneur Monseigneur le Conte de Schrosbury et de Wesford Seigneur de Talbot et de Furnywall Mareschal de France dune part Et Messe Stephne Popham dautre part Tesmoingne que mondit Sr le Conte de Schrosbury a receu du dit Popham compt par les mains de Jehan Londres serviteur de mondit Sr le Conte les ordonnances et artilleries qui ensuivent cestassavoir deux petits barils de pouldre a canon vj^{es}. et xij lances ferrees cent et xvj ars amain et vj cens et xx trousse de fleiches lesquelles ordonnances et artilleries le Roy nostre dit Sr a ordonne estre baillies et delivrees a mondit Sr le Conte pour le fait de certaine charge que lui a baillie le Roy nostre Sr de certains navires de guerre ordonnez conduire de ce

Roy^{me} a la bastille faicte devant la ville de Dieppe occupee par les ennemis et adverses du Roy nostre Sr certaines vires pour ladvitaillment des soldoiers estans en icelle bastille et pour la garde de la mer par aucun temps En tesmoing desquelles choses a la partie de ceste escrite endentive demourant devers mondit Sr le Conte le dit messre Stephne Popham a miz ses saing manuel et signes le xxvij jour daoust lan mil ccccxlj Et le xxj^{me} an du Regne du Roy nostre Sr Henry vj^{me}.
TALBOT."

The date, it will be seen, is about fourteen years after the raising of the siege of Orleans by Jeanne d'Arc, and about ten years before the Earl was killed at Chatillon. The English power in France had already declined to a very low ebb, Dieppe, on the very coast of Normandy, being in French hands. Stephen Popham was one of the commanders of the English fleet in the Channel at this time. We learn from the Proceedings of the King's Council for June 26, 1442, that William Eure, Stephen Popham, Knights, Myles Stapilton and John Heron, Esquires, were assigned to keep the sea, with licence to grant letters of safe conduct to such prisoners as they should capture. Stephen was no doubt a relative of John Popham, who had held the important post of Treasurer of the King's Household in this reign. The victualling of the Bastille of Dieppe was at this time an object of particular attention. There is frequent reference to it in the records of the day.
E. HAWKESLEY RHODES.

FRESH DISCOVERY CONCERNING JOHN VAN EYCK. Bruges: July 6, 1874.

During my recent visit to Lille, I made some researches with the view of clearing up the question as to whether John van Eyck spent any time in that city between 1425 and 1432. It is known that Philip of Burgundy took the great master into his employment on May 19, 1425. I have now ascertained that he resided at Bruges from that date until August, when he removed with all his goods and chattels to Lille, where he took up his abode in the house of Michael Ravary, clerk of the works of the castle of Lille, with whom he continued to reside at least until Midsummer, 1428. The duke's chapel was restored at this period, and it is possible that Van Eyck may have been employed in executing paintings to adorn it.
W. H. JAMES WEALE.

THE ROOTS *DHA* AND *DU*.

Parks End, Oxford: July 6, 1874.

It is quite refreshing in these days of infallibility to hear a scholar frankly own that he has made a mistake. It is true that Mr. W. W. Skeat can well afford to do so; but the rich are not always the most generous, and a scholar who knows to what exceptions Grimm's law is liable would not be at a loss how to plead even for a Gothic *t* as corresponding to *dh* in Sanskrit, and *th* in Greek. Does not even Curtius admit the identity of Sk. *khid*, *खिद* in Greek, *scindo* in Latin, and *skaidan* in Gothic, simply because, as he says, "the anomaly must be admitted on account of the perfect identity of meaning"? If that were sufficient excuse for a breach of Grimm's law—which it is not—it would surely be difficult to resist those who hold *θεός* and *deus* to be identical.

However, I wished chiefly to express my perfect agreement with Mr. Skeat and Dr. Morris as to the origin of the *d* in *I loved*, and at the same time to disclaim any kind of ownership in the discovery of its origin. In my "Lectures" I ascribed that discovery to Grimm and Bopp, but I believe it was known even before their time. All I endeavoured to do was to show the *rationalité* of such compounds as *I love-did*, and in spite of objections raised against it both by German and English scholars, I still hold as firmly as ever to my former explanation. How reduplication is one of the most primitive processes for imparting motion to a root, for expressing continuity of an act, for forming what in German is

called a *Zeit-wort*, I tried to explain both in my *Lectures* (vol. i., p. 271) and in my *Essay on the Turanian Languages*, p. 44-46. Instead of repeating the whole root, for the purpose of imparting to it an active character, some languages repeat the first, others the last consonant. While Sanskrit forms *ta-tan* from *tan*, Tibetan changes *nag*, black, into the verb *nag-go*, to be black; *sum*, three, into *sum-mo*, it is three. In Sk. *da-dha-u* we have the full reduplication of the root *dha*, to do, and this was afterwards used to form compound tenses, just as we have in Sanskrit from *ās*, to sit, the perfect *āsām kakre*, he sit-did.

With regard to the Gothic *taujan*, I think I have discovered its origin in Sanskrit *du*, a root which is not recognised by Sanskrit grammarians, but has to be admitted by comparative philologists. There is the verb *duasyati* in the Veda, meaning to worship, a denominative verb, derived from *dūvas*. *Dūvas* meant, originally, any *opus operatum*, and presupposes a root *du* or *dū*, in the sense of acting or sedulously working. It exists in Zend as *du*, to do. With it we may connect the Gothic *taujan*, *gataujan*, the O.H.G. *zaucjan*, the Mod. German *zaueu* (Grimm, *Grammar*, i., p. 1041). The Gothic *tavi*, *opus*, O.H.G. *zauwi*, M.H.G. *gezouwe*, come from the same source. The Sanskrit *karma*, work, is a very old name for sacrifice, and we also find in the Veda a nom. plural *d-dūvas*, those who do not offer sacrifices. Again, as *carmen* came to mean a charm, it seems possible that the Old Norse *taufur*, incantamenta, O.H.G. *zoupar*, M.H.G. *zouber*, Mod. German *zauber*, may likewise find their explanation in the Sanskrit *dūvas*. Some further remarks on this root and its derivatives in the Veda may be seen in my *Translation of the Rig Veda*, vol. i., pp. 63, 101.
MAX MÜLLER.

PROCTOR'S "UNIVERSE AND COMING TRANSIT."

12, Royal Parade, Blackheath: July 6, 1874.

There are some points in Mr. Proctor's letter in the ACADEMY for July 4 which call for some remark. In my notice of Mr. Proctor's work I dealt as gently as I could with his statements relating to the Transit of Venus, because they appeared to be due partly to inadvertence, and partly to want of full information; but as he now claims credit for the *very* arrangements of which a few months ago he predicted the probable failure, it becomes necessary to speak more plainly. Let us examine the three points which Mr. Proctor opposed in Sir G. B. Airy's original programme for 1874.

The suggested search for Antarctic stations for 1882 has nothing whatever to do with 1874. This suggestion was never brought officially before the Admiralty—a sufficient proof that it was given up at a very early date. Mr. Proctor may have good reason to conclude that he was the cause of this change, but I prefer to accept Sir G. Airy's version of the matter.

The statement that Halley's method fails totally in 1874, which is Mr. Proctor's second point, can hardly be considered as part of a programme; but, waiving this, Professor George Forbes has already pointed out in *Nature* that Mr. Proctor does not really understand what Halley's method is, and that he confuses it with the Method of Durations, which Sir G. Airy has carefully distinguished from it. The former depends entirely on making use of the rotation of the earth, and this cannot be done successfully in 1874. But even independently of this, and using the term in its widest sense, Mr. Proctor has no authority whatever for the assertion that Halley's method is to be used at four of the selected stations. Both ingress and egress will of course be observed wherever practicable, but the longitude will be determined with the greatest possible accuracy, and the two observations at each of these stations will be worked up independently by Delisle's method.

We now come to the third point, the addition of a station in India, and for this Mr. Proctor

deserves, and has received from the Astronomer-Royal, full credit; but it must be remembered that photography was an after-thought, and that it is really as a photographic station that Roorkee (not Peshawur) is to be occupied: and that the other instruments will be applied for Delisle's method, not the Method of Durations, as Mr. Proctor supposes.

With regard to the arrangements finally made by foreign countries, Mr. Proctor has probably experienced some difficulty in getting proper information, which accounts for the discrepancies between his statements and the facts.

The Germans and Americans are paying the greatest attention to determination of longitudes (for Delisle's method), both by telegraph and chronometers, and M. Auwers has arranged a most elaborate scheme for this purpose. The Russians are doing the same, and have further sent an additional party to Thebes, one of the Astronomer Royal's Delislean stations. The French will occupy the Marquesas, while Suez is a British station. Why Mr. Proctor should mention Tahiti as a Delislean station for the Americans, or anyone else, I cannot conceive. The Americans selected the Crozet group at the suggestion of the Astronomer Royal, for Delisle's method.

It will be seen from these facts, which are documentary, that there is no nation which relies on observations of the transit pure and simple, i.e., the Method of Durations; the longitude is in all cases to be determined with the greatest care. It is idle for Mr. Proctor to call every station which sees both ingress and egress a Halleyan station: the true test of a Halleyan station is that its longitude is not required, a test which, I think, Mr. Proctor would find it exceedingly awkward to apply to the stations of any foreign country.

W. H. M. CHRISTIE.

THE AUXILIARY "DO."

3 St. George's Square, N.W.: July 4, 1871.

I cannot accept my friend Mr. Skeat's reasoning as to the well-known early pro-verbal use of *do* being due to ellipsis of the auxiliary. *Do* stands for other verbs as a pronoun does for nouns; it is used simply to prevent the repetition of the verb. In Mr. Skeat's *Havelok* and *Ormulum* instances, the *doth*, *dos*, stand for *dunteth*, *folweeth*, *shæweth*. We cannot let him first assume the auxiliary use of *do* at a time when it is not known; then, secondly, assume that the pro-verbal use, which is well known in Anglo-Saxon (see Grein), arises from it; and then, thirdly, prove the auxiliary use from the pro-verbal one. But Mr. Skeat's instances are valuable as showing how gradual the transition from the causative to the auxiliary use of *do* was; and also as confirming the fact that it was the Midland dialect that gave us this use, as it did so many others in our grammar and speech.

F. J. FURNIVALL.

NEW FACTS ABOUT SPENSER.

Norton Canon: July 8, 1874.

Mr. R. B. Knowles's discoveries with reference to the school at which the poet Spenser was educated are peculiarly interesting to me, as an old Merchant Taylor. Perhaps you will allow me to draw attention to the fact that almost contemporary with the poet was John Spenser, D.D., afterwards President of Corpus Christi College, Oxford, the intimate friend (and colleague) of Hooker. Dr. Spenser left Merchant Taylors in 1577. Could he have been related to the poet, who left it in 1569?

C. J. ROBINSON.

THE statue of Dr. Priestley will be unveiled at Birmingham on August 1 (the centenary of his discovery of oxygen). Professor Huxley will present the statue to the town on behalf of the subscribers, and will afterwards deliver an address in the Town Hall.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, July 11,	1 p.m.	Sale at Sotheby's of the Numismatic Library of General C. R. Fox.
	3 p.m.	Crystal Palace Summer Concert (Scandinavian Music). " Last Opera Concert (Royal Albert Hall).
MONDAY, July 13,	8 p.m.	Last Philharmonic Concert: M. Saint-Saens (St. James's Hall).
TUESDAY, July 14,	1 p.m.	Sale at Christie's of the Collection of Musical Instruments of the late G. W. Hancock, Esq.
WEDNESDAY, July 15,	1 p.m.	Royal Horticultural.
	"	Sale at Puttick and Simpson's of rare and valuable Books.
THURSDAY, July 16,	1 p.m.	Sale, by Messrs. Capes, Dunn & Co., of Manchester, of Engravings, Etchings, &c., of the Old Masters.
	9 p.m.	Madame Patti's Mozart Concert (Covent Garden Theatre).
FRIDAY, July 17,	8 p.m.	Masks and Faces at the Royalty.

SCIENCE.

The Study of Sociology. By Herbert Spencer. International Scientific Series. (London: Henry S. King & Co., 1873.)

THIS volume is a republication, with some trifling additions and alterations, of a series of papers which appeared in the *Contemporary Review*. It commences with an exposition of the need for sociological study; one chapter is devoted to proving the possibility of a social science, another to giving a general outline of its nature, and the rest of the book consists of a discussion of the difficulties that lie in the way of successful study, and the discipline and preparation necessary to overcome them. To most people the chief interest in the book will lie in the discussion of current social questions, practices, and opinions that is involved in the very profuse illustration with which Mr. Spencer explains and supports his leading positions. Every chapter contains numerous instances drawn from all quarters of the careless and incorrect reasoning which Mr. Spencer thinks, and perhaps justly, we are in the habit of applying to social and political matters, and as many of these relate to matters of frequent controversy and general importance, there is no lack of interest, even to those who are not inclined to concern themselves with the projected social science. Perhaps so far as Mr. Spencer merely desires to show the weaknesses of our present mode of reasoning, a great part of his demonstration of human folly might safely have been omitted; as those who are likely to occupy themselves with the scientific study of society are pretty well aware of it, and, indeed, nearly every one is ready to assent to it in general terms, although there may be some dispute about the individual cases in which it is exhibited. About the remedy there may be less unanimity, although even with regard to that the divergence of opinion may not be so great or irremediable as it is sometimes represented to be. Mr. Spencer thinks that he and others who consider the scientific study of society as a matter of the first necessity, are at issue hopelessly with those who are inclined to ascribe the changing fortunes of societies to

the influence of great men or the interferences of Providence; as these must almost of necessity exclude the idea of natural causation from their conception of social history. Others deny the possibility of constructing a social science from consideration of the difficulty of disentangling the obscure and complicated relations of social facts. But every one, Mr. Spencer points out, admits in practice the possibility of a certain amount of prevision in the actions of men and nations, and even from those writers who in general terms deny the possibility of applying scientific reasoning to human affairs it is easy to select examples of its application in special cases. The possibility of doing so naturally suggests that there may be a misunderstanding among the disputants as to the precise meaning and extent of the claims in question, and that the best way of clearing it up would be to construct the science instead of entering into preliminary discussions with those who deny its practicability. It is quite possible that those who are at present inclined to protest against what they consider the extravagant claims of the prospectus will find nothing seriously objectionable in the finished undertaking.

When we turn to Mr. Spencer's third chapter on the "Nature of the Social Science," we find that the claims and views he puts forth are really very moderate. Commencing with the proposition that in every aggregate of men, as in every aggregate of matters, the properties of the aggregate must be determined by the properties of the units composing it, he concludes that there must be a social science expressing the relation between the two with as much definiteness as the natures of the phenomena admit. Commencing with the lowest types of men, this science has to show how slight modifications of individual nature make larger and more coherent societies gradually possible; it has to trace the genesis of the social relations into which the members fall, and to exhibit the stronger social influences which, by farther modifying the character of the units, facilitate farther aggregation and greater consequent complexity of social structure.

"In every case it has for its subject-matter the growth, development, structure and functions of the social aggregate as brought about by the mutual actions of individuals whose natures are partly like those of all men, partly like those of kindred races, partly distinctive."

Of course all these social phenomena have to be explained with due reference to the conditions of locality and relation to neighbouring societies to which each society is exposed. The objects and limits of the science thus defined are made clearer by an illustration which Mr. Spencer gives in answering the objection, that in societies, causes and effects are related in ways so involved that prevision is often impossible. After pointing out that in the case of a concrete phenomenon the most exact sciences enable us to make predictions that are mainly general or only partially special, he adverts to the analogy between the life of an individual and the life of a society, in order to show how in either case the power of scientific prevision can only be claimed in relation to a certain class of facts.

In the life of man those events which we ordinarily class as biographical do not admit of prevision. What success a child may attain to in life, or whether its career will be cut short by accident or disease, are unanswerable questions; and the analogous events in a nation's history, its wars and fortunes, its successes or adversities, are equally beyond the power of foresight. But turning, says Mr. Spencer, from special facts to those of a less special quasi-biographical character, we find that a certain degree of prevision is possible. We know something of the order in which a child's intellectual faculties are unfolded; something also of the changes in his emotional nature. "Whether he will marry or not, no one can say; but it is possible to say, if not with certainty, still with much probability, that after a certain age an inclination to marry will arise." And passing over entirely the facts that are either biographical or quasi-biographical, we find remaining classes of facts of which the prevision becomes comparatively certain and definite—the facts of growth, development, structure, and function. No one denies that these form the subject-matter of science. So also in the nation Mr. Spencer contends that there are structures and functions which make possible the doings which form the subject of history, and it is these structures and functions, in their origin, development, and decline, with which the social science is concerned. We must note, however, some important modifications of this analogy. The structures and functions of the social organism are "less specific, far more modifiable, far more dependent on conditions that are never twice alike," than the structures and functions of the human body. The different social organisms must be arranged in classes and sub-classes, and instead of comparing the social science to the morphology and physiology of man, it would be a more correct parallel to compare it with morphology and physiology in general. Indeed, each nation, as Mr. Spencer elsewhere observes, may be said to form a species by itself, and, we may add, in the case of an existing society a species as yet unascertained, as we neither know the length of life that is before it, nor the extent to which it may consequently present new features of development. It is clear, at all events, that such a science makes no such claims to prevision as those which have aroused the opposition of the writers quoted by Mr. Spencer. Even should it be developed to its utmost possible extent, the biographical and quasi-biographical details will form an ample field where great men and Providence may still be supposed to reign without interfering offensively with the investigations of sociologists.

The difficulties that lie in the way of sociology are, as Mr. Spencer forcibly impresses on us, both numerous and formidable. The student of social science is met in the very first stage of his investigation by all the troubles that beset the historian, but in a more aggravated form, inasmuch as the facts he requires are less simple and prominent, and more liable to misinterpretation, than those with which history has hitherto chiefly concerned itself. He has not merely to ascertain the character and

history of social institutions, but he has to show how these were necessarily connected with the characters of the individual units of the society, and how each change in the institution arose from some subtle modification of the circumstances or natures of the members of the society. Anyone who considers the difficulty of ascertaining and expressing the character of those units whom we have every opportunity of observing for ourselves, will probably not be inclined to underrate the labour and uncertainty which must attend the attempt to draw trustworthy conclusions as to the nature of men far removed from us in time, character, and circumstances. All our information must be derived through others, sometimes coming to us through several hands, and sometimes from conflicting sources; and we have only to look at what passes under our eyes to see how much the reports of comparatively simple facts are vitiated through defective observation, or distorted by self-interest or prejudice. Then, even supposing that we may overcome the objective difficulties of incorrect or insufficient information, the complexity of details, and their wide distribution in space and time, we have subjective difficulties of a not less formidable character. Our imagination is deficient in plasticity. We are apt to conceive men whose mental and moral characters differ widely from ours, as sharing our opinions and acting from our motives; and even if conscious that we would err grievously through such a supposition, we may still find it impossible to conceive, in an adequate manner, a mental state that is only remotely akin to any one with which we are familiar. Further, we have subjective impediments that are not merely negative, but positive. We are led astray by emotions which generate or sustain prejudices in favour of ourselves, our country, our form of government, the social relations, opinions, and practices among which we have grown up. Of all these we have to rid ourselves in order to form unbiassed social judgments, and Mr. Spencer confesses that even the best are likely to do so imperfectly.

Mr. Spencer illustrates these various sources of difficulty by pointing out how they impair and distort our judgments upon the practices and opinions of modern life. Perhaps in some cases he is apt to make his illustrations either too profuse or too lengthy. We are led away from the main line of thought into supplementary discussions, which do not always help the reader, even when he is inclined entirely to agree with Mr. Spencer's view of the subject in dispute. For instance, nearly the whole chapter on the "Bias of Patriotism" is taken up with a refutation of Mr. Matthew Arnold's aberrations in the contrary direction; and as an illustration of the objective difficulties, we have a discussion of the Contagious Diseases Acts (a subject which seems to attract sociologists as valerian does cats) too long and too doubtful for its purpose, and too short for a thorough discussion of the question. Mr. Spencer is very indignant, it may be said, at those who "in pursuance of what they call practical legislation, prefer an induction based on a blue book to an induction based on universal

history." Which of these two formidable sources furnishes the correct induction, or what really is the induction to be drawn, is not a matter for discussion here; but perhaps Mr. Spencer might have with profit taken an illustration from a less fiercely contested question. But although it may be doubted whether for one class of readers Mr. Spencer has not heaped together a number of examples out of proportion to the propositions to be proved and illustrated, it is quite possible that he will in consequence succeed much better in securing the attention of those whom he especially desired to interest in the subject; and the book in its present form affords much more interesting and amusing, although sometimes irritating reading, than if its illustrations had been strictly limited to those necessary to make clear its scientific import.

The chapter on the Educational Bias is especially interesting, as it brings Mr. Spencer's mode of treating some subjects of considerable importance into direct comparison with one which is very current. Mr. Spencer has been struck, as an acute observer could scarcely fail to be, with the contrast between the religion most men profess on Sunday, and their opinions and practices during the rest of the week. He explains it by telling us that it would clear up our ideas about many things, if we recognised distinctly that we have two religions—one of which he calls the religion of enmity or egoism, and the other the religion of amity, altruism, or self-sacrifice. The first was the primitive form, the other arose to correct by an opposite excess the religion of unqualified egoism. "The nobility of self-sacrifice set forth in Scripture lessons, and dwelt on in sermons, is made conspicuous every seventh day, while during the other six days the nobility of sacrificing others is exhibited in glowing words. The sacred duty of blood-revenge, which as existing savages show us constitutes the religion of enmity in its primitive form, which as shown us in ancient literature is enforced by Divine sanction, or rather by Divine command, as well as by the opinion of men, is the duty which during the six days is deeply stamped on natures quite ready to receive it, and then something is done towards obliterating the stamp, when on the seventh day vengeance is interdicted." It is rather hard upon ancient literature to describe as the cardinal point of its teaching the sacred duty of blood-revenge; but, as Mr. Spencer tells us that he has effectually resisted classical culture, and "knows nothing of the masterpieces of ancient literature in the original, and very little in translation," it is perhaps natural that their results should be summed up briefly and decidedly. One is more inclined to be surprised that so subtle an analyst as Mr. Spencer is content to lump together, as he apparently does, honour, self-interest, and admiration of brute courage as branches of a worship which may be described indifferently as the religion of enmity or egoism. But the treatment of the competing religion is more noteworthy. Mr. Spencer shows that pure altruism, or the doctrine of self-sacrifice in its extreme form, is equally untenable with extreme egoism. He demonstrates—as, indeed, he

finds little difficulty in doing—that were every one to neglect his own work and busy himself solely with the affairs of his neighbour, the whole existing industrial organisation would fall in pieces; and were every one to refuse a gratification in order that his neighbour might enjoy it, no one would enjoy it at all. It is clear either that Mr. Spencer has got hold of a singular form of the doctrine of self-sacrifice, or that he believes that extremely unselfish people must at the same time be extremely foolish. But he continues further:—

“The absurdity of unqualified altruism becomes, indeed, glaring on remembering that it can be extensively practised only if in the same society there co-exist one moiety altruistic and one moiety egoistic. Only those who are intensely selfish will allow their fellows to behave to them with extreme unselfishness.”

This doctrine that unselfish people can only exhibit their unselfishness to their opposites is in refreshing but startling contrast to the ordinary view. Most people think that one difficulty in practising what Mr. Spencer calls “the extreme Christian theory, which no one acts upon, which no one really believes,” arises from the fact, both in the cases of nations and individuals, that others either won't act upon Christian principles, or take another view of their meaning. Mr. Spencer considers that the most fatal obstacle to the practice of “extreme Christian principles” would be the adoption of Christianity by the whole earth. We should then be unable to love our enemies, because we should be in the unfortunate position of having no enemies to love.

It is too soon to form any opinion of the possible practical value of the social science as sketched in outline by Mr. Spencer. It is to be hoped that we may soon have the opportunity of seeing his design carried out more thoroughly in the forthcoming *Principles of Sociology*. But in the meantime it will be observed that the assistance in the way of prevision which could be got directly from the conclusions of the science must be necessarily small. If we recur to Mr. Spencer's analogy between the science of society and the science of man, it will occur to every one, that even were we to permit the prevision of what Mr. Spencer calls quasi-biographical facts, the result would not be very startling. Probably the great proportion of those that could be established would be found to be truisms, whose only difficulty lay in their application. But keeping in mind the correction that, looking to the wide differences between individual societies, we must regard the social science as more nearly akin to general morphology and physiology than the special sciences of man, the value of the possible conclusions becomes greatly impaired by their greatly increased generality. Whatever may be the value of previsions applicable to the growth and development of the structure and faculties of a child, it is evident that these must very much decrease in importance when they must be made so general as to be also applicable to a calf or a kitten. Of course it is quite true that even a science that only yielded truths of an extremely general character might be of very considerable assistance in the way of guiding investiga-

tion into the special cases. But for practical purposes we are inclined to suspect that an accurate knowledge of the latter will be always vastly more difficult and important than anything that is to be attained by “induction from universal history.” Perhaps it is to be regretted that claims have been advanced at all at this stage in behalf of the social science on the ground of prevision and practical value. It is a subject of sufficient interest and importance, even although its efforts were entirely confined to the elucidation of history; and until its students have succeeded to a far greater extent than they have already done in establishing its value as an exponent and interpreter of the past, it is vain to hope that they will be seriously listened to when they speak of the future.

In one respect, however, Mr. Spencer's present volume, and we hope still more his larger work, will assist in dissipating prejudices against sociology. The public have been too much accustomed to associate the name of social science with isolated crotchets. They have been addressed in the name of science by writers who are soon detected as pamphleteers in a scientific skin, pressing for reconstruction and immediate legislation upon arguments which no one can perceive to be more scientific in their character than the average leading article. Mr. Spencer, on the other hand, has always in view the impossibility of moving farther or faster than the slow changes in the individual members of the society will permit. This, indeed, may, in one sense, be said to be the main practical outcome of his speculations. The laws of our development are fixed by our present condition. We may retard or obstruct our growth, we may introduce morbid elements into our structure by attempts to force its growth into impossible forms, but we cannot compel the body politic to assume another form than that which is naturally the result of the character of its constituent units. Hence the importance of ascertaining distinctly, if that be possible, what are the stages of development through which a nation has naturally to pass. If Mr. Spencer, or his disciples and successors, can succeed in accomplishing the task with anything like certainty, and are able to present such a sketch of the future as shall neither be useless from uncertainty nor vagueness, it will be difficult to overestimate the service they may render. Whether the task be really possible is a question that can only be solved by performance.

ALEXANDER GIBSON.

Fragments of a Samaritan Targum, edited from a Bodleian MS., with an Introduction, containing a Sketch of Samaritan History, Dogma, and Literature. By John W. Nutt, M.A., Fellow of All Souls' College, &c. (London: Trübner & Co., 1874.)

THIS handsome volume consists of two parts: an edition of a valuable Samaritan text, and an introductory sketch of the Samaritans. Mr. Nutt has wisely and kindly allowed the latter to be sold separately, and it is to this part of the book that the following remarks mainly refer. I venture to say that he has laid theological students under an obligation,

not only for filling up a gap in our learned literature, but also for showing them what a monograph on historical theology ought to be. It is indeed only a “fellow of the craft” who can estimate the “sum of pains” which go to the production of such a work, but even prentice-hands will detect the difference between it and the crude compilations which form nine-tenths of our current manuals. Let us pass at once to the first section of the Introduction, which deals with the history of the Samaritans. Their existence as a nation dates back to the settlement of colonists, which ensued upon the so-called “captivity” of the Ten Tribes. Mr. Nutt shows reason from the Hebrew records to believe that, “in all likelihood, a considerable population of Israelites remained behind” (pp. 5, 6); he might even have ventured on a more positive assertion, considering that in the Annals of Sargon the number of captives is fixed at the low figure of 27,280. It is only an apparent objection that the Samaritan in the narrative of the Ten Lepers is called ἀλλογενής (Luke xvii. 18). For the use of the word in Exod. xxix. 33 (Sept.) proves that it will quite well bear the sense of “profane,” that is, in the case of the Samaritan, one not belonging to the orthodox community. There is a real difficulty, however, in the fact that some of the leading Samaritans in the time of Zerubbabel describe themselves as of foreign, and even non-Semitic origin (Ezra iv. 9; comp. Jos. Ant. xi. 4, 9), and as only having sacrificed to the God of the Jews since the days of Esar-haddon (Ezra iv. 2). It is not enough to say with Mr. Nutt (p. 8, note 1), that, “when it suited them, the Samaritans would deny all connexion with the Jews, and assert their heathen extraction.” For, in this case at least, it was not the interest of the Samaritans to draw attention to their alien origin; their proposal to take part in the building of the Temple was, as Ewald remarks, meant quite seriously (*Geschichte* iv. 134). Is it not more probable that the stricter monotheists among the Israelites had refused to amalgamate with the non-Semitic immigrants; or, at any rate, that there was a popular consciousness, as in Spain and Arabia, of the distinction between families of pure and of mixed extraction? A somewhat similar hypothesis is offered by Kuenen, to whom I owe the idea, in his *Godsdienst van Israel*, ii. 109. There is, I think, some confusion in Mr. Nutt's exposition of this subject, which is not diminished by his remark (p. 7) that “Zerubbabel and his returning brethren may have had good reason for declining the co-operation of the ‘lion-converts.’” Surely the “lion-converts” (a striking phrase, for which Mr. Nutt refers to the Talmud) were Semitic, whereas the parties to the negotiation with Zerubbabel were of non-Semitic origin. (Comp. 2 Kings xvii. 24–28; Ezra iv. 2.)

The Samaritans were a turbulent people, as Jews, Romans, and Christians all learned to their cost. It was a rising against the Christians in 529, severely repressed by Justinian, which led to their final extinction as a nation. Many fled to Persia, many became Christians (p. 22). But there were also flourishing communities of Samaritans outside Palestine, remnants of which seem to have survived to a late period. Between

the thirteenth and the close of the sixteenth century the Samaritans seem almost to have faded from the memory of Christian Europe. Joseph Scaliger was the first to re-open communications with them, but it was the purchase of a copy of the Hebrew-Samaritan Pentateuch in 1616 which again fixed the eyes of scholars on the Samaritan community. Since then a correspondence has been carried on at intervals between various European scholars, e.g., Ludolf and Silvestre de Sacy, and the Samaritan high priests. They have also made several efforts to interest the English and French Governments in their behalf. They have suffered much from the cruelty and avarice of their governors, and are said now to number only 135.

The second part of the Introduction relates to the doctrines of the Samaritans. The only one which can be shown to be of native origin is their doctrine of the Messiah. In general their theology was borrowed from their Jewish neighbours, and was now of a Sadducean, now of a Pharisaic complexion. Moslem influences are also said to have been traced. Their remarkable rites at the Passover have been made familiar to English readers by Dean Stanley in his *Jewish Church*, i. 513. In Part III. Mr. Nutt describes their language and literature. The former, debased as it is, is of interest to the student of the later Semitic dialects. The grammar is Aramaic, but the vocabulary contains a number of foreign words, some of which, according to Mr. Nutt and Dr. Kohn, can be traced to no known source (p. 78). I spare my readers a catalogue of the literature. Its most important elements are the famous Hebrew-Samaritan Pentateuch, which constitutes the Samaritan Bible; the "Samaritan Chronicle," or "Book of Joshua," as it is termed; and the "Targum," fragments of which are here published. Useless as it is for exegesis, this "Targum" is of great value for settling the forms of the Samaritan language, since none of the later documents can be shown to have been written while the language was still living. Mr. Nutt has given a faithful reprint of the Bodleian MS.; he hoped to have added another fragment from a MS. belonging to Trinity College, Cambridge, but, as is still too often the case in England, was unable to obtain the loan of the MS.

It is unusual to find so few *lucunae* in an author's references. I mention the only ones which have occurred to me. Mr. Nutt refers to Frëndenthal's able researches on Polyhistor (Breslau, 1874), but omits M. Havet's *Mémoire* on the date of Berosus and Sanchoniathon (Paris, 1873), who, in Note B, partly anticipates the conclusions of Frëndenthal. Ought he not, too, to have given greater prominence to the opinion of Herzfeld (p. 101), that Hebrew was still spoken by the Jews on their return from Babylon, which is by no means so paradoxical as he appears to think, and is held, among others, by Nöldeke and Schrader? And is he not unfair to the Samaritans (p. 41) in not mentioning that their *rendering*, "Jacob came in peace" (Gen. xxxiii. 18), is adopted by the Jewish commentators (see especially Ibn Ezra's thoughtful comment), so that

here, at least, the Samaritans are free from the charge of having tampered with the Scripture in the interests of their sect.

T. K. CHEYNE.

NOTES AND NEWS.

THE comet discovered by Coggia on April 13 has during the last fortnight rapidly increased in brightness, and is now a conspicuous object in the northern sky. It will continue to get brighter, but unfortunately its motion is directly away from the pole, and as it is now beginning to move south rapidly, it will soon get below the northern horizon, so that probably it will not be visible to the naked eye, in the northern hemisphere at least, after July 15, when it will be nearly as bright as a first magnitude star, though very low down. It is possible, however, that its tail may be seen after the head has set, as was the case with the famous comet of 1843. Mr. Hind, who has devoted much attention to the present comet, considers that it may be seen in full daylight south of the sun with a powerful telescope about July 22, when it makes its nearest approach to the earth. The circumstance that the apparent path of this comet passes nearly through the sun's place, coupled with its very slow motion at first, has made it very difficult to compute its orbit; but theory and observation now agree well, and if observatories in the Southern hemisphere watch it carefully, no less than 200° of its orbit will be fixed, and we can then determine whether it is likely ever to visit us again.

The striking feature of this comet in the telescope is its remarkably bright planetary nucleus, from each side of which a fan of light shoots out transverse to the tail. The spectrum of this nucleus, as found by M. Roget (since confirmed by Mr. Lockyer and at Greenwich), is continuous, indicating a glowing solid or liquid, and therefore supporting the theory that it is a meteor stream. The coma and tail which form the usual parabolic envelope give the characteristic spectrum of carbon consisting of three bright nebulous bands, but what is the form under which the carbon exists remains an interesting question which it is to be hoped that Mr. Huggins will resolve. The tail shows strong radial polarisation.

MR. HENRY WILLETT, of Brighton, has just issued his seventh quarterly report, in which he gives some interesting details respecting the Sub-Wealden Exploration. From this report we learn that the boring has now reached a depth of 1,018 feet. Mr. W. Topley, who has had better opportunity than any other geologist for studying the details of the experiment, believes that the Kimeridge clay was first reached at a depth of about 290 feet, and that it probably continued to nearly 990 feet; thus giving the clay a thickness of something like 700 feet. Although the Kimeridge and Oxford clays are usually separated by the coral rag and calcareous grits, yet several localities are known where the two clays are in immediate contact: this is the case, for example, in Lincolnshire, probably throughout the Fen district, certainly in parts of Norfolk, and to the north and north-west of Aylesbury; a similar uninterrupted sequence is observed in the Netherfield boring. At a depth of 950 feet the cores yielded *Gryphaea virgula*, and at 965 feet fine specimens of *Thracia depressa*; the latter fossil ranges from the Portland beds to the Oxford clay, but is specially characteristic of the Kimeridge beds. At about 990 feet a fine specimen of *Ammonites Jason* occurred; this unique specimen, to which we referred a fortnight ago, is now exhibited in the Museum of Practical Geology, Jermyn Street, and is of great interest as serving to determine the geological position of the strata at that depth, this Ammonite being highly characteristic of the Oxford clay. Mr. Willett concludes his report with a graceful tribute to the memory of Professor

Phillips, who took so keen an interest in the Netherfield experiment. The Exploration Committee pleads urgently for funds to continue the work until the borer shall strike Palaeozoic rocks or shall reach a depth of 2,000 feet; in either case the original object of the exploration will have been fulfilled.

ALTHOUGH it is not mentioned in the last Report, we understand that the Sub-Wealden boring has again been brought to a standstill by another accident, and that to avoid the recurrence of similar mishaps the bore-hole will now be lined with a metal tube to a depth of at least 600 feet. We shall, therefore, hear no more of accidents due to the falling in of the sides of the boring; but the work of lining the hole will be tedious and expensive, and until that is accomplished we can hardly expect to hear any further news from Netherfield.

In the course of a lecture delivered at New York by Professor Agassiz, and reported in the *Revue Scientifique*, frogs, and especially those inhabiting trees, are described as making the forest resound with an infinite variety of cries, many of them counterfeiting the voices of various animals, so as to produce strange illusions. Some bark like dogs, others cry like children, and the traveller is often surprised to find that the plaintive sound he thought proceeded from a deserted infant came only from a group of frogs.

ACCORDING to Professor Agassiz, the turtle of the Amazon swarm to such an extent as to form an important article of food, and he laments the destruction of millions of their eggs by the natives, who make a sort of butter out of the oily matter in the yolk.

Der Naturforscher describes two instruments, invented by Signor Enrico Bernardi, to obtain motions of oscillation and rotation from changes of temperature. He connects two light glass bulbs with a thin glass tube, the ends of which are bent at right angles on entering the bulbs. One bulb has a small tube, through which ether is introduced, and which is closed up when the ether is boiled and its vapour has displaced the air. There should be enough ether left to fill one bulb to the extent of three-quarters. This apparatus is mounted like a scale-beam, so as to be stationary, when the ether is divided equally between the two bulbs. Thin muslin is then put on each bulb, and all the ether transferred to one, which, in descending, is allowed to dip in a vessel of water. The muslin on the other bulb being wetted and freely exposed to the air, is subjected to cooling by evaporation, and the ether is distilled over into it until the balance is turned, the bulb that was in the water rises, and the opposite one drops into the fluid. The bulb that rises comes up with its muslin wet, and in its turn cools by evaporation, condenses the ether, and again changes the balance. Six bulbs and tubes arranged as the radii of a wheel, and so placed that when one half of them dip into a water vessel, the other half are in the air, give rise to a rotation. The bulbs employed are two centimètres in diameter, and the radii of the wheel eight centimètres. The water evaporated in the process has to be replaced to keep it up to the right level. Placing the oscillating apparatus in a window not reached by the sun, he found that sixty oscillations took place in each twenty-four hours, between the middle of February and the middle of March. Signor Bernardi kept a clock in his observatory going for two months by this motive power.

In the first paper in the *American Naturalist* for June, 1874, Mr. Scudder describes the method of preserving caterpillars by inflation, which entomologists will value. Dr. Abbot writes on the "Cyprinoids of New Jersey," popularly known as "Shiners and Minnows." The chief point of general interest which he elucidates is the extent of variation to which the same species (*Stilbe Americana*) is subject as regards size, colour

position of fins, number of radii in scales, and form of mouth. After giving details, for which we must refer to his paper, he exclaims: "It has often been asserted that we never see a species undergoing a radical change; but is not this an instance of such a change—one possibly now of specific value, as a species was once considered?" Other illustrations of variation and modification are given. In a paper on "The Migration of Birds," Mr. Martin Trippe describes a wonderful flight of cranes, which seems to show that they are influenced by some indications of weather-changes unnoticed by man. The scene was Southern Iowa; the time November, 1871; the weather the perfection of Indian summer, clear, bright, and warm. "For three days thousands of the birds flew southward, covering up the sky." Two days later, without warning to the human inhabitants, came sudden snow, hail, and frost. "The cranes had not escaped a day too soon."

Popular Science Review, July, 1874. The first article in the present number of this excellent serial suggests some sea-side occupations a little better than dressing half-a-dozen times a day, and loitering on parades in empty idleness. Mr. Hincks' paper on Plumularians will furnish the means of pleasant occupation to those frequenters of our coasts who will supply themselves with a pocket lens or a microscope, and devote a few hours to some of the most elegant and graceful objects belonging to marine life. The Plumularians are popularly known as "sea palms," and usually confounded with sea-weeds by those unacquainted with their history, and in the habit of picking up objects on the shore. They are closely allied to the Sertularians, or "sea firs," and the history of their curious structure, the habits of their polypes, and the changes they undergo, are easily studied with such aid as Mr. Hincks gives, while the pursuit will not only be found highly interesting for its own sake, but also for the light it throws on those modern doctrines of morphology and development which so greatly influence speculative thought.

Mr. Proctor gives an interesting account of the extensive preparations for viewing and recording the reports of the transit of Venus on December 9, and among the other papers are: one by Dr. Leith Adams on "Living and Extinct Bears;" one by the Rev. J. Crombie on the "Lichen Gonidia Question;" and a valuable reprint of a paper read before the Royal Society by Mr. W. H. Barlow, detailing a series of very remarkable experiments by which the concussions and reactions of the air produced in human speech are made to record themselves in diagrams analogous to those which register the beating of the pulse. Mr. Barlow speaks through a mouthpiece attached to a tube, terminating in a small speaking-trumpet, the aperture of which is covered with gold-beater's skin or thin gutta-percha. Touching this is a delicate spring carrying a marker consisting of a fine sable brush supplied with colour by a glass tube. At one side of the trumpet is a hole to permit the escape of the injected air, "so that the pressure exerted upon the membrane and its spring is that due to the difference arising from the quantity of air forced into the trumpet and that which can be delivered through the orifice in a given time." Such words as "strength" produce a sharp mountainous elevation. "Peter Piper picked a peck of pepper," is recorded in a series of sharp angular elevations for the emphatic syllables, and rapid falls followed by horizontal lines for the softer ones. "The rough R," pronounced by Mr. Barlow, begins with a steep elevation, followed by an irregular pattern, like the teeth of a small saw. When his son pronounced the same letter, the serrated pattern was more uniform. Other patterns are equally curious.

WE are pleased to learn that the talented young zoologist, G. O. Sars, son of the famous Michael Sars, has been named Professor of Zoology at the

University of Christiania, in the room of Dr. Rasch, who retires.

In his lecture on the present condition of mineralogical science, delivered before the Swedish Academy on its commemoration day, March 31, and only now first published, Professor Nordenskjöld asserted that "the most remarkable, and from a theoretic point of view the most interesting, discovery in mineralogy of late years was without doubt the finding of diamonds at the Cape." His whole discourse was a commentary on this text, and he was led among other things to recall the enthusiastic efforts of Aron Forsius, the great mineralogist of Charles IX.'s time, to discover diamonds in Norrland and Lapland, the over-sanguine *savant* having been deluded by descriptions of clear crystals of quartz. At the close of his oration, Professor Nordenskjöld reminded the Academy, with some pride, that more than half of the individual substances that have been discovered during the last two centuries, have been brought to light by Swedish chemists.

Language, its Origin and Development. By T. H. Key. (London: Bell & Co., 1874.) This is a book that ought to have been published long ago. If it had been given to the world before Bopp's *Comparative Grammar* was written, it would probably have been greeted as a learned and ingenious contribution to the study of grammar and etymology. At the present moment, such has been the change produced by Bopp and his school, that the book can only be treated as an anachronism. Wherever we open its pages, we find an utter disregard both of phonetic laws and of the history of language. *To low* is derived from *to bellow*, changed to *blow* and *low*, as if *to low* had not a history of its own, carrying it back to A.S. *hlōwan*, O.N. *hloa*, while *to bellow* has to be traced to the A.S. *bulgian*, O.N. *bylja*. If we add, as a specimen of phonetic change, "that *remus*, older *reamus*, and *ipissaw* have their probable origin in *vel* of *vell*, to pull," no more can be required to characterise the method followed by the author of this book. Dr. Key published some years ago an article in the Transactions of the Philological Society, "Queritur, the Sanscrit Language, as the basis of Linguistic Science, and the Labours of the German School in that field, are they not overvalued?"—a question, it would seem, very difficult to answer. Referring to it in the present work, p. 514, he says:—

"As to Professor Max Müller's assertion in the second series of his Lectures (pp. 13-14) that I am one of those who hold that 'there is no such thing as an Aryan or Indo-European family of languages, that Sanskrit has no relationship with Greek,' &c., I have difficulty in expressing my thoughts within terms of decency. The Professor, in support of his charge, refers to the paper 'Queritur,' just mentioned; but the whole of this paper assumes the very contrary. Thus he has to extricate himself from a dilemma of an ugly character—the bringing forward such an accusation, either without reading the paper to which he himself refers as his authority, or after reading it. The option lies with himself."

On referring to the passage thus violently incriminated, we read:—

"But while we are thus told by some scholars that we must look to Polynesia and South Africa if we would find the clue to the mysteries of Aryan speech, we are warned by others that there is no such thing as an Aryan or Indo-European family of languages, that Sanskrit has no relationship with Greek, and that Comparative Philology, as hitherto treated by Bopp and others, is but a dream of continental professors."

To this there is a note:—

"See Mr. John Crawfurd's essay, 'On the Aryan or Indo-Germanic Theory,' and an article by Professor T. Hewitt Key in the Transactions of the Philological Society. 'The Sanskrit Language as the Basis of Linguistic Science, and the Labours of the German School in that field, are they not overvalued?'"

It would seem to require but little acumen to see that the first sentences "that there is no such thing as an Aryan or Indo-European family of languages," and "that Sanskrit has no relationship with Greek," refer to Mr. Crawfurd, as quoted first in the note, and the last sentence to Dr. Key, as quoted last in the same note. Why Dr. Key should have appropriated the first sentences to himself, and left the one which was alone intended for him unnoticed, is difficult to explain. A man who has devoted the whole of his life to classical hermeneutics might surely have discovered the right and obvious interpretation of a not very difficult passage for himself. We have little doubt that Dr. Key—a gentleman, as he informs us himself, of the mature age of seventy-six—will deeply regret having written in his haste.

A YOUNGER brother of the distinguished archaeologist and historian, Professor Mommsen, well known by his edition of Pindar, and by his critical essays on the text of Shakespeare, has lately been engaged in the purely scholastic labour of ascertaining how often the preposition "with" is rendered in classical Greek by *μετά*, or by *σύν*. In the prosecution of this task Dr. Tycho Mommsen, has arrived at the conclusion that scholars have hitherto been in error with regard to two of the most ordinary words in the Greek language. After critically passing under review not only the entire range of classical Greek literature, but also the Septuagint, the books of the New Testament, and many writings of the later Byzantine school, he has established the important fact that the use of *σύν* with the dative is almost wholly restricted to the higher forms of poetry, and to the works of Xenophon, while *μετά* with the same case is reserved for prose, and for such forms of poetry as approximate most closely to it. This characteristic feature in the verbal structure of Greek poetry and prose had hitherto remained undetected. Dr. Tycho Mommsen thinks the schoolmen have done injury to the study of Greek, and obstructed the correct interpretation of classical literature, by leaving students to derive their knowledge of Greek prose so largely from Xenophon, who is deficient in the purity and harmony of the true Attic style. His essay is published in the "Programme of the Town-Gymnasium of Frankfort-on-the-Main," 1874.

PROFESSOR GOMPERZ is continuing his researches into the Cyprian and Hissarlik inscriptions. In a communication made to the Academy at Vienna, he gives a complete transliteration of the inscription of Idalion. He also suggests some improvements in the deciphering of the Hissarlik inscriptions. Instead of *Hilae* (ACADEMY, June 6, p. 636), he proposes to read *Hilaci*, *Ἰλαί*, to *Hilaeus*. Another Hissarlik inscription he reads as *ego to(i) gonei*, "I to the father;" and in analogy to this inscription, he now reads No. 3474, Tab. 190, *ego ta(i) patorai*, "I to the mother," an interpretation which he supports by very ingenious arguments, but which for the present must be considered as purely hypothetical.

THE eighth volume of M. C. Barbier de Meynard's edition and translation of El-Mes'ûdî's *Kitâb Murîj-edh-Dhahab* (Maçoudi, *Les Prairies d'Or*), has just appeared. It contains the history of the eighty years elapsing between the accession of El-Muhtedî and the fall of El-Mustekfi (255-334 of the Hijrah), and virtually terminates the work, for the three remaining chapters, which will form the concluding volume, contain only remarks upon the insurrections of the 'Alawîs (or 'Alides'), a chronological summary, and the list of the *Umarâ-ı-Hâjj*, or chiefs of the Pilgrimage, up to the year of the Flight 336, the date of the ending of El-Mes'ûdî's work. This volume, like the preceding ones, is full of curious anecdotes and rambling discursions, which bear upon Muslim manners and customs in a most important way. We look forward to the completion of the whole work next year with great satisfaction. M. Barbier de Meynard has imposed no small burden

of gratitude upon Orientalists by this as by his other works.

QUEENS' COLLEGE, Cambridge, has offered an entrance Exhibition of 40*l.* a year for the encouragement of Hebrew.

In the first number of the *Bullettino dell' Instituto di Corrispondenza Archeologica* for this year there is a full discussion of the Etruscan inscriptions in which the words Lantni (masc.) and Lautnitha (fem.) occur between a name in the nominative and one in the genitive; and Gamurrini suggests that these words correspond to the Latin "libertus," and "liberta," so that "Piuca lautnitha Nu" would be equivalent to "Piuca liberta numerii."

THE American Jewish Publication Society of New York will soon issue two new volumes. They will both be translations into English of Johnson's *Characteristics of the Semitic Race*, and Herzberg's *Family Papers*. The first publication of this society, the fourth volume of Dr. Graetz's *History of the Jews*, has met with fair success.

The Common Origin of the Languages of the Old World proved by a Comparison of the African, Erythraean, and Indo-Germanic Languages, with chief reference to Teda ["Der Einheitliche Ursprung der Sprachen der Alten Welt."] By Leo Reinisch. (Vienna, 1873.) Professor Reinisch is well known as an Egyptian scholar, and a mere glance at his book shows that he is a learned and hard-working man. But his book proves again how useless, nay, how mischievous mere learning may become, without a proper scientific method. Professor Reinisch has satisfied himself that the trilateral roots of the Semitic languages may be traced back to simpler bilateral or unilateral forms to be found in Egyptian, and in other Hamitic languages. Under the name of Hamitic he comprehends the Berber dialects in the North as well as the Bishari dialects in the East of Africa, also the Saho, Somali and Galla. But this is not enough. Convinced that the Egyptians came from Central Africa, he makes Central Africa the cradle of the whole human race, and derives from it the languages, not only of the Egyptians, but of all Semitic and Indo-European races. As the nearest approach to the original language of mankind he takes the Teda, a dialect still spoken in an oasis of the Libyan desert. An examination of a few pages, particularly of the notes which treat of Indo-European and Semitic words, will convince any scholar that no real progress can be made in the Science of Language, if the results obtained by special studies are disregarded by those who attempt the solution of larger problems.

The Inflection of the Verb in Latin. ["Die Verbal-flexion der Lateinischen Sprache."] By R. Westphal. (Jena, 1873.) This book, too, is disappointing. Dr. Westphal is too experienced a scholar to commit downright blunders. Whatever he writes is good, but it is not good enough: it is not finished and complete. His theory of the origin of grammatical forms is, if not totally wrong, at least one-sided. What is meant by the symbolic power of certain terminations, has never been explained: it is left as a mere matter of sentiment, instead of being reduced to any principle. The book was written in 1863, though published only last year. We hope that the learned and ingenious author will soon find leisure to write a book that will mark a real advance in Latin philology.

PROFESSOR E. MARTIN, of Prague, has completed his critical analysis of that most masterly of mediæval satires, *Vos Reinearde*, by the old Flemish monk or scribe, Willem. In this work, which is published by the Schöninghs at Paderborn (1874), Professor Martin gives the text of the older poem according to Jonkbloet's version, which he has compared with the scarce MSS. from which it was transcribed; while, in regard

to the later poems of "Reinaert's Historie," he has consulted not only the various fragmentary MSS. at the Hague, but also the early printed Cambridge copy, which, although it consists only of 222 verses, is yet of great value in regard to the restoration of various passages not to be found in any existing MS. A careful comparison of all the materials at his disposal has led Professor Martin to the conclusion that the older poem must be referred to a period slightly earlier than the year 1250, and that the author was not an ecclesiastic, but probably a scribe, who had been trained in a theological seminary, and possibly the same person who, in 1269, is spoken of as "Willemus Clericus" of Husterloo. The poem, which was composed for a lady, appears to have been derived by the author from an earlier French "Roman de Renart," and Professor Martin has been at great pains to show in how far the Flemish satirist deviated from his model, and incorporated in his version of it the substance of his own keenly realistic spirit of observation, giving life and individuality to the whole. No light is thrown, in the present work, on the origin of that later remodelled form of Willem's poem, which appeared about the year 1380, and as yet Flemish scholars have failed to ascertain the name of the author, or anything in regard to him, beyond the fact that he was a native of Flanders.

FINE ART.

Wallenstein: Sinfonisches Tongemälde, für Orchester. Von Jos. Rheinberger. Op. 10. (Leipzig: E. W. Fritsch.)

It is characteristic of our musical conservatism in this country, that there are a very large number of the prominent German musicians of the present day whose very names are almost unknown here. Wagner, Brahms, and Liszt of course we have heard of; and most of us probably know Joachim Raff, at least by name; but how large a percentage even of our artists knows anything about Rheinberger, Kiel, J. O. Grimm, Svendsen, Grieg, or Wuerst?—to mention the first half-dozen names that happen to occur to me. Yet they are at least as well known in Germany as those of Bennett or Macfarren in this country. It is proposed from time to time to call attention in the columns of the ACADEMY to some of the principal musical works published abroad, not so much in the hope that our concert directors may be thereby induced to bring them to a hearing, as because the progress of art should always be a matter of interest to art lovers, and this has not hitherto been fully and systematically recorded elsewhere.

The publication of the present symphony, which is beautifully engraved in full score, suggests the question, How is it that such a large number of full scores are published in Germany, while the appearance of a single one here is most emphatically "rara avis in terris"? It can hardly be that our English composers are less industrious than their German brethren. The programmes of the last few years of the Crystal Palace Saturday Concerts (at which Mr. Manns, to his honour be it said, though himself a foreigner, has lost no opportunity of producing English works) prove conclusively that our musicians have not been idle. It must be either that German publishers are more enterprising, and look less to pecuniary results than those in this country, or else that abroad there is a far larger number of score-readers, and therefore a larger demand for scores than is

to be found here. It is not improbable that both causes may be at work; but, account for it as we may, the fact remains that there are at least twenty (nay, probably fifty) full orchestral scores published in Germany for every one engraved in England.

Rheinberger's symphony is a comparatively early work of a composer who has up to this time published some sixty pieces in various styles. From its title—a "symphonic tone-painting"—it may be inferred that it belongs to the class of "programme music." Its four movements are respectively entitled, "Vorspiel," "Thekla," "Wallenstein's Lager und Kapuzinerpredigt," and "Wallenstein's Tod." It is so long since I looked into Schiller that I must plead guilty to only the vaguest recollections of his great drama; and therefore hardly feel qualified to pronounce an opinion as to the way in which the programme is carried out in the music. But altogether apart from this it is possible to speak of the symphony on abstractly musical grounds; and, after all, the more music can be disconnected from anything extraneous, and appeal to the emotions and the intellect simply as music *per se*, the greater the effect it is likely to produce. In the hands of a master, a tone-giant such as Beethoven, programme music undoubtedly may be made very effective; though it should be remembered that in the most striking example we possess from his pen (the Pastoral Symphony), he himself expressly describes it as—"mehr Ausdruck der Empfindung als Malerei"—more expression of feeling than painting. But to what vagaries composers of smaller calibre may be led by their desire to illustrate a definite programme in music may be seen by those who are curious in such matters in the score of Rubinstein's "Don Quixote," which may be described as a huge practical joke for the orchestra.

To return, however, to Herr Rheinberger, he cannot be accused of carrying realistic imitation to too great an extent in the present work, which, though it can hardly be described as evincing the highest order of genius, is yet thoroughly sound, well constructed, and never dry music. Its style is founded more upon that of Beethoven than of the more modern school, while passages are here and there to be met with from which it may be inferred that the composer is not unfamiliar with the works of Schubert. The only actual reminiscences, however, of his predecessors, are to be found in the first movement, an *Allegro con fuoco* in D minor, in which, curiously enough, they abound. This allegro, which is constructed on well-defined and interesting subjects, is in its leading themes original enough; yet in the course of its developments we from time to time come across phrases bearing a most striking resemblance to music which we have heard before. Thus, on page 18 of the score we find a charming cadence for the clarinet which irresistibly recalls a passage near the close of the slow movement of Schubert's Octett; a little further on (pp. 21, 22) is a passage to be found almost note for note in the *stretto* of Beethoven's great "Leonore" overture; the following subject, page 23, forcibly reminds us of the opening theme of Beethoven's great "Rasumouffsky"

quartett in F, while its continuation (pp. 25 to 27) must have been unconsciously suggested by the first movement of the Pastoral Symphony. On the other hand, this allegro contains much that is both fine and new; especially good is the episode on page 35, of which much use is made in subsequent developments. Still, on the whole, this portion of the work is too suggestive of Beethoven to afford unmixed gratification, and is on that account inferior to the rest of the symphony. It is very amply, almost too amply, developed; indeed, Herr Rheinberger is not altogether free from the fault of diffuseness which so largely characterizes the greater portion of modern German music. The second movement of the work, "Thekla," *adagio non troppo*, in B flat, is charming throughout, constructed on most melodious subjects, and set off by tasteful orchestration. It is as a whole far superior to the first movement, though even here one is not altogether free from the impression of undue length. The third movement, "Wallenstein's Lager," which takes the place of the scherzo, is a march movement, in which, in addition to the ordinary full orchestra, military instruments (bass drum, cymbals, and triangle), are introduced. Here the subjects are excellent, full of spirit, and well treated; but the same want of conciseness to which reference has already been made shows itself again. The trio entitled "Kapuzinerpredigt" is quaint and interesting as music, though it requires a vivid imagination to trace the connexion between the theme and the title. The finale, "Wallenstein's Tod," a *moderato* in D minor, followed by an *allegro vivace* in the major, is on the whole the finest part of the work. Themes and treatment are alike excellent, and though very long the interest is fully maintained to the close. The movement is somewhat in the "fantasia" form, the changes of time and rhythm being frequent; but the feeling of unity is preserved, and the impression produced by the whole is satisfactory. All composers are aware that the finale is the most difficult part of any composition, and the fact that just in this point Herr Rheinberger should have been most successful speaks not a little for his ability.

A commendable feature of the entire work is its perfect clearness. From the first bar to the last the composer is never vague; he always knows what he has to say, though one may occasionally wish that he would not take so long to say it. He has abundance of ideas, and appears also to possess complete freedom in the technical handling of his material; and, so far as can be judged from a single work, he must be ranked as among the best of modern German composers, though, as already intimated, "Wallenstein" does not reveal the very highest order of genius.

EBENEZER PROUT.

THE EXHIBITION OF RELIGIOUS ART AT LILLE.

Bruges: July 6, 1874.

The Exhibition of Works of Religious Art, now open in the Ancien Hôtel de la Préfecture, at Lille, is in many ways remarkable. Unfortunately there has been no attempt at classification, and works of art of every description are mixed up together in a manner that is very wearisome to the student; moreover, the committee, having

ample room at their disposal, have apparently admitted everything offered them, so much so that at least one-third of the objects exhibited are not worth even a passing glance. Had fewer objects been admitted, and these properly exhibited in suitable cases, the exhibition would have been far more attractive and interesting. The catalogue, except in so far as made up of extracts from other books, is almost worthless; the authorship and date attributed to many objects being simply absurd, and the descriptions occasionally even verging on the ridiculous, e.g. Nos 424, 494, 503, 1131, 1263, 1353, 1355, 1357. Many of the objects exhibited are not mentioned in the catalogue.

The section of manuscripts contains a few fine specimens. Of especial interest is a small quarto (7), the first portion of which contains twenty-two full-page miniatures by an English artist of the fifteenth century, unfortunately merely sketched in outline, the parts in gold being alone completed. Of these miniatures, St. Veronica holding up the Vernicle with two angels incensing, the Ascension, and St. Michael weighing a soul for whom the Blessed Virgin is pleading, are amongst the most remarkable; another curious composition represents three angels sustaining the Heart of the Redeemer, which the blind Longinus is in the act of piercing. The second portion—containing a calendar, the Office of the Blessed Virgin, penitential psalms, and Litany of the Saints, with small miniatures, initial letters and borders—is apparently the work of an artist of the North of England. The arms of the original proprietor and of his wife occur several times, these are (1) *gu. a fess arg.*, accompanied by three stars or two and one; and (2) *arg. a fess gu.*, accompanied by three clover leaves *az.* two and one.

Other noteworthy manuscripts are—the Old Testament (1), one of two volumes written by Goderannus, monk of the abbey of Lobbes, in 1084, containing twenty-eight miniatures and some initial letters of great character. Three manuscripts of the Apocalypse, one Anglo-Norman (38) of the thirteenth century, with seventy-three miniatures; another of c. 1360, with eighty-six miniatures, lent by the Seminary of Namur; and the third of the fifteenth century, with sixty-five miniatures. A *Pontificale Romanum* (5) with miniatures by an Italian artist of the fourteenth century. A Franciscan Breviary (32), fifteenth century. A French translation of Aristotle (72), c. 1360, with splendid miniatures, and several Flemish manuscripts, belonging to M. van der Cruisse de Waziers, of Lille. A copy of the Amiens missal (70), printed at Rouen in 1506, the prefaces and canon in manuscript, with four full-page miniatures, one representing St. Francis receiving the stigmata, and F. van Halemyn, sixty-fourth bishop of Amiens, kneeling at a *prie-Dieu*, forms a connecting link between the manuscripts and a very fair collection of early-printed French *Horæ*.

Among the specimens of goldsmiths' work especially worthy of note are—a portable altar of Oriental alabaster, the border adorned with ten cloisonné enamels representing Christ, the Lamb, the Blessed Virgin, St. Faith, and the evangelistic symbols; another of porphyry with niello inscriptions and date 1106; the sides covered with plates of silver, on which are twenty-two half-length figures of Christ, the Blessed Virgin, and saints in niello, both from the Abbey of Conques; a third, mounted in copper, with engraved border of foliage, early thirteenth century, from the cathedral of Namur.

The Abbey of Conques also contributes an A, said to have been given by Charlemagne, but perhaps of later date, which probably was originally meant to be suspended as pendant to an Ω from the upper arm of a two-branched cross. It is of wood, covered with silver plates, one face being covered with filigree work and crystal cabochons, the other with cloisonné enamels, filigree work, and an antique intaglio of Victory. At some later period the two limbs of the A have been

united at their base by a horizontal bar with two figures of angels with thurible and vessel of incense, of the twelfth century.

Here are also to be seen the well-known foot of the cross of the Abbey of St. Bertin (452), adorned with splendid Rhenish (more correctly Lotharingian) champlevé enamels of the twelfth century; an enamelled cross of similar style (504), without its foot, from the Abbey of Liessies; a double-branched cross, c. 1250 (500), from the Abbey of Clairmarais, set with relics surrounded by filigree work, the reverse with niellos representing Christ crucified, the Blessed Virgin, St. John, Adam rising, and the Evangelistic symbols. Another reliquary cross (501), from the Abbey of the Paraclete, of the thirteenth century, is richly adorned with filigree work, champlevé enamels, and engraved figures of Christ in glory, holding the globe in his right hand and the cross in his left; Christ crucified, and Adam rising from the tomb. Two altar crosses of the twelfth and thirteenth centuries, from Arras (451), and Boulogne (450), are also worthy of note.

A fleurdelysée crown (502), the hoop set with relics protected by crystal cabochons, alternating with translucent enamels, and the fleurs-de-lys with pearls and jewels, is a fine specimen of thirteenth-century work, contributed by the Bishop of Amiens; it belonged formerly to the Abbey of the Paraclete, as did also a vase (503), of very chaste design, with a duodecagonal foot. The Cathedral of St. Omer has lent a lovely little pyx (466) of the commencement of the thirteenth century, adorned with filigree work and jewels. The show of altar vessels is, however, poor: there is only one chalice of note (470), and that more on account of its remarkable size and peculiar style than for any great artistic merit. A monstrance of the seventeenth century (453), from Roelux, is a good specimen of the date.

Among the reliquaries are a large shrine with statuettes in silver, from Caudry; a *brachiale* of the thirteenth century, with niellos and filigree work; another of wood painted, with copper-gilt mountings set with stones; another (438) dated 1438; another containing relics of St. Hilary, given in 1518 by Charles de Croix, Prince of Chimay, and his wife Louisa de la Bret, sister of the King of Navarre. The church of Maubeuge contributes a reliquary monstrance of the fifteenth century (494), one of the finest specimens of its class: from the centre of an oblong base terminating at either end in a trefoil, rises a stem surrounded by architectural work of great delicacy; above the knop the stem branches off, taking the form of a double crook, the volutes of which support a horizontal crystal cylinder mounted in silver gilt. Two standing figures of angels in albs with outstretched wings sustain the extremities of the cylinder, surmounted by a canopied niche in which St. Aldegond is represented kneeling and receiving from a dove the veil preserved in the cylinder beneath. The face and hands of the saint and the angels are delicately painted. Other noteworthy reliquaries are: an enamelled shrine (435) of the twelfth century; a fourfoiled elliptical phylactery (477) of the thirteenth century, in which is enshrined a tooth of St. Nicolas surrounded by engraved foliage and filigree work set with stones; the reverse covered with a silver plate on which the Lamb of God is represented in repoussé work. A silver-gilt reliquary from the church of Beauchamps with statuettes of the Blessed Virgin and two saints, and an enamelled shield, also deserve mention. Another object of interest is a small monstrance in the form of a cylindrical crystal cross, supported by a circular foot, surrounded by a crown of thorns and surmounted by the Holy Name, in silver gilt adorned with translucent enamels. On the foot is this legend: + HÆC SPINA DE CORONA DŌI SANCTA FUIT PRIMO MARIE REG. SCOT. MART: AB EA DATA COMITI NORTHUMB. MART: QVI IN MORTE MISIT ILLAM FILIE SVÆ ELIZÆ QVÆ DEDIT SOC. HANCQ. I: WILL: ORNAVIT AYRO. This is one of the

two thorns that belonged to Mary Queen of Scots. They were given by the daughter of the Earl of Northumberland to the provincial of the English Jesuits, and were long preserved at Watten. This one in 1763 was transported to Ghent, and belongs now to the church of St. Michael in that town; the other to Bruges, enshrined in an enamelled gold reliquary set with pearls, is at the college of Stonyhurst.

The church of St. James at Amiens contributes a beautiful figure in copper gilt of St. Nicolas, in full pontifical vestments, seated on a faldstool; by his side the tab, out of which are rising the three students whom the bishop is blessing: this is a fine work of the fifteenth century. Another fine silver statuette, from the cathedral of Namur, represents St. Blaize standing on an octagonal base. He is vested in chasuble, &c.; the mitre and episcopal staff are additions of the fifteenth century. The same church contributes a fine silver parcel-gilt triptych, enriched with most exquisite translucent enamels of the fourteenth century.

Here are also some fine episcopal and abbatial staves; the earliest specimen is that of St. Malo, bishop of Aleth in Brittany, of the sixth century, composed of pieces of ivory united by bands of copper gilt. From St. Omer there is an exquisite specimen of the thirteenth century, in copper gilt, terminating in a dragon's head, the crook and knob adorned with niello ornaments; from Maubeuge a staff in carved wood, with copper gilt crook, ornamented with foliage, apparently of the fourteenth century; another, of silver gilt, and enamelled (496), with statuettes in niches, of the end of the fifteenth, from the collection of M. de Beaufort.

The well-known "thurible of Lille" (505), a globe of pierced work resting on a simple hexagonal foot, the cover surmounted by an angel seated in the midst of the Three Children, is a choice work of the end of the twelfth century.

We must not omit to notice an ivory statuette of the Madonna of the fourteenth century (619), beneath an elegant canopy with folding wings on which are carved the Annunciation, Visitation, Nativity, Presentation, and the Three Magi; a statuette in oak (671) from the Lower Rhine, c. 1520, representing St. Catherine trampling on the Emperor Maxentius; a finely-carved coffer (550) of the fourteenth century, with subjects and figures of saints, and an extensive collection of seals, medals and pilgrims' badges.

Among the most interesting ecclesiastical vestments are a chasuble (313) given by St. Thomas of Canterbury to the Abbey of St. Medard, at Tournay, which still preserves its original ample form, adorned with narrow orphreys of Sicilian manufacture. Another, from Maubeuge (413), of an Oriental stuff of pink silk and gold, of very unusual design, probably of the tenth century, with narrow gold orphreys of Sicilian manufacture, has unfortunately been mutilated. The church of St. Michael at Ghent contributes a chasuble, the cross and column of which are beautifully embroidered with scenes from the life of a saint, fifteenth century. A chasuble of red silk diapered with the Holy Name, with heartseases, violets, and tongues of fire, the cross very narrow, with a finely executed figure of Christ crucified, has unfortunately lost the pearls which formerly adorned it; this chasuble was executed at Antwerp in 1500. The churches of Hazebrouc and of St. Maurice, at Lille, contribute vestments with embroidered orphreys of about the same date.

Among the specimens of altar-hangings are a fine frontal (297), embroidered with full-length figures of the Madonna and twelve Apostles, Burgundian work of the fifteenth century; a tapestry frontal (310), representing the Adoration of the Shepherds, with a kneeling figure of the donor; and another, embroidered in high relief, of the eighteenth century (311), from the church of St. Vedastus at Bailleul, representing the Adoration of the Magi and Shepherds.

Here are also a series of five paintings on coarse linen *al sugo d'erba* (229-233), representing subjects composed by Raphael for the tapestry hangings of the Sixtine Chapel, among which is the Conversion of St. Paul, the cartoon of which is lost.

The frame of a picture (1130) of the Saviour, with the donors kneeling accompanied by their children, and protected by SS. John Baptist and Barbara, is a good example of a class of decorative work, examples of which are seldom met with: the sides are occupied by twelve figures of prophets in canopied niches; and the upper part by nine angels with three scrolls bearing legends. Among several hundred paintings are a curious series (1121 to 1129), given to the cathedral of Amiens by masters of the confraternity of Puy Notre Dame; the *Mass of St. Gregory* (1350), a portrait attributed to Christopher Amberger (1352), a delicate interior of a church by van Steenwijck (1310), a *Vanitas* signed "David Baillij pinxit A° 1651," and a *Descent from the Cross* (1277), by Quentin Warin of Beauvais, the master of Poussin.

This exhibition will be closed at the end of the present month. W. H. JAMES WEALE.

RE-OPENING OF THE EXHIBITION AT THE CORPS LÉGISLATIF.

(Second Notice.)

Paris: July 1, 1874.

I acted prudently in not sending you a general article on the day of the re-opening of the Exhibition. Several cases, indeed several rooms, were only given to the public some days after. The arrangement is now complete. The second series will, perhaps, not bring in as much profit as the first, because the curiosity of the Parisians is exhausted, and society is beginning to leave town; but it is hoped that people from the provinces, whose children's holidays begin shortly, and foreigners who visit France just when the sun, the bright summer verdure, and the fruits deck her with her richest physical attractions, will help in their turn to fill the coffers of an undertaking which seeks to soften the most cruel position that men can occupy—exile voluntarily undergone.

I shall say but little of minor objects and curiosities: they are numerous, well-chosen, and varied. But precisely because of the interest that they excite, one cannot now speak of them in summary terms. No one but a specialist should take up his pen to write of ivories, enamels, specimens of glass and tapestry, arms, and carvings in wood; and to tell his readers what are the qualities which place such or such an object above or below the average of its class. Such a task I cannot undertake. I should think it out of place when addressing a journal which, like the *ACADEMY*, judges of things in their general bearings, and characterises details by a few short strokes. One must keep to the pursuit of beauty, unshackled by the special conditions of learning and science.

I will proceed to indicate very briefly the contents of the cases that the visitor comes to after crossing the vestibule, in the midst of which stands a Julius Caesar in bronze, modelled in Italy some years ago by M. Clésinger, at Rome, in the very presence of the ancient originals.

In gallery No. 2 are ancient objects of Jewish worship, belonging to M. Strauss; Japanese bronzes and ivories, belonging to the present writer; Sèvres porcelain, the property of M. L. Double, who has, in other galleries, a very choice selection of furniture of the eighteenth century; arms, enamels, ivories, and crystals—a first-rate show contributed by a wealthy retired dealer, M. Spitzer; objects of ordinary life, knives, forks, and spoons, violins, and fifes, lent by M. Achille Jubinal; specimens of Saxony porcelain, by M. Sapia; drawings by Clouet, Demoustier, and T. M. Moreau, belonging to different amateurs; and lastly, paintings of various schools.

On re-entering the long gallery on the right, the visitor sees in the centre the *Child with the Bunch of Grapes*, a sculpture by David d'Angers, and *Aeneas bearing Anchises on his Shoulders*, a sculpture of the school of Puget. In the cases are MSS. belonging to M. Feuille de Conches and M. Firmin Didot. On the wall are portraits, some of which are lent by the Academy of Medicine.

In the rooms opening on the court of the Palace and not on the garden, almost all the objects exhibited are new, consisting of furniture and busts of the French and Italian Renaissance; Rouen earthenware, belonging to M. Maillet du Boulay; Flanders or Gobelins tapestry; or Boule furniture, among other pieces an admirable bookcase of black wood, inlaid with enlaid copper, sold some time since to M. de Grefuhle by M. Spitzer. But, I repeat, I wish to confine myself to general indications. In England, the South Kensington Museum; in France, the Louvre, the Museum of the Hôtel Cluny, and, above all, the sale rooms, with their ever-changing contents, of the Hôtel Drouot, have placed curiosities within the reach of all students. Publications of all kinds, and catalogues better and better prepared, have given the public indications, general or precise, with regard to all the objects of all times and all countries. The public is tired of objects that are common or second-rate. It is therefore specialists of all nations above all who should be invited to pay a visit to this exhibition, and probably international communication has made them already aware of it.

In this room is a really admirable statue lent by the Luynes family, which to the present day had remained concealed from all eyes save those of intimate friends, in the château of Dampierre at Chevreuse. It is "Louis XIII. in his youth," by the French sculptor Rude. It was cast in silver in 1842. It occupies a kind of chapel at Dampierre, built and decorated by the architect Duban, by order of M. Albert de Luynes, for the express purpose of receiving and showing to the best advantage the figure of the King who was the benefactor of his family. On opening the curious journal of the health of Louis XIII., written every evening by his physician J. Herouard (published in two volumes octavo, by Messrs. Firmin Didot), you will see that on Monday, December 28, 1611, Louis had been put to bed at half-past nine, and slept till eleven; that he began to cry in a loud voice, half-asleep, "Oh! qu'il est beau, qu'il est beau, le leurre, le leurre, Luynes, Luynes!" a gentleman, adds Herouard, who kept his merlins. Such is the first indication in a private memorandum of the influence of Charles d'Albert, who became by degrees the counsellor and the right arm of the young king, who planned the murder of Marshal d'Ancre, and became Constable of France. He was then thirty-three, and the child nine. He had charge of the domestic birds, and knew how to make the little birds fly about the chamber and the galleries by means of trained *pies-grièches*.

Rude has represented Louis XIII. at about the age of fifteen: he is walking, carries a hazel stick in his hand, and wears a doeskin glove, and boots also of some fine skin, which show the form of the leg to above the knee. The other hand rests on the hip. Round his neck he wears a large ruff. The face, round, full, a little haughty and timid, rises above the long locks that flow down to the shoulders. A large round hat with plumes is set a little on the back of the head, and from the point of view of sculptural arrangement forms a *repoussoir* for the face, which thus presents itself in full light.

This statue is one of the finished masterpieces of the modern school. It has the nobility and grace of a person of high rank, in all the brightness and in all the charm of an age whose calm enjoyment is as yet untroubled. The young King thinks of nothing but his youth, his pleasure, the wish of the moment, the pleasure of being well-

dressed, of exercising his young energies in the chase without constraint. Never since the friezes of the Parthenon has any artist better expressed the suppleness and somewhat wild fatuity of the young human animal, and—but I fear I may be thought wanting in respect—of that particular variety of the human race which furnishes peoples with their shepherds. The costume is worn with an ease which at first view makes the spectator think that it is a copy of a contemporary painting of the beautiful young boy it represents. M. de Luynes was delighted with this statue, which Rude had only agreed to make on condition that he should show no sketch, should let no one enter his studio, should receive no advice. He had promised the sculptor 6,000 francs, and made him accept 10,000. The statue is just as it came from the casting, without any further alteration than a few unimportant strokes of the graver on the black watered-silk ribbon over the breast. The casting cost from 7,000 to 8,000 francs. The silver is worth about 16,000 francs. M. de Luynes has not allowed either moulding, or drawing, or photograph of it to be taken. It must be seen before it is restored to its solemn solitude at Dampierre by whoever wishes to pay his homage to one of the simplest and most attractive manifestations of modern naturalistic sculpture.

There are many instances of the shifting of public admiration in this Exhibition. I do not speak of works by the old masters. It would carry me too far, and our museums are receptacles of choice works which allow the critic to judge them more equitably. Yet one may assert that the voice of public opinion grows more and more severe with regard to easel pictures of the Italian school. Thus, the *Virgin of the Family of Orleans*, which is undoubtedly from the hand of Raphael, and which belongs to the collection of the Duc d'Aumale, would formerly have been the pretext for a crush. Now this little panel is re-regarded as a work full of high promise, but still without individual accent. Perhaps people go too far. The Virgin's face is assuredly less touching, less simple than that of the Virgins of Perugino; on the other hand, the body of the Bambino is modelled with a force of relief, a warmth in the contours which the early painters had not derived from their still timid studies of nature. It has not the same intimate beauty of expression as many oratory pictures, but it gives a foretaste of the great, the valiant decorator of the Roman School, who has transmitted to none the secret of his design, at once so natural and so heroic, so exact and so full.

Decamps is one of the moderns who lose much in this Exhibition. All agree in finding him black, bituminous, without transparence. One of his most famous pictures is here, a *Café at Smyrna*, belonging to the Duc d'Aumale. It does not answer to its reputation. Decamps in reality hardly saw Asia Minor. He only stayed there a few months. He was seduced by the picturesque costumes, and especially the rags. He looked at the jackets and breeches, the daggers and pistols, rather than at the people. In the same way he sought rather for the abrupt opposition of sun and shadow than for the delicate gradations of reflexions and half-tints. Now he pays the penalty. We see but too well that the greater part of his landscapes were composed with motives borrowed from the Forest of Fontainebleau and the neighbourhood of Toulon; that his types of Turks and Arabs were painted at Paris after models which he dressed with costumes brought from the country. This strikes a false note, while the bitumen which he heaped on to contrast with the pure white which he spread with the palette-knife has grown to positive blackness, and conveys an impression very different from the mysterious depths of Rembrandt, or the fleeting reflections of Eugène Delacroix.

I will speak another time of Eugène Delacroix, who has here one of his masterpieces of movement and poetry, the *Assassination of the Bishop*

of Liège by Guillaume de la Marck. His work assumes higher importance day by day in the estimation of men who are really sensible of the higher qualities of art. It is the same with the landscape painter Théodore Rousseau. Your critics might come and take valuable notes on this master. Ten of his paintings have been collected here, some of which, as the *Alley of Chessnuts*, rejected by the jury of the Salon of 1834, are masterpieces. The rest belong to little-known collections, and have produced the greatest effect. No modern landscape painter in our school has shown a greater perception of design and composition. He is a great classic.

I have just written of Théodore Rousseau, "he is a great classic." My pen has made a start as if it was a vulgar pen torn from an academician's wing. Yet this start has made me reflect awhile, and it is with a twofold feeling of sadness and of consolation that I shall end this letter.

Do not view my words in the light of a challenge. They are the brief expression of the feelings of the modern public toward this master, so long despised, persecuted by unworthy cabals, who, had he died five years earlier, would have known nothing but the blows, insults, and bitterness of conflict. The Institute persecuted the romantic school, and especially Théodore Rousseau, with an obstinacy that free England will never be able to understand. And in whose name? In the name of an artist whose qualities as a designer are beyond dispute, but whose qualities as a painter and composer are so null, so negative, that one is driven to ask how such a mystification could have triumphed so long.

It is of Ingres that I would speak, of Ingres, whose defeat is here so complete that his most faithful admirer, M. Frédéric Reiset, has not dared to let his pictures remain on view during the second part of the Exhibition, among others the famous *Venus Anadyomene*. The *Spring* alone meets with some favour, but favour of a lukewarm sort, such as was shown towards it when it appeared at your Universal Exhibition of 1862. It is criticised, not without reason, as commonplace in expression, and involved in the lower extremities. *Oedipus consulting the Sphinx* has good bits of study, but David, without trouble or sweating over his canvas, has painted many others. *Stratonice* is scarcely superior to the *Massacre of the Duke of Guise*, by Paul Delaroche; and again, Paul Delaroche would never have employed such violent reds and harsh greens. The wearisome and paltry archaeology of this picture, which is saved, however, by the tragic and feverish bearing of the young man, who is casting a glance of love and death on his mother-in-law, has been the starting-point of all the pseudo-Greek and pseudo-Roman archaeology of M. Gérôme. What a gloomy school! What a disastrous system of instruction is this eternal transmission of formulas! What an abandonment of all chance of fresh life in drawing, in composition, in imagination! What a fatal enlistment of all mediocre talents, all undecided characters, all hypocritical weaknesses, to form an army which should seize all positions, drive out all who will not truckle, crush all originalities. The French school was near perishing. It is the public good sense which is in a fair way to save it. Ingres, to repeat with variations a witty saying, was invented to be the bread of the Professors and candidates at the Institute.

Yet how great was the school that sent him forth! But he could not draw from it the higher teaching, which is the incessant study of nature, under the influence of breadth of mind and right feeling. David, his master, crushes him here by the neighbourhood of two portraits of young women, two sisters, Mesdames d'Orvilliers, the one a laughing brunette, the other a blonde of a more serious turn. What a chaste and delicate feeling for female beauty! What a bright palette! What a free and simple touch! This poor Ingres, even in his *Berlin*, seems like a convict, painting

with a brush of iron wire in the grey light of a cell. David in 1790 painted these two beautiful young women, with all the freedom of an artist who is master of his doctrine, master of his means, master of his models. These two portraits are the great success of this Exhibition, and are alone worth the journey for whoever wishes to judge of the French school.

In spite of the neighbourhood of these paintings, the solidity and bold relief of which delude the senses, Ingres nevertheless remains a master with whom one will always have to reckon. His drawings after nature, lent by the Museum of his native town of Montauban, reveal a concentrated and original nature, a passionate student, endowed in the choice of detail with a taste worthy of the Greek artists. His part in the future will be twofold: you find in Museums paintings which are almost comic, such as the *Maréchal de Berwick receiving the Gold Collar*, and in the artist's ateliers studies after the model showing an accent, a style, a distinction, which place him beside the early Italian masters, and which are superior to David's study-drawings. He had the gift of feeling for beauty, but his understanding was below the level of that mission which consists in making use of form to express feeling. PH. BURTY.

THE FABRICATION OF ANTIQUES.

WE have already drawn attention to the dangers which beset unwary and uninformed travellers in the East, in being led to purchase spurious antiques, palmed off upon them as genuine, but which have in most cases been manufactured on the spot to satisfy the growing taste for archaeological remains. The success which has attended this branch of questionable industry has given such confidence to its prosecutors, that, instead of hiding their operations in isolated and covert localities, they have carried the scene of their labours into the most important cities of the East, scarcely one of which is now without its manufactory of ancient relics. Dr. A. D. Mordtmann, who tried in vain to save the Berlin Academy from falling into the snare set for them by the expert Greek manuscript forger, K. Simonides, has lately written from Constantinople, warning the readers of the Augsburg *Allgemeine Zeitung* of the nefarious traffic going on at the present time in the Turkish and Greek dominions in false coins, statues, ornaments, arms, and written documents of every kind. He informs us that one of the most successful manufactories in Constantinople is devoted entirely to the fabrication of coins of the time of Constantine and his mother. The first step in the process is to oxydise bronze plates, made by an ordinary coppersmith, after which they are decorated with the serpent-twined column, the obelisk on the Hippodrome, the heads of the Emperor and Empress Helena, and various other well-known characteristics of the period, and when sufficiently corroded and chipped to meet the requirements of their supposed origin, they are offered for sale by confederate dealers in antiquities, who profess to have obtained them from workmen engaged in pulling down old houses near the Hagia Sophia. The inscriptions are usually made up of disjointed Greek and Latin letters incapable of being reduced to legible words. A few years ago a Greek trader sold some specimens to the Russian Governor-General of the Crimea, who forwarded them to St. Petersburg, where the committee of the Archaeological Museum took the precaution of writing to Constantinople to enquire into their authenticity, and thus escaped being duped; but the supply is by no means exhausted, for in the course of the present year some have been offered for sale to Dr. Mordtmann. It is not improbable, therefore, that some of these precious objects may at present be on their way to our shores, for we learn from the communications of Dr. Mordtmann that a Cappadocian trader of Constantinople, named Agob, and supposed in this case to be rather the duped than the duper, is

making the tour of Europe, provided with an enormous quantity of false coins, which he offered for sale last summer at Vienna during the time of the Exhibition. Athens, it would seem, is not behind modern Byzantium in the arts of spurious fabrication, and, if report does not belie him, a certain Greek monk is at present doing a good business in Athens by manufacturing ancient Greek coins. Their composition has been regulated by such profound numismatic knowledge that it requires much learning and very great technical experience to distinguish them from their genuine prototypes. This ingenious ecclesiastic shows his knowledge of human nature by choosing his agents among herdsmen and shepherds of the provinces, from whom tourists and scientific explorers have the opportunity afforded them of purchasing objects that certainly could not be obtained in Athens itself, where they are never offered for sale, although it is known that they are carried by special emissaries to Constantinople and some of the larger capitals of Europe. Shiraz, in Persia, rejoices in a skilled coppersmith, called Dscherad, who can reproduce to perfection any Mohammedan gem or coin that the travelling connoisseur may desire, and he is thus able to extract from the pockets even of not wholly ignorant collectors as much as forty ducats for a silver coin made in his own manufactory to represent the genuine piece struck for the Khalif Ali. Bagdad sends forth gems on which Sassanian busts and Pehlevi inscriptions are reproduced with masterly skill. One of these represents King Hormuzd I., and was copied from the genuine stone after its purchase by Omar Pasha from the original owner, Madame Prokesch. The only difference in the copy was that half of the legend had been left out, and an eagle substituted in its place. Dr. Mordtmann states that one of these gems came twice into his hands, and that on the second occasion, after having been carried to Damascus and Jerusalem, it reappeared at Constantinople, with the addition of six letters to the inscription which it had previously borne. The learned German professor is deeply concerned at a report which has been conveyed to him, to the effect that the British Museum has purchased some of these well-made Bagdad antiquities for the sum of 2,000*l.*, and although he trusts that two of the ducats may at all events be referred to Eastern hyperbole, he is of opinion that if the authorities of our national Museum paid only 20*l.*, they have undoubtedly been swindled to that amount. He draws attention to the fact, that although the Pehlevi characters are admirably done, they never admit of being reduced to legible words, much less to sense.

Dr. Mordtmann some time since again wrote to the *Allgemeine Zeitung* to draw attention to the increasing daring with which the fabrication of spurious antiques and their sale are being prosecuted at Constantinople and in other eastern capitals. The evil is undoubtedly assuming very considerable dimensions if we are to accept Dr. Mordtmann's assurance that the greater part of the collection recently purchased in the East by no less a connoisseur than the Count de Gobineau, and described by him in the *Revue Archéologique* (Mars 1874), consists of modern or other spurious stones and medals. One of the stones, No. 273 on the plate, bears in Pehlevi characters the inscription *Palikari Hassan*, and thus contrives to blend together modern Persian, modern Greek, and Mohammedan elements in one pretended antique. The cameiform characters inscribed on some of the gems are, moreover, said to be drawn with a want of exactness that could only deceive those who were thoroughly ignorant of them; while some of the stones and tablets are flagrantly evident copies of the rock-carvings at Uejuik in Asia Minor.

Dr. Mordtmann especially warns collectors of a spurious gem fabricated by Persians, and at present being offered for sale at Constantinople. It is elliptical in form, and represents the right side

of the head and bust of a monarch, with beard and hair cut in the Assyrian style, with a large pendant in the ear, and wearing a pointed Scythian cap. The inscription, consisting of two rows of beautifully and correctly cut Pehlevi characters, is as follows:—

Malkan Malka Iran Rastichi Parsum
Rim Schahran iathi Nasridachai.

The three first words signify "King of the Kings of Iran," for which the artificer may have found many patterns. The remaining words mean "the just Parsum," and may, Dr. Mordtmann conjectures, have been copied from his own work, *On Stones carved with Pehlevi Legends*, or from the *Journal of the Royal Asiatic Society*, vol. xiii. It would appear that the resemblance between the personal name "Parsum" and the word "Persian" led to the adoption of this legend; and, if so, it further proves that the fabricator was a European, or at least not a genuine Persian of Isphahan, since all natives call their country Iran, and use the word "Pars" merely to indicate one of the provinces of Persia. The second line would seem to be a more original, but less felicitous specimen of artistic patchwork: *Rim* being the Turkish for "Rome," *Schahran* probably a mistaken rendering of *Schahriar*, monarch, and *iathi* a translation of "who." Thus, then, the entire inscription would have to be rendered as follows: "The King of the Kings of Iran, the just Persian, the monarch of Rome, Nasridachai"! The last word seems to be a false rendering of "Nassreddin," the name of the present Shah of Persia. Such is the interpretation given by the learned German professor of this ingenious patchwork specimen of numismatic art, which is at present being offered for sale at Constantinople for the modest sum of 2,000 fr.

ART SALE.

At a sale of prints, held on Saturday and Monday by Messrs. Sotheby, Wilkinson, and Hodge, some etchings by Claude were disposed of. One lot, consisting of two prints—*A Wooden Bridge* (second state), and a third state of the *Sunset* (No. 15 in Robert Dumesnil's catalogue)—fetched 13*l.* Messrs. Holloway purchased, for 23*l.*, a first state of Claude's *Campo Vaccino*. Of Albert Dürer's work, a *Melanchoha* was sold to Messrs. Colnaghi for 40*l.*, and a fine impression of his *Adam and Eve* to Messrs. Ellis and White for 53*l.* Of Lucas van Leyden's work, there was sold, for 30*l.*, a *Conversion of St. Paul*. Marc Antonio was richly represented by many things which fetched high prices. A remarkable impression of this master's engraving of *Adam and Eve* realised no less a sum than 485*l.*

NOTES AND NEWS.

LEICESTER SQUARE, swept and garnished by Baron Grant, presents an appearance compounded of the second-rate French *place*, and the third-rate British pleasure-ground or tea-garden. But London must be grateful for what it gets, and glad to have cleared away a long-lingering eyesore. In the centre stands a reproduction of the best-known statue of Shakspeare, superintending four water-spouting dolphins: not a very intellectual or happy combination. At each of the four ends of the enclosure is a bust of a celebrated resident of Leicester Square: this was a highly reasonable and apposite form of sculptural adornment, and the men singled out are more than worthy of the selection. By far the best of the four, as a work of art, is the Hogarth by Mr. Woolner—very bold and life-like, with a face which seems to challenge every person and object that it scrutinises—a fighting man in the lists of art. The costume of the time is slightly indicated, and effectively managed. Newton, by Mr. Calder Marshall, has an aspect of calm introspective thought; so far the bust is approvable, but it does not reach a high point of either expression or execution. Reynolds is by Mr. Weekes,

and is represented in his presidential hat and gown. The handling is skilful, and the half-opened mouth and other facial details show us at once who is portrayed; the sidelong glance, however, seems rather wanting in apt significance, and the nose is more firmly moulded than that with which Reynolds, in his own portraits, has credited himself. In these three busts the eyes, with eyeballs and pupils, are fully sculptured. In the fourth example—Hunter, by Mr. Noble—only a slight elevation of surface indicates the eyeballs. This leaves the head less vivid and telling, and in other respects we think Hunter the least satisfactory work of the four. He has a somewhat puffy, loose-fleshed look, and reminds one altogether, if partly of Hunter, partly also of Charles Kean: the bust is bluntly stuck on to its pedestal, without anything to be called composition.

AN Exhibition comprising the works of art belonging to the Municipality of Paris which were in the Salon of the present year, together with those purchased at the close of the Salon, and some completed since 1870, is now on view in the Salle de Melpomène at the Ecole des Beaux-Arts. The last-mentioned class includes two pictures by Tony Robert Fleury, for the church of St. Bernard; two models of angels, by Falguière, for the church of St. Francis Xavier; the models of two statues for the new prefecture of police, by Chapu and Gruyère, etc.

SEVENTY-FIVE architects have sent in plans for the proposed Church of the Sacred Heart at Montmartre. They have just selected six of their number to form part of the jury which is to award the prizes, consisting of sums of 12,000, 8,000, and 5,000 francs, and seven sums of 1,500 francs each. All the plans sent in are to be exhibited shortly in one of the wings of the Palace of Industry.

THE *Chronique* records that a rich merchant of Madrid, M. Bosch, has established for the benefit of Spanish artists, who at present enjoy few advantages of the kind, a permanent exhibition of works of art. The new gallery has been opened with great éclat, and many artists have already lent some of their finest works. M. Carlos de Haës, who is described as "l'un des plus grands paysagistes de notre temps," has sent four admirable pictures. There are some water-colour, and three oil paintings by M. Fortuny, and "une petite merveille," signed "Domingo" and entitled *Les Saltimbanques*. Among the less known but rising painters, the same note mentions the names of MM. Augustin Lhardy, Sala, and Garrido, the latter little more than a child.

WE learn from the *Builder*, that the first of the series of statues of distinguished statesmen, which it is proposed to place in Parliament Square, opposite Palace Yard, is now nearly completed. It is a full-sized bronze statue of the late Lord Derby, and is the work of Mr. Noble. The site is in the centre of the southern garden, and the pedestal is of red Aberdeen granite, polished and adorned with a chain of oak leaves and acorns in bronze. On the sides bas-reliefs will be placed representing the statesman in the House of Commons, at a Cabinet Council, during his installation as Chancellor of the University of Oxford, and in some scene typical of his exertions during the cotton famine. A similar statue to Lord Palmerston is in progress, and will be erected in the centre of the ground facing Palace Yard.

ONCE more there is talk of a statue to Cromwell, this time in Manchester. It is offered as a gift to the town by a lady of whom all we know is derived from the statement of the town clerk that she is "very dear to Mr. Alderman Heyward." Possibly it is Mrs. Alderman Heyward. The application for a site came from Mr. Noble, to whom the execution of the statue has been entrusted. The discussion will revive in many minds the "divine scorn" of Thomas Carlyle's *Latter-day Pamphlets* on Hudson's statue:—

"Shall Cromwell have a statue? Side by side with

a sacred Charles the Second, sacred George the Fourth, and the other sacred Charleses, Jameses, Georges, and Defenders of the Faith, I am afraid he wouldn't like it! Let us decide provisionally, No."

In Manchester the great Protector is to have an open-air site to himself, so that the sarcasm loses something of its point.

THE Paris *Journal Officiel* has announced that a portrait, by Nattier, of Mme. Adelaide, daughter of Louis XV., is about to be placed in one of the galleries of the French School. Before September 4 this portrait was hanging in the palace of St. Cloud.

LOUIS AUGUSTIN MULLERET, who died a short time ago in Paris, at the age of seventy, was one of the few modern artists in metal whose works can be compared with those of the Renaissance period. He was employed for six years in England, by the well-known firm of Hunt and Roskell, but returned to Paris in 1854, and entered the manufactory at Sèvres, where he continued until 1872. To the end of his life he remained devoted to his favourite art, and even in his last agony his son saw his hand working as though with a chisel and mallet.

FROM the Fourth Report of the Deputy-Master of the Mint, which has just been issued, we learn that the arrangement of the coins and medals belonging to the Mint, including those presented by Sir Joseph and Lady Banks, has been completed, and a descriptive catalogue has been compiled by Mr. William Webster. The whole collection is now open to the inspection of the public in the museum attached to the Die Department, and is interesting as illustrative of the successive changes in design and execution which the British coinage has undergone from the time of the Saxon Kings to the present day. Among the coins of special interest in the collection may be mentioned a shilling of Henry VII., which marks an important change in the design of the British coinage, namely, the substitution of the royal shield of arms for the cross with "pellets" at the angles, which had up to that time formed the reverse of the coins, and illustrates the great advance in art made during this reign. Other coins of great numismatic interest are the "Oxford crown," the work of Thomas Rawlins, chief engraver of the Mint during the Civil War, which is one of a series of coins and medals by the same artist struck at Oxford before its surrender by the Royalist force in 1646; and the celebrated "petition crown" by Thomas Simon, who was chief engraver of the Mint under the Commonwealth, and whose petition to be retained in that office at the Restoration occupies the rim of the coin.

Steps have been also taken for the examination of the records of the Mint, under the direction of the Deputy Keeper of the Public Records. These relate to a period of more than two centuries, and still remain in the custody of this department. The examination applies to all documents of a date anterior to 1850, and is made with a view to the preservation of such books and papers as are of interest, and the destruction of such as are now valueless.

Mr. Fremantle concludes his report with a reference to the question of the reconstruction of the Mint buildings and the renewal of the machinery, a matter which has been under consideration since the year 1870 and is still undecided. It seems imperatively necessary that a remedy should be provided, the condition of the department being a source of serious disadvantage to this branch of the public service.

THE French Government have taken the laudable resolution of rescuing from further destruction all so-called Druidical monuments by declaring that monolithic and similar remains are to be considered as the property of the State, and under its protection. This measure has special reference to the department of Morbihan, in Brittany, where the peasants have for ages been in the habit of

using the monoliths of Carnac and Auray for building and other purposes, until the number has been reduced to a few hundreds, although, according to the statement of Canon Moreau, who wrote in the sixteenth century, there were in his time between 13,000 and 15,000 menhirs still remaining. The principal monument at Carnac is the property of private individuals, but by the intervention of the Government it will be so far appropriated by the State as to be placed officially under the charge of the commune in which it is situated, and which will be held responsible to Government for the preservation of the ruins. The Carnac monument consists of ten avenues formed by eleven rows of menhirs, and all leading towards the central cromlech, which is raised on the top of a hill about 1,500 metres distant from the entrance to the avenues.

THE STAGE.

MONSIEUR SARDOU'S LAST COMEDY.

L'Oncle Sam, the so-called comedy of American life and manners, which has been acted during this week at the Queen's Theatre, by the accomplished players of the Paris Vaudeville, is one of the poorest works that ever proceeded from the pen of a clever and generally laborious man. It is a farce in five acts: relieved and for the moment made interesting by one dramatic situation. They say that nothing is so easy to write as a book of travels about some land unknown to the civilised world. The unknown is always wonderful; and the man who penetrates, or tells you he has penetrated, to, say, a region of Central Asia, makes all his statements and all his representations under the comforting sense that there are few who will be able to contradict him. And this is the flattering unction which Monsieur Sardou must have laid to himself when writing for his fellow-countrymen about the society of New York. His reckoning was probably imprudent. There are enough travelled Parisians to set him and his neighbours right. Even the French will not believe that in New York society divorce is so common that it is no unusual thing for a woman to introduce, with great *sang-froid*, her second husband to her first. They will not believe that an American girl will go away to Saratoga for a day or two with a young Frenchman who happens to admire her, nor will they believe that New York men of business may with impunity sell people irreclaimable marshes at the price of real estate. And even if they believed all this—not one word of which can they believe, despite the common Parisian credulity—they would still demand that a comedy should contain something to laugh at; and that a dramatic work which it takes three hours to act should contain more than one dramatic situation—more than one moment of serious interest. M. Sardou's latest comedy is a thing of the wildest improbability, unrelieved by wit. It is admirably acted; and it showed to the Parisians "some new thing," and so they went to see it at the Vaudeville; but the play itself was condemned wherever common sense remained. It is part of M. Sardou's diligent attempt to build his fortune and undermine his fame. No other writer of equal repute would have given his *imprimatur* to this piece. The younger Dumas has sickened us with physiological studies; but he was interested in them himself. He has done nothing that has not cost him serious labour; and if his treatment of social questions is open to reproach, it is so chiefly on the very ground of its gravity. He has invented a philosophy—dark to the rest of us—and has pursued it at the expense of an effect that should be purely artistic. But a wild farce, cut up into five acts, he has not yet misnamed a comedy. Nor would M. Emile Augier—a graceful poet: an analytical student—have done this thing. He knows humanity better than stage tradition, and could not sacrifice truth to character for the sake of a telling exit.

The one dramatic situation which M. Sardou has contrived in *L'Oncle Sam*, is that in which the very fast American heroine is placed, when having been to Saratoga, or whatever other watering-place it may be, with the young Frenchman who admires her, she finds herself suddenly struck with love of him—love for the first time in a feverish life, and love just at the moment when she sees he can no longer respect her. Here is a strong short scene of passionate shame and self-condemnation, acted by Mlle. Massin with vigour and emotion and seeming impulse, and then the thing is done. The redemption of a woman through a sincere love—that has long indeed been recognised as a fine and fitting theme for dramatic treatment: it is treated incidentally in *Les Idées de Madame Aubray*: it is treated by Balzac in *Splendeurs et Misères* with a profounder knowledge and more consummate art. The theme is too great for Monsieur Sardou. He sees its stage-effectiveness, and not its human interest. And so he touches it, and goes contentedly away, to his river-steamboat medley of society—to his trade adventurers, his scheming widows, his sensuous theologians, and his spiritual wives.

Mlle. Massin acts the fast heroine with grace and with a suitable coolness. For until the journey to Saratoga or elsewhere, Miss Sarah, though audacious, is an unstirred person who does for herself in New York, with undeniable shrewdness, what decorous mothers in our Mayfair are no doubt falsely suspected of doing for their offspring. Is it a question of marriage? She will make excellent terms. But the whole thing is unreal. No good acting can make it real, and Mlle. Massin's acting is good throughout—better, much, than four or five years ago, when she was at the Gymnase—and, at the one dramatic moment, really fine and impressive. M. Train's part—that of the young French lover—though not an excellent one, is perhaps the best the piece can show. One or two good sentences, of which the sentiment must have been applauded very heartily on the Boulevards—sentences which recall the quiet virtues of the French country side, amidst the noisy hotel come-and-go of the Fifth Avenue—are spoken by him with feeling and good effect. M. Parade, who plays *L'Oncle Sam*—Sarah's uncle, busy with speculation, indifferent to her fate—is always M. Parade and nobody beside, though M. Parade's nationality is sometimes American, as in *L'Oncle Sam*, and sometimes French, as in *Nos Intimes*, and sometimes Dutch, as in *Les Pattes de Mouche*. His temperament is always the same: heavy-eyed, stolid, phlegmatic; slow of movement and thick of utterance—in every part he plays he is incarnate dullness, with a wearisome persistency, and the artistic effect which he produces, though genuine at first, and even too distinctly individual and his own, becomes, with familiarity, repugnant. M. St. Germain, an actor of not undeserved distinction, does his utmost, and it is much, for the not very intelligible character of Gyp: a character which we spare ourselves the burden of discussing.

And Mme. Fargueil? The stage-experience of a quarter of a century leaves her in undiminished possession of vigour, brightness, and alacrity, and M. Sardou, in mercy to her and to the public, has given her a character which has nothing of improbable. She is an everyday Frenchwoman, settled in America, and so far mistress of her wits that she can not only fight her own battle against the speculators, who sell her valuable marshes, but can at a given crisis become the advocate of her young fellow-countryman when Sarah's mercenary relatives are asking of him damages for the scandal of which Sarah is the ultimate cause. The character, though natural enough in life, is not provided with sufficient motive on the stage. She has little to do and very much to say. It is pleasant to find Mme. Fargueil have very much to say, but it would not be wholly a loss if what she said were somewhat to the point. In place of this she talks, with

witty shrugs, of social questions; explains America, à la Victorien Sardou, to her young travelling friend; and irritatingly reminds us of how well she could do something, had she but something to do. Such charm as the character has, as seen at the Queen's Theatre, is due to Madame Fargueil's personality; but she cannot give it quite the charm after all which she gave to a very similar character in *Pattes de Mouche*—a piece in which there was really something to bustle about: some excuse, though only an airy one, for that crispness and alertness of gesture which are so peculiarly Madame Fargueil's own. Still even here, where there is so little to do, notice how sure she is of every effect. The slightest movement tells what it is meant to tell—a lifting of the eyelid, a fugitive smile—how little and how much. Here is a theatrical artist who knows not only the value of movement, but the value of silence. Without youth, without notable beauty, here is social charm, social ease. It is not an actress who parades the stage, but a witty woman of the world, who knows everything before you can tell her—surmises everything before you can hint—and whose presence pervades the place like an aroma, or the sense of colour. She brightens the society in which she moves. This charm, in its essence not of the stage, is possessed by only two or three among English theatrical artists—most of all perhaps by Charles Mathews, if we remember that a man must “wear his rue with a difference.” With Charles Mathews, it is the greater part of his genius—a genius which in one's new praise of new powers like Mr. Irving's, must not be forgotten because he has had it for forty years, instead of for four. Acting like Madame Fargueil's—charged, I know well, with certain mannerisms to be discovered only when one is familiar with her art—is, in its subtle and delicate expressiveness, in its finesse, its continuity and its apparent ease, the best lesson of which young English actors can avail themselves, if they wish to be artists, and English playgoers, if they wish to be judges. **FREDERICK WEDMORE.**

THERE have been changes of programme at two West-End theatres, though the changes have brought nothing quite new. The Vaudeville now gives Mr. Gilbert's little after-piece, *Creatures of Impulse*, at the end of the evening, after the telling comedy. An actress new to the theatre—and known as Miss Amalia—appears in the piece, and so does Mr. Righton, whose engagement continues. At the Strand there have been two revivals. *Paul Pry*—the famous old last century comedy in which the American Mr. Clarke was successful two or three years ago—has been reproduced with that clever young actor, Mr. Edward Terry, in the principal part; and the old comedy, which, truth to say, is not, from a literary point of view, the most favourable of its class, is followed by a burlesque which as an after-dinner entertainment is not at all to be despised.

THE Standard Theatre is occupied for the moment by Mr. Craven Robertson's company—organised for the performance, in the provinces, of Mr. T. W. Robertson's little comedies. For the purpose which it sets before itself, the company is sufficiently capable. This week *Caste* has been given at the Standard. Last week it was *School*.

THE Times has published, and we also, with other journals, have received a letter from the manager of the French plays at the Princess's, in which Messrs. Valnay and Pitron invite subscriptions to enable them to continue an enterprise which they have thus far conducted with a good deal of spirit and with unceasing pains and care. They offer, in return for the subscriptions which they solicit, tickets for the performances which they propose to give during this and the next season; and they are probably not wrong in believing that the number of obstacles that have been occasioned them through the treatment of the licensing authorities will secure for them some

substantial proofs of sympathy. They willingly engage to acknowledge, either directly or in the public prints, any contributions which they may receive. A very large number of French families in London are now dependent for their support upon the continuance of the French plays in this capital.

MDME. FAVART has given one representation at the theatre at Vichy, where Mdme. Fargueil and Mdle. Croizette are also engaged for flying visits.

THOSE Paris newspapers that are wont to devote two or three columns every day to the minor gossip of the theatres, are very hard up for the material for their work. The gentleman who goes about from play-house to play-house every evening, bringing back to *Figaro* the all-important news of Mdle. Blanche Pierson's last gown, and of who talked with Sarah Bernhardt in her box on an opening night, appears to be suddenly unequal to the great occasion. He has disappeared from the columns of M. de Villemessant's journal.

RETURNING to the discussion of Jules Janin as a critic, M. Francisque Sarcey—who is probably out of town, and finds it convenient to discuss something that he has not got to go to the theatre to see—recapitulating in *Le Temps* what he said last week about Janin's reputation being due to the discovery of a new manner, further avers that the manner consisted in always treating himself as superior to the thing or person to be criticised. And in support of this statement, M. Sarcey quotes a confession of Janin's faith, made many years ago in his long-talked-of *feuilleton*:—

“Il faut bien se persuader,” says Jules Janin, “que les gens qui vous lisent, n'ouvrent pas un journal dans le but de savoir si le comédien a été sublime. . . . Je vous le répète, car je vous l'ai déjà dit, vous tous qui exercez l'art de la critique, il faut d'abord songer à vous: après quoi vous songerez au poète, au musicien, au décorateur, au machiniste: il faut avant tout que le lecteur vous honore et vous estime: qu'il s'inquiète avant tout de vous-même, après quoi il s'inquiètera, s'il a le temps, de toutes ces choses futiles, éphémères, inertes, qui ne sont que le prétexte de vos discours.”

This speciality in Janin's work—for he was one of the few men who not only make theories, but act upon them—has perhaps too much escaped his English eulogists. There has been innocently quoted a criticism on Rachel, which reads as a pleasant narration made the day after her performance. It is nothing of the kind. When, five and twenty years ago, Janin saw Rachel in *Adrienne Lecouvreur*, no doubt he wrote about something else—it was only when the Paris public was seeing Favart, a little time ago, that he took to writing about Rachel. It was consistency on his part. He enjoyed writing. The subject did not matter—or rather it must be known, only in order that it might be avoided. To write an article three columns long was almost the easiest thing in the world to him. Perhaps it might have been better for his fame if he had recollected that there was one thing easier still—not to write it.

THE French classical drama has been played during the week, at the Saint James's Theatre, by Mdle. Agar and a company selected to support her. Mdle. Agar was for some years the leading actress of the Odéon, which theatre she left about the time of the war, and was engaged for a brief period at the Théâtre Français. The pieces in which she usually appears—those known in France as belonging to *le grand répertoire*—are not such as can commend themselves to English audiences of the present time. In Paris, too, they are more talked about than genuinely cared for. To modern playgoers Corneille has nothing to say, and Gérôme knew this very well when for this year's Salon he painted a picture of the French tragic writer reading to the young Molière a new manuscript drama. Evidently Molière was in advance of his age—he has the air of finding Corneille's piece uncommonly dull to listen to. If it can ever be otherwise than dull, stilted, and unnatural—save indeed in the hands of the genius of

Rachel—Mdle. Agar would make it so. She is, in her own way, and Corneille's way, an accomplished artist, gifted to begin with with a commanding figure and a rich, powerful, and flexible voice; and she has improved these gifts by years of practice, guided by a certain sense of grace and dignity. Her delivery is very varied, and so she manages to break the monotony of the long speeches—an art which she possesses, of course, in common with all those who inherit the traditions of the Français and the Odéon—and her attitudes are all elaborately studied; her draperies are statuesque. It would perhaps be too much to say that she can make *Horace* deeply interesting; at all events she can make it endurable. Like classic statues, she and all her fellow-actors are more expressive by the figure than the face. They do not so much endeavour to represent individuals, as to give emotions bodily form. They are not *Horace*, *Camille*, *Sabine*; but valour, rage, despair, resignation. Or rather, this is what they try to be—this is what Rachel succeeded in being; but, take her for all in all, she has had no successor. And until some terrible genius like Rachel shall arise, French classic tragedy will not live again. When such a genius does arise, she will probably pass it and its puppets by, for some new work with which modern humanity has to do. At the St. James's Theatre the audiences have been scanty. Yet Mdle. Agar's performance is, by reason of her grace and her perfect enunciation and perfect emphasis, a profitable lesson. One can understand that Pall Mall should stop away from any performance at the neighbouring playhouse which doesn't happen to be a *cancon*; but where were the school-girls for whom Corneille is proper? Where was Harley Street, and where Bedford Square?

MUSIC.

CRYSTAL PALACE.

A CONCERT consisting entirely of Russian and Polish music, be its merits great or small, can at least lay claim to attractiveness on the score of novelty. How little we really know of Russian composers will be sufficiently seen from the enumeration of the names of those who were represented at the sixth summer concert at the Crystal Palace last Saturday. Specimens were given from the works of Glinka, Warlamow, Tarnofsky, Chopin, Bortniansky, Klimofsky, Tchaikofsky, Leschetizky, Rubinstein, Lasariew, Dargomijsky, and Zarzycki—as interesting a series of exercises in pronunciation as has ever been brought together in a programme in this country. All these names, if we except Chopin and Rubinstein, are little more than names even to musicians in England, and on this account the concert demands a somewhat more detailed notice than has been given to the summer concerts which have preceded it. A programme containing a round dozen of absolute novelties is indeed a rarity; and the great variety of its contents increases the difficulty of adequately estimating it.

The musician to whom, and with justice, most prominence was given was Glinka—perhaps, on the whole, the most distinguished composer Russia has as yet produced. He was born in 1804 and died in 1857 (not 1837, as given by a misprint in the programme.) His best-known work on the Continent is the opera *Life for the Czar*, which still keeps the stage in Germany. From this work two movements were given on Saturday—a polonaise and chorus, sung by the Crystal Palace choir, and a recitative and air, given by Madame Smida. The former is a showy and lively piece, brilliantly though somewhat coarsely scored, which it was evident lost in its effect apart from the stage. The song did not particularly impress us. Madame Smida has a fine and rich contralto voice, in her use of which, however, the *tremolo*—that bane of so many vocalists—was unpleasantly prominent. The overture to Glinka's opera *Rouslane and Lydmila* shows decided originality,

and its themes are pleasing as well as new. The orchestration, however, is in places harsh, from the preponderance of brass instruments. By far the best specimen of Glinka's music presented was the fantasia on Russian airs, entitled "*Kamarinskaja*," which is from first to last most fresh and enjoyable. The scoring, also, is extremely piquant, and far more discreet and tasteful than in the overture just named.

To the selection from Glinka succeeded two part-songs, sung by the "Eight Russian Lady Vocalists." It is unpleasant to have to say it, but the truth must be told—we were greatly disappointed with them. Had they simply come forward on their own merits, it would probably have been otherwise; but after the highly laudatory advertisements and critiques which have appeared in the papers (though one knows the value of puffs in general), we were led to expect something remarkable, and as a matter of fact did not find it. They are simply eight ladies with very respectable voices, and who sing well together, and are dressed alike—and that is all. They are probably in no way responsible themselves for the way in which they have been advertised; but whether they are or not, the whole system of the "puff preliminary" is a rotten one, deserving censure, and which is sure sooner or later to injure those who have recourse to it. The two part-songs, one by Warlamow, and the other a popular Russian melody, presented no remarkable features. Signor de Reschi, a Russian singer with a very agreeable tenor voice, next sang a rather commonplace melody by Tarnofsky, after which M^{me}. Essipoff played in her most magnificent style the Romance and Rondo from Chopin's concerto in E minor. It was with this concerto that the lady (as previously recorded in the *ACADEMY*) made her first appearance in this country. We have on more than one occasion expressed our opinion of her very remarkable talent, and need therefore only say now that she has probably never been heard to greater advantage than last Saturday. The orchestral accompaniments were given by the Crystal Palace band with great finish—Mr. Manns resigning his baton for the occasion to the pianist's husband, Herr Leschetizky. Bortniansky's "*Sanctus*," capitolly sung without accompaniment by the Crystal Palace choir, is better known in this country than most of the pieces in the programme, being published in at least three different editions in England. Madame Smida then gave a not very striking Russian romance by Klimofsky, which was followed by a group of three short but very interesting pianoforte solos by Madame Essipoff. These were a "*Romance Russe*," by Tchaikofsky, an impromptu "*Les Alouettes*," by Leschetizky, and Rubinstein's charming valse in A flat. After the Russian lady vocalists had sung another part-song, by Lasariew, one of the most curious pieces of the programme was performed. This was an orchestral fantasia entitled "*Cosatschoque*" (Cossack dance), by Dargomijsky. It is so exceedingly novel and peculiar that it is impossible to pronounce an opinion upon it after a single hearing, and without having had an opportunity of seeing the music. It may at least be said that it is both brilliant and strikingly original. The last song in the programme, "*Szedlem gajem samotny i cichy*" (whatever that may mean), by Zarzycki, sung with great taste by Signor de Reschi, pleased us more than any other vocal piece of the concert. It is a plaintive and charming melody, which from the style we should imagine to be a love-song. By the composer's name, and the general look of the words which were given in the programme, very little to the enlightenment of the bulk of the audience, we should guess that the song is Polish, rather than Russian. The general tone of the music, also, bears a certain resemblance to that of Chopin. The concert concluded with Rubinstein's "*Ouverture Triomphale*," Op. 43, an interesting but, like most of its author's larger compositions, unequal work.

To-day the programme consists of Scandinavian music, and it will probably be at least as interesting as that of last Saturday.

EBENEZER PROUT.

LONDON is to be the third town in which Verdi's new *Requiem* is to be heard. Mr. Gye, we understand, will produce the work at Covent Garden at the close of the season, with M^{me}. Vilda, M^{lle}. d'Angeri, and Signor Marini as soloists.

THE programme of the "Mozart Festival," which M^{me}. Patti, as mentioned in our notes last week, announces for Thursday next, is to include, among other pieces, parts of one of the great composer's sonatas for piano and violin, and one of his piano quartetts, in both of which M^{lle}. Krebs and our excellent violinist, Mr. Carrodus, will perform. A special feature will also be the great finale to *Don Giovanni*, in which all the principal singers of the Covent Garden company, including M^{me}. Patti herself, will take part in the chorus.

MESSRS. STANLEY LUCAS, WEBER, AND Co., the music publishers, have lately conceived the excellent idea of following the example of some of the German houses, and issuing a monthly catalogue of novelties in music and musical literature. Two or three numbers have already been forwarded to us; and the publication is one which is likely to prove most useful to all who desire to keep themselves informed of the progress of the art.

THE first volume of Mr. William Chappell's *History of Music* has just been published. It embraces the portion of the subject "from the earliest records to the fall of the Roman Empire; with explanations of ancient systems of music, musical instruments, and of the true physiological basis for the science of music, whether ancient or modern."

M. SAINT-SAENS, the eminent French musician, has composed a grand opera in four acts on the subject of *Samson*. The work contains three principal parts, Samson (baritone), a Philistine priest (tenor), and Dalila, which last rôle requires a contralto of the first rank. Fragments of the opera were lately performed at the house of M^{me}. Viardot.

M^{me}. OTTO-ALVSLEBEN has left London, and returned to Dresden. She is expected to revisit this country in October, and is, we understand, engaged for the Leeds festival.

AT a concert lately given at Niort, in France, a curious experiment was tried: two clarinet concertos being performed with the solo parts played by five clarinets in unison!

SIGNOR DELLE SEDIE, the distinguished singer, is about to print a book entitled *L'Arte lirica, trattato del canto e dell'espressione*.

HERR M. BLUMNER has completed a new oratorio, *The Fall of Jerusalem*. The work will be published by Messrs. Bote and Bock, and is to be performed next winter by the Singakademie in Berlin.

THE Summer Theatre at Cologne was entirely destroyed by fire on the night of the 22nd ult.

ANTON RUBINSTEIN's opera *The Demon* is to be produced next winter at the Russian Opera House in St. Petersburg.

THE poet Vincenz Zusner, who recently died at Gratz, has made provision by his will that every year two prizes of twenty and ten ducats respectively are to be offered for the best compositions of two songs from his poetical works. The three judges, each of whom is to receive five ducats yearly, are to be chosen from the Conservatoire at Vienna.

THE death of Herr Paul Mendelssohn Bartholdy

—at Berlin on June 21, after a very protracted and painful illness—demands a word of notice; not only because he was the last survivor of the family of four, of whom Felix Mendelssohn was so illustrious a member, but also for his own sake. He was born in 1812, and was therefore three years the junior of his great brother. Through life nothing occurred to interrupt their perfect friendship; and after Felix's death, if Herr Paul's interpretation of his brother's wishes led him, rightly or wrongly, to oppose the publication of his musical remains, we have at least to thank him for the two volumes of letters which he edited, and which, in their way, form a collection of Symphonies, Overtures, Quartetts, and Lieder ohne Worte, as characteristic of their author as his music itself. Herr Paul was always a lover of music, and his quartett parties were renowned in Berlin. In earlier life he played the violoncello; more than one of his brother's pieces was written for him, and it is hardly an idle fancy to trace the prominence which the cello occupies in Mendelssohn's orchestral scores to an early affection for his brother's instrument. He inherited the splendid collection of Beethoven autographs which Felix had formed, and the writer can testify to the liberal and unsuspicious way in which he allowed these priceless treasures to be examined and extracted. He presented them very shortly before his death to the Imperial Library of Berlin. He had also at one time the MS. sketch of Schubert's Seventh Symphony (in E), but this he very generously gave to Mr. Grove, late of the Crystal Palace, in whose possession, we believe, it still remains. His taste in pictures was very good, and his home contained some very fine specimens by living painters.

Painful as his illness was, he remained conscious to the end; and one of his last acts, after taking leave of his family, was to be carried to his garden, which he had made out of the desert-sand of Berlin, and to which he was fondly attached, that he might take a last farewell of that also.

LITERATURE.

The Dramatic Works of Thomas Heywood.
In Six Volumes. (London: John Pearson, York Street, Covent Garden, 1874.)
(First Notice.)

"IF I were to be consulted as to a reprint of our old English dramatists," says Charles Lamb, "I should advise to begin with the collected plays of Heywood. He was a fellow actor and fellow dramatist with Shakspeare. He possessed not the imagination of the latter, but in all those qualities which gained for Shakspeare the attribute of gentle, he was not inferior to him—generosity, courtesy, temperance in the depths of passion; sweetness, in a word, and gentleness; Christianity, and true hearty Anglicism of feelings, shaping that Christianity, shine throughout his beautiful writings in a manner more conspicuous than in those of Shakspeare; but only more conspicuous, inasmuch as in Heywood these qualities are primary, in the other subordinate to poetry." In another note Lamb calls Heywood a "prose Shakspeare." Allowing for the exaggeration with which an enthusiastic love for our then neglected minor dramatists charged all the criticism of Charles Lamb, this verdict is in many points a just one. Heywood, while he lacks the poetry, philosophy, lyric sweetness, variety, and consummate art of Shakspeare—those qualities, in a word, which render Shakspeare supreme among dramatic poets—has a truth to nature, a tenderness of pathos, and an instinctive perception of nobility, that distinguish him among the playwrights of the seventeenth century. Like Dekker, he wins our confidence and love. We keep a place in our affection for his favourite characters; they speak to us across two centuries with the voices of friends; while the far more brilliant masterpieces of many contemporary dramatists stir only our æsthetic admiration.

The wish expressed by Lamb that Heywood's plays should be reprinted was nearly carried out by the Shakspeare Society, who in 1842-1846 published four dramas by this author, under the editorship of Mr. Barron Field. After his death, in 1847, Mr. J. P. Collier continued the work, and during the years 1850 and 1851 produced another eight. Here the republication of Heywood ceased, as far as the Shakspeare Society were concerned. But Dilke had included three plays in his collection; two were well known in Dodsley; *Love's Mistress* and the *Rape of Lucrece* had appeared in Baldwyn's *Old English Drama*; Mr. Halliwell, in 1853, had printed the *Lancashire Witches* in a separate quarto. Still a complete issue in one series of the twenty-three plays written by Thomas Heywood, and committed to the press in the first half of the seventeenth century, remained a desideratum until Mr. Pearson's present publication.

This edition includes the whole of the plays which had been previously reprinted, with the addition of the two parts of *The Iron Age*, *A Maidenhead well Lost*, *The Wise Woman of Hogsdon*, and a set of short dramatic scenes entitled *Pleasant Dialogues and Dramas*, which were not catalogued by Mr. Halliwell, but which are valuable for the additional light they throw on Heywood's management of classical material. At the same time five of Heywood's masques have been added to the collection, only two of those mentioned by Halliwell, *London's Fountain of Arts and Sciences*, and *The London Imp*, being noticeable by their absence, while their place is supplied by the *Sinus Salutis* and *Porta Pietatis*, not catalogued by Halliwell. The omission of these two masques, and the unmethodical arrangement of the whole series of plays, are the only important defects to which attention need be called in these six welcome volumes.

Heywood, unlike many of his contemporaries, and in this respect notably unlike Dekker, seems to have kept tolerably free from joint composition. Of the twenty-three plays before us, only two, *The Late Lancashire Witches* and *Fortune by Land and Sea*, were produced by him in collaboration, the former with Brome, and the latter with W. Rowley. Of all the playwrights of that period he was the most prolific. In 1633 he owned to having "had either an entire hand or at least a main finger" in 220 dramas; and after that date others were printed, which may perhaps be reckoned in augmentation of this number. His literary fertility is proved by his *Nine Books of Various History concerning Women*, a folio of 466 pages, which appeared in 1624 with this memorandum: "Opus excogitatum inchoatum, explicitum, et typographo excusum inter septemdecem septimanas." Kirkman, the bookseller, in his advertisement to the reader at the end of the second edition of his catalogue of plays, observes of Heywood that "he was very laborious; for he not only acted almost every day, but also obliged himself to write a sheet every day for several years together." In fact, he appears to have been an Anthony Trollope of the seventeenth century. Besides composing dramas, he delighted in the labour of compilation, and had for some time on hand a *Biographical Dictionary* of all the poets, from the most remote period of the world's history down to his own time. The loss of his MS. collections for this book is greatly to be regretted, since there was no man of that century better qualified by geniality and honesty of purpose for the task than the old playwright, who put into the lips of Apuleius:—

"Not only whatsoever's mine,
But all true poets' raptures are divine."

Even as it is, the few lines in Heywood's *Hierarchy of Angels* on the nicknames of the poets of his day are among the raciest scraps of information which we possess about those dramatists. The miscellaneous nature of Heywood's literary labours justifies us in classing him, together with Robert Greene, among the earliest professional *littérateurs* of our language. His criticism is often quite as valuable as his dramatic poetry. The whole of

the running dialogue between Apuleius and Midas in *Love's Mistress*, for example, contains a theory of the relation between poets and the public, while the prologues to *A Challenge for Beauty* and *The Royal King and Loyal Subject* are interesting as showing to what extent the dramatists of the Elizabethan age pursued their art with conscious purpose and comparison.

It is curious to notice how careless, in common with many of his contemporaries, Heywood was about the fate of his dramatic writings. Plays, and comedies in particular, were written, not to be read and studied, but to be acted. This we should never forget in passing judgment upon the unequal work of the Elizabethan playwrights. In the Address to the Reader prefixed to the *English Traveller* Heywood complains that this tragedy had been published without his consent, and apologises for coming forward to father it before the world, adding, not without a sly poke at Jonson and his school:—

"True it is that my plays are not exposed unto the world in volumes, to bear the title of works (as others); one reason is, that many of them by shifting and change of companies had been negligently lost; others of them are still retained in the hands of some actors, who think it against their peculiar profit to have them come in print; and a third that it never was any great ambition in me to be in this kind voluminously read."

In the preface to the *Rape of Lucrece* he repeats his complaint against the clandestine and unauthorised publication of his plays, with this declaration of his own habit of dealing with them:—

"It hath been no custom in me of all other men (courteous readers) to commit my plays to the press; the reason, though some may attribute to my own insufficiency, I had rather subscribe, in that, to their severe censure, than, by seeking to avoid the imputation of weakness, to incur greater suspicion of honesty; for though some have used a double sale of their labours, first to the stage, and after to the press; for my own part I here proclaim myself ever faithful to the first, and never guilty of the last."

He then proceeds to show that the pirated editions of his plays in mangled copies have forced him to right himself before the public by superintending the issue of a certain number of his works. In the prologue to *If you Know not Me, you Know Nobody*, the same apology is reiterated in terms which throw a curious light upon the short-hand reporters of plays for the press, employed by piratical booksellers to the prejudice of authors and theatre managers:—

"Some by stenography drew
The plot; put it in print (scarce one word true);
And in that lameness it hath limped so long,
The author now to vindicate that wrong
Hath took the pains, upright upon its feet
To teach it walk, so please you sit, and see 't."

Of the twenty-three plays in Mr. Pearson's collection, four—namely, the two parts of *Edward IV.* and the two parts of *If you Know not Me, you Know Nobody*—are histories of the old-fashioned sort, rudely dramatised from English chronicles, and seasoned with comic and pathetic episodes. Of the two series, *Edward IV.* has in it more of Heywood's special quality; the interlude of the Tanner of Tamworth and the romance of Mistress Shore displaying his double power of dealing with drollery and passion in the simplest and most natural style. *If you*

Know not Me, you Know Nobody is a history of the reign of Queen Elizabeth, including her early dangers and the late glories of the defeat of the Armada. The whole series of scenes breathes the strongest English patriotism and the most enthusiastic Protestant feeling. It is a pity that, hastily and clumsily pieced together, a drama so interesting in its matters should almost be almost valueless as a work of art. It was published as a companion to S. Rowley's *When you See Me, you Know Me*, which has recently been reprinted by Dr. Karl Elze. The *Lancashire Witches* and the *Wise Woman of Hogsdon* are comedies of English life, without that element of romantic interest which Heywood usually added to the domestic drama. The plot of the latter play turns upon the quackeries and impostures of a professed fortune-teller; but to mention it in the same breath with Jonson's *Alchemist* would be ridiculous. The *Lancashire Witches*, though it attempts, in one scene at least, to touch the deeper interest of witchcraft, deals for the most part only with the vulgar and farcical aspects of the subject. It has nothing in common with *The Witch of Edmonton* or Middleton's *Witch*. A household turned topsy-turvy, a coursing-match spoiled, a farm-servant changed into a gelding, and a bridegroom bewitched with a charmed codpiece-point upon his wedding night, are among its insipid drolleries. In *Fortune by Land and Sea*, *The English Traveller*, *The Fair Maid of the Exchange*, and both parts of *The Fair Maid of the West*, Heywood displays to better advantage his predilection for homespun stories, dealing chiefly with the incidents of country life and the adventures of English captains on the high seas. Pure comedy and pure tragedy were neither of them suited to his genius. He required a subject in which the familiar events of English domestic life might be contrasted with the romantic episodes of sea roving and of foreign travel. To interweave these motives with the addition of pathos and sentiment, was just what he could do successfully. No dramatist has painted more faithful home pictures. None have thrown more natural light upon the pursuits of English gentlemen in the first half of the seventeenth century. The merit of all these five plays is considerable. It would have been impossible even for Fletcher to realise a difficult scene with greater ease and delicacy than are displayed in the interview between young Geraldine and Wincott's wife, in the *English Traveller*. A pair of lovers, who have been parted, meet again and renew their old vows in the bedroom of the girl just made a wife. The calm strength and honourable feeling displayed by this Paolo and his Francesca in their perilous interview are the result of unsuspecting innocence and sweetness. If the situation is almost unnatural and disagreeable, the poet has contrived to invest it with the air of purity, reality, sincerity, and health. *Fortune by Land and Sea* is richer in scenes which reveal Heywood at his best. The opening of this play is one of his most vigorous transcripts from contemporary English country life. Frank Forrest, a daring and highblooded youngster, evades his careful father, and flies off to a neighbouring tavern,

less for the sake of drinking than in order to meet spirited companions. One of them picks a quarrel with him about his respect for his old father, and the boy is killed. The grief of old Forrest, the challenge given by the brother to Frank's murderer, the duel that ensues, and young Forrest's escape, are all set forth with photographic reality and force. Event huddles upon event, and the whole proceeds with the simplicity of truth. These scenes only form a prelude to the play, which, like most of Heywood's, contains a double plot; but at the same time they are its salt. The *Fair Maid of the West*, a romantic drama in two parts, consists of the adventures of the Devonshire Captain Spencer and his love Bess Bridges, who is introduced to us as the mistress of a Plymouth inn. It may be said in passing, that few tavern-scenes in our Elizabethan drama, not even those of Dekker, are better painted than those which form the introduction to Act I. Battles with pirates, slavery in Fez, and adventures in Florence form the staple of the drama, which must have presented many attractions to an English audience of the age of Stukeley, Sherley, and Drake. The *Fair Maid of the Exchange* is another play belonging to what the Germans style *das bürgerliche Drama*. To my mind its sentiment is sickly, and its story, in spite of many beautiful passages, disagreeable. Phillis is the *Fair Maid*; and the real hero of the piece is a cripple, who saves her from a ruffianly assault, and who falls in love with her. She returns his love; but Heywood had not the courage to develop this situation. Therefore he makes the cripple plead the cause of another suitor to the *Fair Maid*, who at the end of the play transfers her affections with a levity and a complacency that would be offensive in real life. The charm of this comedy consists in a certain air of April-morning freshness; it has, moreover, one of Heywood's most exquisite songs, a lyric that deserves to rank with Dekker's, and which is made for music: "Ye little birds that sit and sing." The seven plays on English domestic subjects which I have now enumerated, are all of them eclipsed in their own kind by Heywood's masterpiece, *A Woman Killed with Kindness*. Leaving that, the finest bourgeois tragedy of our Elizabethan literature, for future comment, we come to another group of Heywood's plays, which may perhaps be best described as romances. Of these, *The Four Prentices of London*, a juvenile performance of the poet, is both the least interesting, and by far the most extravagant. Guy, Eustace, Tancred, and Godfrey, the four sons of the Duke of Boulogne, and at the same time 'prentices in London shops, start off like Paladins, and win their laurels in the first Crusade. Whether this absurd play was intended, like Fletcher's *Knight of the Burning Pestle*, for a parody of chivalrous romances, or whether, as its dedication to "the Honest and High-spirited Prentices, the Readers" seems to imply, it was meant for a hyperbolical compliment to the courage of London counter-jumpers, is not a very important matter. The latter is the more probable supposition. The plot is a tissue of sanguinary and sentimental adventures, with a certain admixture of good-humoured sarcasm

on the London cits, that may have gratified their 'prentice-lads. The old quarto has for frontispiece a curious woodcut of the four knightly shop-boys.

The Royal King and Loyal Subject is a drama with an ideal intention. Pretending to be founded upon English history, it really sets forth the contest of generosity between a monarch and one of his great nobles. In the course of this play Heywood has used some of the motives that add pathos to *Patient Grissil*; the King of England exposes the Lord Marshal to a series of humiliations and studied insults before, as a climax to the favour he intends to heap upon him, he unites his own family and that of his subject by a triple bond of marriage. The whole situation is better in conception than in execution. I take it to be one of Heywood's earlier dramatic essays. *A Challenge for Beauty* tells the tale of a proud Portuguese Queen, who thinks herself the fairest woman of the world, but who is brought at the end of the play to admit that she is vanquished as much in beauty by an English lady as her husband's captains are surpassed in courage and courtesy by English gentlemen. The most interesting portion of the drama is subordinate to the subject which supplies the title. The contest of generosity between a noble Spaniard, Valladoura, and an English captain, Montferrers, who has been sold into slavery together with a friend that he dearly loved, displays all that innate gentleness and chivalry which Lamb recognised as the fairest of Heywood's characteristics. Valladoura finds his old enemy Montferrers in the slave-market, pays down his price, and sets him free. Montferrers cannot accept freedom while his friend remains a slave. Valladoura buys them both, taking Montferrers with him to remain, an honoured guest, in his own house. Now begins the duel of courtesy between the two men. Valladoura loves a lady, Petrocella, and beseeches the Englishman to plead his suit with her. Montferrers executes the task, though he also loves Petrocella, and discovers in the course of his wooing that she returns his passion. The use he makes of her avowal is to bind her over to accept the Spaniard's suit. But Valladoura is no whit less chivalrous. He sacrifices the lady to the man who has deserved her best. Those who have not studied the working out of such strained situations in the *Luustspiele* of Heywood or of Fletcher, can hardly imagine what flesh and blood reality these poets gave to almost inconceivable improbabilities. The vigorous and natural play of passions under strange disguises and painful conditions—the hesitations of divided allegiance—confusions of sex—contradictory emotions, pleased our playgoing ancestors; and the dramatists had the skill to display the truth of human nature beneath the mask and garb of romantic fantasies. Under other hands, or in an age of less simplicity, such motives would have been ridiculous or offensive. One of the four plays reprinted for the first time in these volumes, *A Maidenhead well Lost*, is a romance of this type with Italian characters. While challenging comparison with similar comedies by Fletcher, Ford, Massinger, and others, it is but a tasteless and feeble production.

Heywood was so thorough an Englishman that, for the full exercise of his poetic faculty, he needed a subject smacking of his native soil.

Having now described Heywood's Histories, Domestic Dramas, and Romances, it remains for me to speak of the fourth group into which his plays may be divided. At the same time, I should observe that these divisions are, after all, but incomplete and artificial. Many of those which I have classified as Domestic Dramas, for example, borrow largely from the element of romance, while two of them are virtually comedies of farcical intrigue. The *Golden, Brazen, and Iron Ages* form a series of four plays, in which Heywood has dramatised the Greek mythology, following principally Homer and Ovid in the selection of his material. Though there are many passages of delicate and graceful poetry in these long-winded mythologies, they cannot be said to have much value either as dramas or as descriptive poems. That Heywood felt a natural predilection for this kind of composition may be seen in the rhyming versions he has made of Lucian's Dialogues. Some of these, especially the conversations of Jupiter with Ganymede, and of Juno with Jupiter, deserve attention for their plain, straightforward rendering into racy English of the witty Greek. *Love's Mistress*, which is a dramatic translation of Apuleius's tale of Cupid and Psyche, is written in the same mood. It takes the form of a long allegorical masque; and here the poetry is sustained throughout at a higher level. Last of all these classic dramas in my list comes the *Rape of Lucrece*. Here Heywood quits the epical or allegorical treatment of classical subject-matter for the domain of tragedy. Yet he has given to this episode of ancient Roman history more the form of a chronicle-play than of the legitimate drama.

It cannot be denied that the effects of negligence in composition and over-strained fertility are traceable in all that Heywood wrote. He has produced no masterpiece, no thoroughly sustained flight of fancy, no play perfect in form, and very few absolutely self-consistent characters. His finest passages seem to flow from him by accident, as the result of a temporary exaltation of his talent, rather than of settled purpose. His best scenes are improvised. Nor is it possible to evade the conclusion, quaintly phrased by Kirkman, that "many of his plays being composed loosely in taverns, occasions them to be so mean." These defects, indeed, Heywood shared in common with his contemporaries. Not many dramatic compositions of the seventeenth century can boast of classical finish or of artistic unity. Yet there is in the best works of such men as Marlowe, Webster, Ford, and Fletcher, a natural completeness, an unstudied singleness of effect, which Heywood almost invariably misses. With all our affection for him, we are forced to admire his poetry in fragments and with reservations. Perhaps he shows to best advantage in the extracts made by Lamb.

No dramatist ever used less artifice. The subjects which he chose are either taken straight from real life, or else adopted crudely from the legends of ancient Greece

and Rome. In each case Heywood's manner and method are the same. He uses simple, easy English, and sets forth unaffected feeling. The scenes have no elaborate connexion. They cohere by juxtaposition. The language is never high-flown or bombastic: rarely rising to the height of poetical diction, and attaining to intensity only when the passion of the moment is overwhelming, it owes its occasional force to its sincerity.

His means of reaching the heart are of the simplest; yet they are often deep and effectual. He depends for his tragic effects upon no Até, no midnight horrors, no satiric knave. Yet his use of some mere name—*Nan, Nan!*—and his allusions to Christ and our religion, go straight to the very soul. His men are all gentlemen; and it may be said in passing that he had more understanding of men, especially high-spirited young men, than of women. Nothing could be finer than the bearing, for example, of young Forrest when he challenges Rainsford, or of Valladaura and Montferrers, or again of Frankford and Sir Charles Mountford in the *Woman Killed with Kindness*. Now and then he touches the spring of true poetic language, as in these phrases:—

"Oh, speak no more!
For more than this I know and have recorded
Within the red-leaved table of my heart."

Or again:—

"My friend and I
Like two chain bullets side by side will fly
Thorough the jaws of death."

Or yet again:—

"Astonishment,
Fear, and amazement beat upon my heart,
Even as a madman beats upon a drum."

The last line of this quotation is a splendid instance of the way in which the old dramatists heightened horror by connecting one terrific image with another of a different sort, yet, no less terrible. The fury of a lunatic hideously rattling his drum with fantastic gestures rushes across our mind without distracting our attention from the anguish of the man who speaks the words. The simile does but add force to his bewilderment.

J. A. SYMONDS.

The History of India, as told by its own Historians: the Muhammadan Period. Posthumous Papers of the late Sir Henry Elliot, K.C.B. Edited and continued by Professor John Dowson, M.R.A.S., Staff College, Sandhurst. (London: Trübner & Co., 1873.)

THE late Sir Henry Elliot has done much in supplying materials for a complete Oriental history; and by elaborating certain periods in special regard to India has thrown strong light on the student's investigations, and thereby aided the cause of truth and genuineness. And it is fortunate that an editor of his posthumous papers has been found, capable of appreciating the results of his industry, and adding to the data he had so assiduously put together in a congenial and sympathising spirit. The translation of Persian history is not an easy matter even to the best and most experienced scholar. In the first place the eye must become accustomed to the particular chirography adopted, for manuscripts vary in this respect, and print is a little honoured and little

practised exotic. Secondly, the meaning of occasional passages admits of more than one interpretation, and the acceptance of one only involves an appeal to judgment rather than to scholarship. Thirdly, where the original is logically inconsistent and unintelligible, it behoves the translator to do his best to reconcile discrepancies for his own and his clients' credit, or at least in mere compassion to his reader. If Oriental manuscripts varied only as Murray's or Longmans' type from Macmillan's, or the *Times* *pur et simple* from the *Illustrated Times*; if learned Muslims wrote short plain sentences like Macaulay; or if the brain of the Munshi or Mulla was clear of ambiguity and paradox, the case would be different. The Erskines, Briggses, Elliots, and many other *collaborateurs* would then have had comparatively little trouble in elucidating Muhammadan annals; and successful political missions to the East would have merited the honourable oblivion accorded to them in the Western world. But it is not so; and hence none but the initiated can know the reality of the time and labour expended on translation and exposition of Oriental papers; the doubts which rise involuntarily but naturally, amid such occupation, as to the value of such results compared with the irksomeness of the means; and the sensation of working out by such means an intricate end in anticipation of an indifferent reception.

The present volume contains nearly 600 closely printed pages, and is divided into eight articles of unequal length. More than half of the whole matter translated is the work of Mr. Dowson himself, apparently single-handed; and of the remainder he has shared the labours of more than one third with the late Sir Henry Elliot. It is impossible in a few short columns fairly to analyse or epitomise the facts recorded under each separate heading; but we can give a passing glance at the native works which supply the *matériel* before us. They are as follows:—

1st. The *Tarikh-i-Salatin-i Afghana* of Ahmad Yadgar; a history of the Afghan monarchs from the accession of Bahlol Lodi to that period in the reign of Muhammad Shah Sur Adili—the interval between the first and second reigns of Humāiūn—marked by the death of the Hindu Himun; or from A.D. 1450 to 1556. A note in reference to the transactions at the commencement of the reign of Ibrahim Khan Lodi quotes Farishṭa as interpreted by Briggs, remarking on the discrepancy between the two narratives. Judging from the extracts, we think this discordance would be observable generally; a circumstance, however, which should in no way lessen the value of Ahmad Yadgar's chronicle.

2nd. The *Makhzan-i-Afghāni* and *Tarikh-i-Khan-Jahan Lodi*, by Niamut Ullah; the second being a revision of, though not always an improvement on the first, with an additional memoir to warrant the change of title. This work, commencing with Adam, and professing to trace the origin of the Afghans, is condemned by Sir Henry Elliot in no measured terms:—

"Nothing," he says, "can be more meagre than the whole of the introductory book. . . . It is . . . a *rifacimento* of the childish Muhammadan

stories of the Creation and of the prophets, especially Israel and Saul, all of which, as well as the early Muhammadan history, is taken from the commonest sources, without a single independent statement to encourage the least notion of correctness, research, novelty, or probability. . . . The *Tarikh-i-Khan-Jahān Lodi* is," he continues, "as a history of the early days of the Afghans . . . utterly untrustworthy, and should by no means be considered as the basis of the annals of a nation of which we remain as ignorant as if the work had never been written."

The second book is considered valuable as the testimony of one living near the period of which he wrote, but shows certain signs of drawing on the same sources of information as *Farishta*. It is brought down to the year 1612.

3rd. The *Humāiun Nāmāh* of Khondamir, a work of no historical importance, but curious as a specimen of the literature of the times, and illustrative of the court arrangements during the first reign of Humāiun.

4th. The *Tarikh-i-Rashidi*, by Haidar Mirza, cousin of the Emperor Babar. This book is highly commended both by Mr. Erskine and Sir Henry Elliot's editor. It treats of the Moghul Khans and the Kashgar Amirs; of Central Asia during a period of political excitement and interest; and, in the last division, of Kashmir and Hindustan. The specimen quotation given relates to a passage in the adventurous life of Humāiun.

5th. The *Tazkirat ul Wakiat*, or the private memoirs of the Emperor Humāiun, written by his ewer-bearer Jauhar: called also, it appears, *Humāiun Shāhi* and *Tarikh-i-Humāiun*. Major Stewart's translation of this work was published by the Oriental Translation Fund in 1832. The drawback to these memoirs is stated to be that they were begun thirty years after the death of the monarch, who was, *par excellence*, their hero and subject. But they possess originality and quaintness to recommend them.

6th. The *Tarikh-i-Alfi* of Maulana Ahmad, Kazi of Thatta in Sind, a town of repute for artistic handicraft, and withal the seat of much mental industry and book-lore, unconfined to local objects, and extant even under the practical rule of the present day. The Kazi was assisted in his work by others; the compilation having been prepared by order of the Emperor Akbar to supply a history of all Muslim kings from the date of the Prophet's death to the thousandth year of his era. It is thus described in Gladwin's translation of the *Ain-i-Akbari* (p. 104, vol. i.):—

"His Majesty being fond of history, commanded those skilled therein to compile a history of all parts of the world for these last thousand years. It was begun by Nakib Khan and others; and Maulana Ahmad Thattavi had a great share in the compilation; Jafir Beg and Asaf Khan finished it, and the author of this work (Abul Fazl) wrote the preface. It is called *Tarikh Alfi*, or the *History of One Thousand Years*."

7th. The *Tabakat-i-Akbari*, a notice of which book forms article No. 40 of the whole series, and is the seventh of the volume under review. This article, whether length or substance be considered, is of the highest comparative importance. Humāiun and Akbar are the heroes of the chronicle, of which copious extracts are given in illustration. From the statement in the general pre-

face, we presume that these are of the editor's own rendering, while the remarks introducing the particular history are a "re-cast" from Sir Henry Elliot with additions by Colonel Nassau Lees. Regarding this record we are told that it was

"the first that was composed upon a new model in which India alone forms the subject-matter . . . to the exclusion of the histories of other Asiatic countries. The work seems to have been recognised by all contemporary historians as a standard history; subsequent writers also have held it in the highest estimation, and have borrowed from it freely."

Further we learn that it

"cost the author much care and reflection in ascertaining facts and collecting materials; and as Mir Masum Bhakri and other persons of note afforded their assistance in the compilation, it is entitled to much credit. It is the first history which contains a detailed account of all the Muhammadan princes of Hindustan."

The name of the author is Khwājah Nizam-ed-Din Ahmad, whose father was a mere dependent, and afterwards *diwan* of the Emperor Babar.

8th, and last. The *Muntakhab-ul-Tawārikh*, or *Tarikh-i-Badāuni*, written by Mulla Abdul Kadir, of Badāun, and described as "a general history of India from the time of the Ghaznavides to the fortieth year of Akbar." The notice prefixed to the extracts of the translated text is favourable to the author and his performance. Badāuni, while wholly dependent on the Emperor Akbar for pecuniary success in a profession more precarious at all times in Oriental countries than at its poorest phases in Western Europe, is free from that absurd and dishonest adulation of his patron which invalidates the historical testimony of so many native annalists. In respect of style he is considered comparatively difficult for English translators; and though not unworthy the labour necessary to produce a satisfactory result, he is apt to perplex by uncommon words, indulging, moreover, "in religious controversies, invectives, eulogiums, dreams, biographies, and details of personal and family history, which interrupt the unity of the narrative."

These labours must, as we have already expressed, be regarded rather in the sense of supplying materials from which to prepare a complete history, than as actual pages of history itself. Indeed there are, perhaps, few of the authorities quoted in the volume under review that have not more or less been already utilised in some shape by Oriental expositors. The *Tabakat-i-Akbari* has contributed much valuable aid towards the maturation of eminent biographies; and, judging from the foot-notes to his Indian history of Babar and Humāiun, Mr. Erskine has drawn largely from its treasury as well as from Jauhar and Badāuni.

In support of what has been said on the difficulties of satisfactory collation and intelligible translation when Persian manuscripts form the groundwork of operations, interesting and pertinent evidence might readily be adduced. Mr. Blockmann's new version of the *Ain-i-Akbari* will, no doubt, render undesirable the revival of previous interpretations; but the worthy efforts of Mr. Francis Gladwin in the same cause should never be forgotten; and it is now nearly a century ago that we find the latter explain-

ing the more palpable drawbacks to successful accomplishment of his "arduous undertaking." He says: *

"I have rather avoided rendering this translation literal that I might not disgust the reader; but, at the same time, I have endeavoured, to the best of my abilities, to make the author speak in such a manner as I conceive he would have done had he written in English."

Nearly half a century later Colonel Briggs is equally led to explain, in his preface to *Farishta*:—

"Of all the languages in the world the Persian character is, perhaps, the most difficult to decipher with accuracy, and the most liable to orthographical errors. In writing it, the diacritical points, by which alone anything like certainty is attainable, are frequently omitted; and in an alphabet where a dot above a letter is negative, and one below the same letter is positive, who shall venture to decide, in an obscure passage, which is correct? . . . These obstacles occur in every page of *Farishta*; and, unlike a work of fancy or taste, the reader of history is rigidly bound to adhere to the letter of the text."

And he adds,† in almost the precise terms of his predecessor just above quoted:—

"It has been my wish to avoid . . . errors by giving *Farishta* to the public in the very words he would probably have used had he, as a native of the East, written in English."

Without reference to the Persian originals, it would naturally be impossible to form a judgment on the fidelity of any particular translation; but the passages cited in pages 108 and 132 are good examples of constantly recurring perplexities. Disposing of the second of these by a surmise that Mr. Erskine has hit the true meaning, and that the personal pronoun is misplaced or superfluous, we note, for juxtaposition, the respective versions of the Persian text under discussion in the first.

One of Sher Shah's dying regrets is thus rendered by Dorn. He had failed to erect, for the use of pilgrims, "from fifty to fifty-four solid edifices on the road from India to Mecca." Professor Dowson, on the other hand, defending, it is conceived, Sir Henry Elliot's accuracy, interprets this especial sorrow to be that he had not "built two fleets of fifty large vessels each, as commodious as sarāis, for the use of pilgrims from India to Mecca." We venture to think the latter meaning substantially the correct one, though a modification might be suggested to construe more literally a not very practical notion.

F. J. GOLDSMID.

The Working Classes. By Charles Lamport, F.S.S. (London: Trübner & Co., 1874.)

PARTS of this essay show how much sounder and more useful a contribution to the economic and social questions it discusses its author might have made, had he not set out with speculative assumptions such as that respecting the influence of race. "The characteristics of the British workman," Mr. Lamport maintains, "belong to him by hereditary descent." . . . "While M. Nadaud

* Preface to *Ain-i-Akbari*, quoting Fort William Consultation, June 2, 1783. (London: Sewell and others, 1800.)

† *History of the Rise of the Muhammadan Power in India*, Translator's Preface, vol. i. (London: Longmans, 1829.)

ascribes the English workman's independence, his love of liberty, his obedience to law, and the elements generally of his social progress to Protestantism, we would go deeper, and ascribe that Protestantism to his race." Is this really going deeper? If the Protestantism of the English workman is to be ascribed to his race (a very mixed one in most English towns), how does Mr. Lampport account for the fact that the German workman is a Protestant in one State or province, and a Catholic in another, according to the religion established in former times by the government of the place? If the characteristics of "the British workman" belong to him by hereditary descent, what hope could anyone have felt during the last hundred years for the future elevation of the British agricultural labourer? The assumption that the character and condition of the working or other classes, in this or any other country, are the results of original and inherent qualities, stands in the way of all patient and accurate study of history, and of the influence of laws and external circumstance; and operates like fatalism as a discouragement to all practical efforts for reform and improvement. If the whole historical career of the workman is a development of race characteristics, what use or need of social philosophy and enlightened legislation? How the doctrine of race operates as an obstacle to the accurate study of history, Mr. Lampport's essay affords some striking examples. He stumbles in his first page. We must confess our inability to understand his statement with respect to the self-elevation of the working-classes, that "the first break in the meshes was made in 1247, when privileges in kind, the chief characteristic of feudality, gave place to the payment of money wages." The next sentence involves more than one error. "In 1350, the 'free' labourer was first specifically noticed by the Legislature." The "free labourer" had always existed, not only in the emancipated serf, but also in the poor freeman and his children; and the tyrannical ordinance called the Statute of Labourers, which was passed in 1349, instead of ratifying his freedom, treated "free and bond" alike, and aimed at reducing the former to practical servitude by the enactment that every man and woman under sixty, "free or bond," having no independent means of livelihood, should be bound to serve, when required, at the old rate of wages given before the plague. Mr. Lampport makes no reference at all to the plague, which was the main cause of the rise in the price of labour. And if the growth of manufactures in towns at that period did so much as Mr. Lampport supposes for the elevation of the labourer in the country, we cannot see why he should be said in emphatic italics to have "raised himself," as though economic conditions, not of his creation, had contributed nothing to the result.

An instance of Mr. Lampport's tendency to hasty and inaccurate reasoning presents itself again in the following passage respecting "the English workman":—

"The peculiarities of his mixed genealogy are the foundation of his industrial success. . . . Perhaps to his native coal and climate he owes (besides industrial pre-eminence) his bright fire-

side influences, bringing in their train cleanliness and the domestic virtues."

It is not easy to reconcile the proposition that his mixed genealogy is the foundation of the English workman's industrial success, with the suggestion immediately following, that he owes his industrial pre-eminence to coal and climate. Our own observation, moreover, of the working people of different countries by no means leads us to the conclusion that superior cleanliness is a characteristic of the English labouring class. Coal, indeed, can hardly be said to promote cleanliness in our great smoky cities; it makes it almost useless for the mass of the London population to try to be otherwise than dirty six days out of seven; and no city population in Europe looks more unwashed. It is chiefly in his opening pages that Mr. Lampport lays himself open to criticisms like the foregoing. The remainder of his essay contains much sound and sensible observation, in spite of imperfections of style. For instance, the two following passages:—

"We wish we could be sure that the Sir Wilfrid Lawsonites have not discredited and prevented the working of what Dr. Chalmers beautifully calls 'the expulsive power of a new affection' in the hearty application of the persuasive influences of healthy amusements, comfortable houses, social clubs, reading rooms, free libraries, and general culture. These counter attractions are not, unfortunately, heroic enough in their treatment, nor swift enough in their effect, to suit the impatient philanthropy of the gentlemen of the Alliance." (p. 12.)

"We can hardly over-estimate the beneficial influences of the educational process going on within and beyond the vast organisation of trades unionism. No less than 900,000 persons, mostly heads of families, are daily and hourly subjected to its developing and beneficial power. It furnishes to their thought, to their workshop talk, and to their leisure resources, 'the expulsive power of a new affection' to the low enticements of the public-house."

There are likewise some good remarks on demand and supply in relation to wages, and on co-operation. We must, however, demur to the definition, though it is one not unsupported by high authority, that "capital is simply accumulated or stored labour." The labourer is not the sole factor in the production either of wealth, or of capital which is wealth applied to production; natural agents, the invention and exertions of the capitalists themselves, contribute along with labour to the formation of capital; and an erroneous doctrine, injurious to both employers and workmen, that "profit depends on the cost of labour," originated in the neglect of two of the three elements on which both the production of profit and the accumulation of capital depend.

T. E. CLIFFE LESLIE.

Adventures in Morocco, and Journeys through the Oases of Draa and Tafilet. By Dr. Gerhard Rohlfs. With an Introduction by Winwood Reade. (London: Sampson, Low & Co., 1874.)

THE unpleasant controversy which has arisen about the authenticity of this book is due entirely to the carelessness with which it has been introduced by its publishers and editors to English readers. It was advertised as a new book, and as edited by Mr. Winwood

Reade, and altogether in a manner calculated to lead the unwary to anticipate from Messrs. Sampson Low & Co. such another great book of strange travel and exciting adventure as Schweinfurth's *Heart of Africa*. The very appearance of the book, after so imposing an advertisement, its vulgar binding, and sheets barely more than glued together, its want of illustrations and the irritating map, are a cause of disappointment, and provoke one instinctively to fault-finding with it. Nothing is said of the work of which it is a translation, or if it is a translation at all; and it might well be taken for a hasty and inaccurate compilation by some heedless editor or speculative publisher of odds and ends of papers contributed by Dr. Rohlfs to Petermann's and other journals, vamped up to catch the occasion of the popular interest in Africa. It is a genuine book, of course, although it was almost necessary to have Dr. Rohlfs' word for it—and in fact is a free translation of a book published by him in Bremen (Kühnert) last year, *Mein erster Aufenthalt in Marokko*; a compilation, in which he has worked up a general account of Morocco, brought down to the present day, with the account of his residence in Draa and Tafilet in 1861–63, originally published in *Petermann's Journal* for 1863. The book is divided into fifteen chapters, of which the first, sixth, seventh, eighth, ninth, twelfth, thirteenth, fourteenth, and fifteenth are taken up with the account of his travels in Morocco; and the second, third, fourth, fifth, tenth and eleventh with the general description of the country and its people. And of these chapters, the sixth and twelfth on Uesan, and the seventh and eighth on Fez, originally appeared in the *Ausland* for 1871 and 1872; the fourteenth and fifteenth on Draa and Tafilet in the *Mittheilungen* for 1863. Also of the chapters on the moral and material condition of Morocco, chapter the second on its climate and soil, the fifth on its diseases, and the twelfth on the European Consulates, have already been published in the *Ausland* for 1871–72; and the third, on religion, in the *Globus* for 1871. All this should have been stated by the publishers, or by the advertised editor, Mr. Winwood Reade. It was, however, carelessly withheld by the publishers, and it appears that Mr. Winwood Reade never edited the book at all, and is responsible only for the perfunctory introduction with which it is prefaced—in the place of Dr. Rohlfs' own *Vorwort*. Mr. Winwood Reade stumbles in the first page and very first line of his "Introduction." He places the "African Sahara" on "the Eastern side of the Egyptian valley;" and a few lines lower down he says of Cyrenaica that "it produced assafoetida or silphium." Dr. Rohlfs has so much of interest to tell us of the materia medica of Morocco, and Africa generally, that it may be as well to note here that assafoetida is certainly not the same drug as the celebrated silphium (*Laser Cyrenaicum*, *succus Cyreniacus*) of ancient Cyrene, which, moreover, is now on the best grounds identified with the *Thaspia Silphion* of Viviani, which Della Cella found to be the only umbelliferous plant from Zardes to Grennah in Barca, and to correspond with the figure of the *σιλφιον* on the

Cyrenaean and Barcaean coins. This silphion was probably a royal monopoly, and the chief source of the wealth of the Bat-tiadae, as there is an antique vase (*cylia*) extant, on which there is a representation of the King Arcesilaus weighing out the drug for sale; and which is figured (frontispiece) in colours by Dr. Birch in the new edition of his *History of Ancient Pottery*. This precious *Laser* or *Asa dulcis* of Cyrene appears soon to have become exhausted, and Pliny tells us that for a long time before his days the only *Laser* known was that which was produced in Persia, Media, and Armenia, or *Asa-foetida*. A good map is very necessary to the comfortable reading of a book in which the narrative of travel is continually broken by chapters on special subjects; but the map attached to this book by Messrs. Sampson Low and Co. is not simply worthless, but utterly misleading. The map scarcely ever follows in the names of places the spelling of the text, and exhibits routes as followed by Dr. Rohlfs which, in the explorations described in the present volume at least, he never took. This is quite without excuse.

All these drawbacks to its popularity notwithstanding, the present translation is a most valuable addition to our knowledge of Morocco. There are books enough about the country, but none which bring down our knowledge of it to so recent a date, or which give so clear and intelligible a forecast of its future prospects. Previous authors have, for the most part, been acquainted only with the coast towns and populations. But Dr. Rohlfs, adopting the garb and religion of the Moors, entered the service of the Sultan as surgeon, resided at Fez, crossed the Atlas and the whole country behind them from the Atlantic to Algeria. Starting from Tangiers, Dr. Rohlfs proceeded along the coast to (following the map) El Araish, whence he struck inland to Wazen, Fez, and Mequenez. Returning by Wazen to the coast, he followed the shore of the Atlantic to Agamore, whence he made a second inland excursion to Morocco, the capital of the kingdom; and again going back to the coast, he followed it southward through Saffee and through Mogador to Santa Cruz or Agadir. From this point he struck inland almost due west, and across the Atlas to Tanzetta, and thence southward to the oasis of the Wady Draa about 29° south, and 4° 30' west. This was his most southern point, and he now turned his course north-eastward by the Oasis of Taflet and across the French frontier of Algeria to Géryville and Algiers. He thus penetrated to all the chief towns in the interior, and, excepting the Riff Coast, made the complete circuit of the kingdom. Dr. Rohlfs is the first European explorer who has made the dangerous journey from Agadir through Draa and Taflet to Géryville, the account of which, given in chapters xiv. and xv., is now for the first time made accessible to English readers. The dangers of the way were only too painfully experienced by Dr. Rohlfs. When he reached the Oasis of Boanan, north-east of Taflet, he was received in a very friendly and hospitable manner by the Sheik of the village, Thaleb Mahommed:—

"For ten days I was the guest of this man,

and daily ate of the same dish with him. I was induced to make this long stay here because Thaleb Mahommed was of opinion that I should not journey further except with a large caravan, the country becoming more and more unsafe as the Algerian frontier is approached. At that time I was under the illusion, begotten of the tales of travellers who have only superficially glanced at Mahommedan life, that whoever has eaten with a Mussulman out of the same dish is held sacred and safe from hurt. At that time I still believed in the sacred rights of hospitality. One day I was careless enough to let my money be seen. I had in all about sixty French dollars, and a few dollars' worth of Moroccan small coin, which I offered in change with the Schiek for French, as I knew that the former would not pass in Algeria. Thaleb Mahommed changed the money: but I am now certain that, from the moment his eyes rested on my little hoard, he had determined to murder me. There was no more talk of waiting for a caravan. He was suddenly of opinion that, with the help of a servant, I could easily reach the Knetsa oasis. . . . We started in the evening, there being, besides the guide and myself, a pilgrim who, in return for his food, had accompanied me as servant from Draa. After a four hours' march, we camped near a stream. . . . The pilgrim and I were soon stretched asleep. . . . How long I had been asleep I cannot say, but when I awoke I found the Schiek of the oasis, my friendly host, standing over me, with the smoking mouth of his long gun still pointing to my breast. Luckily he had not struck my heart—had only broken my left arm above the elbow. I was seizing my pistol when he slashed my hand nearly off with his sabre. From that moment . . . I became unconscious. . . . Next morning I found myself alone with nine wounds. . . . I remained in this helpless condition for two days and nights."

He was rescued at last by some chance wayfarers, and taken to the Oasis of Hadjni, to the house of the Sheik of the place, Sidi-Laschmy.

"I desired Sidi-Laschmy to sever my hanging arm. 'That may be the custom among you Christians,' said the Marabout, 'but we never cut a member off; and as you, praised be God, are now in your right senses, you will retain your arm.'"

And bandaged in goatskin smeared over with clay, and rested on a pillow of soft desert sand, he kept it, although it was not properly healed until 1868, after—with the wounds still open—Rohlfs had made the journey across the African continent, from Tripoli, *via* Lake Tschad, to the British settlement of Lagos in the Bight of Benin, and accompanied the Abyssinian expedition. One of the most instructive chapters in the book is the eleventh, on the Foreign Consulates established in Morocco. It appears that the influence of England is paramount with the Government; and he describes Sir Drummond Hay as "the secret ruler" of the country. He characterises as unwise the voluntary surrender of Tangiers by England in 1684, and believes that its possession, or that of Ceuta, by us would be most advantageous to our interests in Morocco, now that Gibraltar, in consequence of the introduction of steam ships, no longer commands the entrance to the Mediterranean. Gibraltar, he takes care to inform his readers at full length, was captured for us by "the Imperial Field Marshal Prince George of Hesse Darmstadt." Dr. Rohlfs gives a most intimate and interesting account of the Grand Sherif, or head of the direct descendants of

Mohammed in Morocco. He is enormously rich; and Uesan (Wazen of map), where he resides, is a city of refuge; and his house is a shrine to which pilgrims resort from all parts of the country. This is the man whose recent marriage with an English woman first brought him into prominent notice in this country. Mr. Winwood Reade suggests that this marriage may have deprived him of his spiritual power. Rohlfs found him on his first visit in European dress, but on a subsequent visit he had, in subservience to the popular prejudice, given it up; and it is not unlikely that his English wife will share the fate, if she have not already done so, of his French clothes, so soon as he finds that his latitudinarian marriage with her is staying the offerings of his bigoted followers. The book abounds with valuable information and lively incidents; and it is only to be hoped that when Dr. Rohlfs' great work on the Libyan Desert appears, it may be brought out with the care and thoroughness befitting its subject and its author's deservedly high reputation as a daring, intrepid, and indomitable geographical explorer. GEORGE BIRDWOOD.

THE GERMAN ARTILLERY BEFORE METZ.

The German Artillery in the Battles near Metz. Compiled from Official Reports, by Captain Hoffbauer, of the Prussian Artillery. Translated by Captain Hollist, R.A. (London: H. S. King & Co.)

It argues either an extraordinary demand among us for a thorough knowledge of the late war, or extraordinary enterprise in the publishers, that so many purely technical military works from the German have lately been added to our libraries. Translations of this class of books were seldom issued until after the war of 1866; and the few that did appear were rarely successful. But for this there was a special reason, that has vanished with many other delusions attached to the Second Empire. It was taken for granted, until the sudden burst of glory came which shone on the Prussian standards in Bohemia, that France was essentially the one military model for the rest of the world to imitate, in theory as well as in practice, and that British officers who were devoted to their profession could follow no other guides with safety than Jomini and the lesser writers of his school. And as the great majority of such officers could read the language fairly, there was little necessity apparent for spoiling the excellent prose, which is often the best point of a French technical treatise, by turning it into indifferent English. Sadowa changed our views considerably on this, as on many other continental questions. A grand harmony became suddenly apparent in the involved sentences and rugged paragraphs with which North German writers usually clothe their ideas. Patriotic sentiments that would have seemed stilted and ludicrous to an English eye, if read after the failures of Prussia in 1850 and 1859 to impress the world with a notion of her purity in politics and her might in action, became eloquent with meaning when the most veteran soldiers of Europe recoiled shattered before the breech-loader on the fatal slopes

round Nachod, Gitschin, and Koeniggrätz. And when the same generals, of names hitherto unknown out of Prussia, who had beaten Benedek's lieutenants so sorely, triumphed with hardly less ease over the marshals whose hardly-earned fame rested on battles won in three quarters of the globe, all the military world of Europe became as suddenly impressed with the necessity of studying the Prussian model, as it had been four generations earlier, when Frederick the Great smote the armies of all the then Great Powers of the continent in rapid succession with his ubiquitous battalions. But German, professional German especially, is not to be mastered at a wish; and German writers have long been as prolific as they are now found to be instructive. Hence, an entirely new and wide field was thrown open to the enterprise of publishers; and those of our own metropolis, led in this matter by Messrs. King and Co., seem to vie with their brethren at Paris in the variety and excellence of the works thus "conveyed" from the late victors, now become the acknowledged military teachers of friend and foe alike.

The results of this sudden fashion are sometimes a little ludicrous; for if there be a mere ordinary discussion on some minor point of drill at Berlin, the representative pamphlets at least on either side are forthwith advertised in their French and English dresses; and some of the works thus hastily translated are probably thought more of in these, than they ever were in the original by that great caste or class (the word *officier-corps* has no proper equivalent out of Germany) for which they were written. But this is by no means the case with the book before us, which though on a peculiarly technical subject, and truly Teutonic in its learning, is by no means of the military Dryasdust type. Captain Hoffbauer has undertaken to write a narrative of his own special arm, that noble Artillery which, stung, as many think, by the reproaches of Captain May, in his essay on the war of 1866, or stirred by a famous prophecy of his as to its possible value, made the most marked advance in its performances in 1870 from the comparative backwardness it showed four years before. Recognising very properly the impossibility of executing his work with thoroughness unless he limited its scope, he confines himself solely to the three great battles before Metz which sealed the fate of Bazaine's army of the Rhine, and so practically settled the war in favour of the author's country. As it would be undesirable, even if it were possible, to give the details of what the artillery did in those famous actions of Borny (Colombey-Neuilly, as it is now perversely termed at Berlin), Mars-la-Tour and Gravelotte, without tracing the whole course of each action, and showing the connexion of the efforts of the batteries with those of the cavalry and infantry, Captain Hoffbauer is insensibly led into a complete technical narrative, and does justice to the whole of the forces concerned, not excepting the gallant French, who fought nobly at particular points under most indifferent leadership. His versions of Borny and Mars-la-Tour may to many readers appear forestalled by the official Moltke Narrative of these battles,

which has been, or is being, translated into all the important tongues of Europe. But in that given by him of Gravelotte, among other very interesting points, this author brings into clearer light than has been hitherto done, the crushing effect of the artillery in the great concentration of that arm for the attack on St. Privat. The rival French account of Montluisant, which declares that "the Prussians crowned the heights to the right and left with more than sixty guns, which deluged us with shell," does not by one half do justice to the efforts made by Prince Hohenlohe to prepare completely the final success of the Guard and Saxon infantry. Instead of sixty guns, we learn from Captain Hoffbauer that "just before the assault, the fire of thirty-two batteries (192 guns, including those dismounted) was concentrated on St. Privat. The effect was decisive." And no wonder, when we know from this work that the French ammunition park which should have kept up Canrobert's supplies was not present, and that that marshal's pieces were reduced to absolute silence at this crisis for want of cartridges. His artillery only withdrew after firing its last round, as is here particularly asserted by one of its actual opponents (for Captain Hoffbauer was himself engaged in the attack) to the lasting honour of Colonel Montluisant, who commanded it, and whose report is quoted and done full credit to.

This episode is but a sample of the interesting matter that the work offers to students of the greatest battle of a great war, one far more obstinately fought by the losers than that of Koeniggrätz, though the defending army that actually resisted Moltke's blows was much less numerous than Benedek's. It remains to be added that Captain Hoffbauer's style is much more simple and agreeable than those of many of his comrades and fellow-authors, and that it suffers nothing in the hands of Captain Hollist, whose translation is close and faithful, without that servile copying of cumbrous Teutonisms with which some of this new branch of our military literature is defaced. In short, he has given the general public a readable and instructive book; whilst to his brother officers, who have a special professional interest in the subject, its value cannot well be overrated.

CHA. C. CHESNEY.

Calendar of State Papers and Manuscripts relating to English Affairs existing in the Archives and Collections of Venice, and in other Libraries of Northern Italy. Vol. V. 1534-1554. Edited by Rawdon Brown. Published by the authority of the Lords Commissioners of Her Majesty's Treasury, under the direction of the Master of the Rolls. (London: Longmans & Co., 1873.)

(Second Notice.)

In a previous notice of this valuable volume of Venetian documents, we for the most part confined our attention to those which had relation to the reign of Edward VI., and especially to the letters which illustrated the life and character of Cardinal Pole. We purpose in this article to give some account of a few papers which have been

thrown into the Appendix, having come to light too late to be inserted in their proper places in the preceding volumes. Some of them go back as far as the fourteenth century—there being no less than twenty-four documents which belong to the year 1376 which may all be classed under one head, viz.:—Acts of the Venetian Senate respecting the Signory's negotiations with Sir John Hawkwood for military assistance against the Archdukes of Austria. But the papers to which we want now to draw especial attention are twenty-four letters which belong to the years 1531 and 1532, the last two of the six years during which the case for the divorce of Catharine of Aragon was proceeding, ending with the period just preceding the time when the Gordian knot was cut by the actual marriage of the King with Anne Boleyn. They consist almost entirely of letters written from Paris by the Venetian ambassadors to the Doge and Senate, and they are the more important because of the scarcity of documents of this period already published. There existed scarcely more than twenty, which had been published in the *State Papers of the Reign of Henry VIII.*, and the *Records of the Reformation* contain about twenty more belonging to the year 1531. We have here an addition of about the same number, specially informing us of the attitude of the French Court at the time when the Breve had been issued prohibiting the King from marrying any other woman whilst the cause was pending. This Breve, which was printed by Le Grand, is dated January 5, 1531, and was supplemented by a temperate letter from the Pope to the King two days afterwards, in which Clement acknowledges with all due courtesy the intercession of the English nobility and the petition of Francis on the subject, but insists that upon the Queen's appeal to him not to decide the cause in England, where she cannot have justice done her, he is obliged to advocate it to Rome.

The Venetian ambassador reported, January 19, that the relations between France and England were becoming daily more and more intimate; and on the very next day, Bryan, Anne Boleyn's cousin, reported to his master the French king's speech, "Let the Pope and the Emperor do what they list, I will be the king my brother's friend in spite of them all, in right or wrong." Nevertheless the correspondence shows that Henry distrusted Francis considerably, and not without some reason, when he remembered how little store the French king laid by promises and oaths. It is amusing to see the ground of the suspicion, in the Pope's having stated to the Cardinal de Grammont, what was undoubtedly true, that he had seen and heard the opinions of many jurists about the divorce case of England, affirming that the original dispensation for it was invalid. Of course this was simply a matter of fact, for the whole of the preceding year had been spent in procuring by fair or by foul means opinions in favour of the divorce; but the information as it passed through the medium of the French king to Henry was no doubt coloured with the opinion that these determinations had influenced the Pope's judgment, and the King of England thought that there was an inconsistency between this

information and that which he received directly from his Holiness, and so feared that Francis was in a conspiracy with the Pope and the Emperor to prevent the divorce. The divorce seems to have been the principal topic of conversation between Francis and the Venetian ambassadors. The French king expressed his sympathy with Henry in the case, because he had no son to succeed him, saying that if he were to die without an heir male, the peasantry "would all cut each other to pieces, as they did some fifty years ago; for wearing no armour, they all fight to the death. Nor do they obey any one, as nobody either pays or leads them; nor do they then acknowledge any superior but according to their own caprice and insolence." In the course of conversation the King seems to have spoken out most incautiously to the ambassadors—actually alluding to the secret measures which had been adopted for his release from imprisonment in Spain. He laughed as he told them of the Emperor having been deceived by the physicians into the idea that Francis was consumptive, and that it would be therefore worth while to exchange him for his two sons. "I was content," he said, "that they should entertain that opinion. They ferried me across the river, and to be in France sufficed me." The Venetian ambassadors improved the occasion by taking the opportunity of assuring the French king, in order to its being reported in England, that the Republic had never, as it had been accused of doing, canvassed against the divorce.

Writing on the 15th and 24th of March, the ambassadors of course enter on a minute description of the new Queen's coronation at St. Denis on the 5th, and her subsequent entry into Paris on the 16th; but there is a significant silence as to the King. Nothing more is said of him on either occasion, except the following remark as to the day of the coronation: "His most Christian Majesty was absent, nor is he known to have been at St. Denis on that day" (p. 616). We learn from a ciphered despatch from Bryan to the King of England, what the Venetian ambassadors were perhaps too prudent to comment on, that "the same day she should make her entry into Paris, he having knowledge where Hely (i.e. Anne de Pisseleu, his mistress) and divers other ladies and gentlewomen stood, took with him the Admiral and the Cardinal of Lorraine; and they finding these gentlewomen in the said house, the French king took Hely and set her before him in an open window, and there stood devising with her two long hours, in the sight and face of all the people, which was not a little marvelled at of the beholders."

The paucity of Records of the year 1531 is so remarkable, that the letters contained in this Appendix have a special value. The transactions between England and France of this year are very obscure, and many allusions are here made to events which are not recorded even by Herbert in his history of the reign of Henry VIII. It appears that messengers were continually going backwards and forwards between the King and Sir Francis Bryan all the spring and summer; but even with the help of these Venetian papers, it is impossible to make out exactly the persons who were sent, or the

purport of their mission. We only know in general that jealousy of the apprehended union of Francis with the Emperor, and consequent fear as to the part which the French king might take in the matter of the divorce at the Papal Court, was the cause of all the uneasiness felt by Henry. The ciphered despatch sent May 19 by Giovanni Antonio Venier to the Doge and Senate, is worth quoting at length, both for its facts and as indicating the sagacity of the Venetian ambassador.

"Although the other ambassador, Sir Francis Bryan, is here, and remains, a new one has come for the purpose, it is said, of attempting the things which have been already tried and negotiated, viz., to induce King Francis to declare himself hostile to the Emperor, which, however, he will not do; for, as we told your sublimity heretofore in the despatch written when we were three ambassadors, the most Christian King will slide on, cajoling either party, knowing that both sovereigns are by nature inimical to him, and being certain that were he to make war for the English king, it would not be for a prince who either loves him or wishes him to gain glory; but these requests will end with a demand for money on account of the debt due to him from King Francis, whom he continues to dun, although a month has not yet elapsed since some 33,000 crowns were paid him on this score at Calais, and possibly within a few days he will receive another instalment" (p. 623).

Before the end of July, Gardiner had been sent on another mission to Bryan, and had returned. In September, as we learn from the *Records of the Reformation*, ii., p. 139, Foxe was sent, and this proves the correctness of the conjecture that the other ambassador alluded to in a letter of October 10 was Edward Foxe. In November there were three ambassadors at the French Court—Bryan, Taylor, and Foxe. Venier gives their number without mentioning their names, and Mr. Rawdon Brown, in a note, says that he is unable to ascertain who the third ambassador is, as there is no mention of him in the State Papers. Bryan and Foxe are mentioned October 7 (*State Papers*, vol. vii., p. 326). The third name is supplied in a document published in the *Records of the Reformation*, vol. ii., p. 120; and we are indebted to these Venetian Papers for being able to correct the date assigned by the editor of those volumes to a despatch addressed to them from the King. It is erroneously ascribed to March 1531, instead of December of that year—the time when the utmost jealousy prevailed as to the meeting of Francis and Charles somewhere on the confines of their respective dominions. For the benefit of any who may be interested in settling this point, we refer our readers to Letter ccvi. in State Papers from Henry to his orators at Rome; the despatch numbered 1023 in this volume; and Nos. ccxli. and ccxlix. in the *Records of the Reformation*.

A month later the newly-made Bishop of Winchester, Stephen Gardiner, arrived, as was supposed by the Venetian ambassador, for the purpose of strengthening the alliance between the two kings, though, he adds, no such result was visible. We learn from the *Records of the Reformation* that Gardiner had arrived quite at the beginning of the year, as he wrote to the King on the road, on January 4 and 7. The mode in which

Anne Boleyn was spoken of was as follows: "Here at the Court the Bishop says openly that his King chooses that woman, but that he continues anxious about the affair of the divorce."

The next and most important despatch from Venier to the Doge and Senate is dated October 31, 1532. It contains the ciphered portions of a letter which was printed in the fourth volume of the Venetian Calendar, and alludes to the interview of the two kings in that month; and Venier gives the report that Henry had brought Anne Boleyn with him, with the firm determination of marrying her, with the intervention of King Francis, adding: "His most Christian Majesty seems to have modified this determination at the conference, so that it was not carried into effect; and, to say the truth, the French and English believed it to be certain, and the said English are very well pleased that the marriage did not take place." Of the other *on dit* retailed by the Venetian ambassador, only one half was destined to take effect:—

"It is said that these two kings have agreed that, should the Cardinals (i.e., Tournon and Grammont) not succeed in persuading the Pope to comply with their Majesties' wishes, namely, to detach him from so close an alliance with the Emperor, or should he make any new agreement in Italy, in either case they will no longer allow the collation of the benefices of France and England to be referred to Rome, but separate their clergy entirely from the Roman see. It is also generally reported that the interview between these two great kings merely caused immoderate expense, entertainments, and pageants, and no effect whatever equal to the expectation."

In conclusion, we must express our regret that our narrow limits do not allow us to notice the many valuable documents which refer to the reign of Queen Mary. In attempting to notice a wider range of papers than we have commented upon in these two articles, we should, we fear, have rendered them scarcely intelligible to ordinary readers of history. As regards the execution of the work, we can only express our high opinion of the ability and discretion of the editor. We shall look forward with pleasure to the appearance of the next volume, which will contain, amongst other documents, the despatches of Michiel, some of which were deciphered and published by M. Friedmann, at Venice, in the year 1869.

NICHOLAS POCOCK.

NEW NOVELS.

Rose and Rue. By Mrs. Compton Reade.

(London: Richard Bentley & Son, 1874.)

Sunken Rocks. By Aubrey Pantulf. (London: Chapman & Hall, 1874.)

After Long Years. By M. C. Halifax. (London: Macmillan & Co., 1874.)

Old Fashioned Stories. By T. Cooper. (London: Hodder & Stoughton, 1874.)

THE effort to "see things as they are," and to estimate the qualities of the novels of the week, is rarely impeded by a sentiment of gratitude. But our gratitude to Mrs. Compton Reade for *Rose and Rue*—a story which compels the reader to look how it ends, as soon as he makes acquaintance with the heroine—is a feeling so strong that very possibly we exaggerate its merits. The

character of Tryphena Fowke is so sweet and her history so pathetic, that we do not care to object to sentences *plus-quam* Thucydidean in their length and difficulty of construction. Tryphena is one of those girls whom novelists love, and who therefore may be expected, like the favourites of the gods, to die young. But she does not. We thought to have strewn her grave, sweet maid, and not to have decked her bride bed. It shows immense self-control on the part of Mrs. Reade that she has spared the feelings of every sensible heart, and denied herself the opportunity of a harrowing death scene.

Rose and Rue begins with an attempted murder. A young gentleman named Valoynes, a philanthropic landlord in times when philanthropy had not been made easy, is wounded by a highwayman and carried into the house of Farmer Fowke. The introductory scene is very well managed, and, as one of the characters says, "it did not happen the least as it would in a story." It is an open secret to the reader that the farmer himself was the robber, but of course no notion of this ever occurs to the hero or to Tryphena, the farmer's daughter. She is one of the women out of whom the Church makes saints, and she lives among people so coarse and hard that her ideal life is that of a missionary among those lands

Where the skies for ever smile,
And the blacks for ever weep.

The wounded Valoynes and she naturally fall in love, and the course of the passion is rendered rough by the difference between his positivism and her piety, and by the fact that the dissenting minister has set his heart on her; and as he knows enough to hang her father, possesses that relative's vote and interest. This is the plot of the story, which fills three volumes, without dragging for a moment.

It is easy to say in a short notice that a novel is bad, and even to make it go near to be thought so, but it is hard to put much praise into few words. The great merits of *Rose and Rue* are the continual flow of natural humour, and the curious sympathy with the lives of the rural poor. These qualities are so eminent as to suggest comparison with the highest of contemporary novelists. With the exception of Latchet, the minister, who is too cultivated to adopt Mr. Bulstrode's compromises, and who surely would not have fallen into King Valoroso's error of mistaking blank verse for argument, the characters are very carefully and consistently drawn. Even the consumptive girl and the idiot boy of fiction are made new things. The squalor of their sad lives is more prominent than the poetry; and Clara is more real and touching than the poor stagey "May Queen." The very animals in the book are worthy of Mr. Rivière, and the death of Beauty is as touching as that of any hound since "the fate of death came upon Argus" in the courtyard of Odysseus Laertes' son. Our gratitude to Mrs. Compton Reade is of the kind which looks for even greater favours to come, and we hope that her next novel may be not unlike her first, but more fortunate in its grammar.

Sunken Rocks raises three questions which may amuse people of leisure who have become sated with the joys of double acros-

tics. Why was *Sunken Rocks* written? where are the persons who would willingly read it? and why is it called *Sunken Rocks*? We advise the curious to consider these problems *à priori*, for the book itself fails to throw any light on them. The interest of the work, if interest it may be called, turns on the rivalry of two cousins—the conventional good and bad heroes. The bad hero, Philip, by a series of dexterous forgeries, succeeds in inheriting the property of his uncle, and in marrying the *fiancée* of his good cousin Bertram. After five years of anything but enjoyment of these ill-gotten gains, his wife leaves him, not without a fair excuse. She had discovered that Philip intended to murder her, and this she could not stand. The patience of a wife has its limits. Misfortunes now thicken around Philip. The clerk who had helped him in his forgeries denounces him; and Philip takes poison from a gold and enamel locket which he kept concealed about his person for emergencies of this sort. Bertram becomes heir-at-law, and marries Philip's wife. The book closes with a sketch of their happiness, and we are glad to get rid of them on any terms.

If these amiable young creatures lack interest for the reader, he may seek for more in the innumerable minor characters constantly ushered on the festive scene. Dr. Bilston is the most agreeable of these. He is the assassin whom Philip engages to "take off" his wife, and the amateur in murder is a little surprised that the doctor does not try to poison her, but endeavours to hurl her over a cliff. In point of fact he was an unscrupulous wretch who possessed no diploma, and very wisely trusted to nature's weapons. The humour of the book entirely consists in such names as Bubbers and McTwaddles, and in the introduction of a German who talks English as bad and as wearisome as the French of Schmidt in *Le Cousin Pons*.

After Long Years is a story which it is difficult to praise, or blame, or laugh at, or cry over. The misunderstanding whose duration gives its title to the book is one of those familiar to novelists, but rare in real life. Joan Lloyd, a girl who has spent all her life among the Monmouthshire hills, in such seclusion that she had never seen a dance, nor knew the meaning of a flirt, goes to pay a visit to her brother in Newport. In the gilded saloons of that city she makes the acquaintance of Mr. Homfray Dynevor, and ultimately becomes engaged to him. An obstacle to their union appears in the person of Mr. Jarvis, who is anxious to secure Homfray for his own daughter, for no very obvious reason. The easy stratagem of forging a letter from this daughter Flora to Joan at once occurs to him. Joan is pathetically implored to give up her lover, which she does, and, of course, refuses to listen to any explanations from any one. Explanations are the root of all evil, but there are exceptions. How much more nice and natural it would have been to have introduced some woman who had designs on Mr. Jarvis—a widower—and to have made *her* forge the letter, in order to get rid of the daughter. It is thus that the painstaking coach corrects his pupils' Latin exercises! Mr. Dynevor, anxious to

give satisfaction all round, marries Miss Jarvis, for whom he has repeatedly told every one who would listen to him that he cares nothing. On finding out the forgery, he takes his wife to America—it would have been less unnatural if he had pretended that "private affairs called him to Kamtschatka" without his wife—and there that lady dies. Eleven years pass before Joan has a chance of saving his life, after which, with his usual obligingness, he marries her. The English of the story is fairly good, and the characters, though slight, and even in the case of Homfray slack, are tolerably well drawn.

Mr. Cooper tells us in the preface to his *Old Fashioned Stories*, that "all the world knows he has plenty of friends, and jolly good friends too." We must confess to having been ignorant of this fact, so widely known, and indeed of the life and adventures of Mr. Cooper, who appears to have been the protomartyr of Christian Socialism. But we think that his circle of friends is likely to be increased by this republication of tales written in 1842. Their subjects are drawn from the lives of stockingers, fishers, provincial poets, and they are told in a very manly fashion. The language is a little too fine for the characters, but it is better than the barbarous jargon so often printed to represent local dialects. The hard times Mr. Cooper writes of have perhaps gone by, but the logical despair of his starving stocking-weavers does not cease to be in season, even when people have ducks and port wine for breakfast. And there is no such great necessity to apologise for it, as there may have been in 1842.

A. LANG.

CURRENT LITERATURE.

Correspondence of William Ellery Channing, D.D., and Lucy Aikin, from 1826 to 1842. Edited by Anna Letitia Le Breton. (London and Edinburgh: Williams & Norgate, 1874.) Some of these letters appeared in the *Memoirs of Lucy Aikin* published ten years ago, but all those of Dr. Channing are new; and the correspondence, as a whole, is interesting in a way, and to an extent of which no selected passages could give a quite adequate idea. Miss Aikin was one of the last surviving representatives of the culture and opinions of the small but influential school of liberal Nonconformists who stood midway between the pronounced Evangelicals and the pronounced free-thinkers of the revolutionary period. Unconnected with either extreme, and as unpopular as either with the mass of what was regarded as safe, orthodox opinion, the party was condemned by its very weakness to a more than ordinary degree of intelligence and candour, while it had obvious advantages for estimating the comparative strength of the tendencies by which it was hemmed in. Such a correspondent was particularly welcome to an American who wished, like Dr. Channing, to keep pace with the social, religious, and literary movements in the mother country—not merely in their present superficial effects, but in the mixed, more or less personal details, ignorance of which so often stultifies the conclusions and calculations of the most intelligent strangers. As the acquaintance developed, and the letters became more intimate, the exchange of personal opinions and impressions encroached upon the space originally given up to rather commonplace discussion of books and problems of the day; but the *raison d'être* of the correspondence throughout is clearly that the parties to it can tell each other things that they want to know, and that their feeling about the intelligence ex-

changed is sufficiently harmonious for the exchange to be a pleasure. The letters are too long, too uniformly sober, and contain too little that is really brilliant or original for them to have seemed worth reprinting merely as letters; but the shade of historical and personal interest, which comes from their having been really worth writing, decides the question and makes them readable still. The letters are most numerous in 1831-2: the French Revolution, the Reform Bill, pauperism, the possibility of intercourse between rich and poor without injury to the independence of the latter, a point on which Miss Aikin is sceptical, having seen little good resulting from the fashion of district visiting, which she thinks was set in Evangelical circles by Mrs. Hannah More's *Coclebs*; the character of Ramshun Roy, of Dr. Priestley, Joanna Baillie's last work, Miss Martineau's first, then her Poor Law tales and her visit to America; the publication of *Philip van Artevelde*, of *Godolphin*, of which they do not guess the authorship, Carlyle's rising fame, slavery, Tractarianism; the social influence of the English aristocracy, which Dr. Channing found it as impossible as most of his countrymen not to exaggerate; the comparative beauty and delicacy of American and English girls, the books finished or projected by the writers—these and various topics of the same kind are discussed in a leisurely, natural tone; while the admirers of Dr. Channing will be interested both by the account Miss Aikin gives of the gradually increasing influence of his writings in Europe, and by his own full and confidential responses to her tentative discussions of the religious bearing of the philosophical opinions which they shared. Considering the variety of subjects touched upon, most of which were at the time matter of vehement party debate, there is singularly little narrowness or inaccuracy in Miss Aikin's reports; perhaps the intellectual tendencies of which she seems least equal to appreciate the bearing are those which might be regarded as the collateral representatives of the expiring school from which her own training was received; we mean the contemporary movements which took their start from Coleridge, and diverged along lines ending in what are now called Ritualism and Rationalism; the traditions of nonconformity made her intolerant of anything that looked like Popery, while her own laxity of dogma was reached less by way of historical criticism than by applications of eighteenth century philosophy, filtered through Priestley. One curious illustration of the difficulty the best-informed classes have of being well-informed on all points, is offered by a sentence written in 1833, when, not to multiply names, the reputations of Victor Hugo and Alfred de Musset were made: "It is remarkable that the French have no writers of any note at present except in the sciences."

Theology in the English Poets. By the Rev. Stopford A. Brooke. (London: H. S. King & Co., 1874.) Mr. Stopford Brooke does not cease to be clerical because he preaches upon poets instead of on the Bible. He dilutes and improves Cowper, Coleridge, Wordsworth, at great length, and Burns, just in the way we used to hear Isaiah treated. Still the book is not without merit. He makes a good point in showing that the victory of Coleridge's fatal listlessness of temperament was decided by his disappointment with the French Revolution; and he explains at great length from the "Prelude" how Wordsworth worked his way out of that temptation and others, and how his poetry declined when his love of order got the upper hand of his love of liberty; he does not explain how thoroughly unreal his apprehension of all wide aspects of national life was: apparently he does not feel the unreality because he shares it. This again is clerical.

Speech in Season. By the Rev. H. R. Haweis. (London: H. S. King & Co., 1874.) Mr. Haweis would wish, we suppose, to be taken seriously; and yet his talent bears a suspicious resemblance to that of mediæval jesters, who were listened to

for the utter unreserve with which they emptied out their shallow brains in public. He discourses with his congregation on the pros and cons of church-going, and the extreme wickedness of giving to beggars in the street, and is very sensible in enforcing the latest hints of physiological prudence in order to the preservation of cerebral sanity. He explains away "Christ's hard sayings" by the process of assuming that the fierce denunciations at the close of the Ministry prove the paradoxes of renunciation and quietism in the Sermon on the Mount to have been metaphors or hyperboles, and generally evinces a desire to give Christ credit for what Mr. Haweis thinks the best of his own ideas. Those ideas have received an addition since he published last. Mr. Wallace, or some other eminent man of science, has persuaded him there is something in the motley group of phenomena known to believers as spiritualism, animal magnetism, and the like, and without loss of time he proceeds to guess before his congregation at what this something may be. He would have guessed rather differently if he had mastered Dr. Carpenter's facts, which go far to prove that especially in so-called magnetic cases, whatever happens is due to the expectation of the subject of the phenomena, not to the means taken to excite the expectation; but elastic as his guesses are, it would have strained them less rather than more, to take account of these facts in his explanations of apostolical succession, baptismal regeneration, transubstantiation, answers to prayer, &c. Sometimes he is positively grotesque, as when he makes St. Peter recommend the brethren to be of one mind, lest they should break the magnetic circle; sometimes he is acute, as when he observes that the ancients may have had just as good reason for consulting fallible seers, as the moderns have for consulting fallible physicians: on the whole he is on the right track in thinking that if alleged cases of exceptional exaltation of human faculties are to be studied at all, they had better be studied by the comparative method. Still it is hardly a cheerful sign of the times, that a theologian of Mr. Haweis' calibre should have a wider and more rapid popularity than the late F. W. Robertson.

Le Général Lee, sa Vie et ses Campagnes. Par Edward Lee Childe. (Paris: Hachette et Cie., 1874.) The relationship or intimate connexion between the author and his hero, betrayed by the similarity of name, led us to open this volume in the hope of finding an actual biography of the great Confederate general, and not a mere history of his campaigns. It is, however, little more. Thirty pages out of nearly four hundred suffice for all Mr. Childe has to tell of the life and correspondence of Lee before and after the War of Secession. The meagre outline of his previous career affords nothing new, and the few letters scattered through the pages little that is interesting, except as conveying no impression of genius, hardly of talent, in the writer. The details and events of the war are described with an impartiality and absence of vituperation against the Northerners which show that the author has profited by the example of his illustrious namesake.

WE would call attention to an American translation (published by Messrs. Lee and Shepard, of Boston) of Coulanges' interesting book, *The Ancient City; a Study on the Religion, Laws, and Institutions of Greece and Rome*. The translation, by Willard Small, is from the latest French edition, and is pleasant reading. The book itself is well known; it describes the great change in ancient society, when the State ceased to be a merely religious community, in which the king was a pontiff, the magistrate a priest, the law a sacred formula, and where individual liberty was unknown; it shows how the efforts of the oppressed classes, the overthrow of the sacerdotal class, and the progress of thought, unsettled the ancient principles of human association; when law, politics, and morality became independent,

the earliest form of human society had ceased to exist.

National Education in Greece in the Fourth Century before Christ, by A. S. Wilkins, Professor of Latin at Owens College, Manchester, (Longmans), is an expansion of an essay which obtained the prize provided at Cambridge by Archdeacon Hare's friends. Its object is to set forth the popular Greek conceptions of the aims and methods of national education, the manner in which these conceptions were carried into practical effect (with their general results upon national life), and the criticisms of the popular ideas and methods of education by the great Greek thinkers of the fourth century, as well as the substitutes suggested by them. The enquiry is practically limited to Athens and Sparta, and is not limited to the fourth century, since most of our information as to Sparta relates to either earlier or later times, while the views of Plato and Aristotle take us into a much wider field of discussion. Perhaps it was impossible to really limit the essay to the subject set. We do not quite know why the author speaks, p. 33, of "Alcman and Terpischorus." Is it a misprint for Terpander or Stesichorus?

A Little History of Scotland, by M. G. J. Kinloch (with an introduction by the Bishop of Brechin) is fairly written; but as the authoress looks chiefly to the ecclesiastical aspect of the history, and only comes down to the fall of the old hierarchy, the history is not quite adequately treated. The account of the Scotch bishoprics and monasteries is more full than that in the common histories. Messrs. Edmonston and Douglas are the publishers.

The Privateer. By a Sailor. (Griffith & Farran, 1874.) The author had a strong impulse to make verses. Perhaps his fluency denotes some original faculty; but a sailor who makes verses aboard ship, with no literary friends near him, and no books, cannot be surprised if his faculty runs to seed.

Resurgens. Second Edition. By the Author of *Ich Dien*. (E. Moxon & Son, 1874.) It is curious that a second edition of fluent solemn twaddle on a sacred subject should be called for.

The Vacation. By J. S. Nairne. (Glasgow, 1874.) A good boyish echo of the *Excursion*.

Twelve Scotch Songs. By Gordon Campbell. (Whitaker, 1874.) Some of these have been sung; all might be.

Poems. By Annette F. C. Knight. (London: Henry S. King & Co., 1874.) Fairly correct, with enough feeling to be pleasant.

Muses of Mayfair. By H. Cholmondeley Pennell. (London: Chatto & Windus, 1874.) This collection differs from Mr. Locker's *Lyra Elegantiarum* in being confined to contemporary work on both sides of the Atlantic. It is rather a gain to meet with specimens of writers like J. Bailey Aldrich, H. S. Leigh, and Hamilton Aïdè, who is known as a novelist and dramatist. Perhaps there are too many extracts: it is startling to have extracts from Mr. Swinburne's *Felice* set before us as *vers de société*.

The Maid of Florence. (London: Sampson Low & Co., 1874.) The Canadian author or authoress seems to have studied Sheridan Knowles with profit. The heroine is beautiful, and hysterically inspired, first to get a certain Colonna appointed *Podestà* of Florence; then, when he jilts her to marry a Visconti, to upset his nascent tyranny by the aid of a discarded native lover.

EDITOR.

NOTES AND NEWS.

DR. SCHLIEHMANN writes to us that he has solicited and obtained from the Greek government, permission to demolish at his own expense the great square tower in the Acropolis, known as the Venetian Tower, which seems to have been built in the fourteenth century. It occupies 1,600 square feet of the Propylæa, and consists of large

square slabs of marble or common stone from various ancient monuments of the Acropolis and the theatre of Herodes Atticus; it measures eighty feet in height, and its walls are five feet thick.

By the demolition of this tower, which costs him 465*l.*, Dr. Schliemann renders a great service to science, for he brings to light the most interesting parts of the Propylaea, and is certain to find a vast number of interesting inscriptions, of which he has for three years the right of publication.

The work began on the 2nd instant, to the great delight of the Athenians; but to the grief of the thousands of owls by which the tower is inhabited. "But it is impossible," adds Dr. Schliemann, "to please every one in this world."

WE understand that the publication of the new edition of the *Encyclopaedia Britannica* may be expected to commence in the course of a few months. It appears that more than half the matter of the ninth edition will be new, the recent rapid progress of science having rendered extensive changes necessary. The portion almost ready contains articles on various branches of natural history, by Professor Huxley, Mr. A. R. Wallace, Mr. St. George Mivart, and Dr. W. C. McIntosh; on Anatomy by Professor Turner; on Anthropology by Dr. E. B. Tylor; on Archaeology by Dr. Daniel Wilson; and on Classical Archaeology by Mr. A. S. Murray, of the British Museum. The articles on Indian geography are contributed by Dr. W. W. Hunter; and amongst other geographical articles are Asia, by General Strachey; Africa, by Mr. Keith Johnston; Afghanistan, by Colonel Yule; and Alps, by Mr. John Ball. Assyrian and Egyptian history and antiquities are dealt with by Sir H. Rawlinson, Mr. Sayce, and Dr. S. Birch. In Philosophy, Professor Croom Robertson, Mr. W. Wallace, of Merton College, and Mr. James Sully are among the contributors; while Professor Sidney Colvin deals with Art and Fine Arts. Canon Venables writes on Ecclesiastical Antiquities, and Sir Travers Twiss on Ecclesiastical and International Law.

It is reported that Mr. Edmund Yates, the novelist, is editor of the new weekly paper called *The World*.

WE hear that Dr. Miklosich, one of whose works on the Gipsies was reviewed in the *ACADEMY* for June 13, will publish in October next some Gipsy stories, collected by himself at Bukowina. They will be given in the original Romani, accompanied by an interlinear Latin translation.

MR. J. R. GREEN's *History of the English People* is expected to be out next week.

MR. GEORGE HOGG has retired from the editorship of the *News-vendor*.

MANZONI has been virtually dead so long, that an Irishman might have said of him, as he could of Macready, that it was only by hearing of his death that people knew he was still alive. Attempts to draw the lion from his lair were, however, not wanting, and in his own country it is pretty well known that he gave some offence by refusing to help in the case of the Rossini Album. In 1864 a deputation waited upon him with like results, its object being to request that he would present to the Italian Parliament the *plébiscite* which was to be got up praying that the sixth centenary of Dante's birth might be kept as a national festival. The *Rivista Europea* of this July has an account of the interview of the deputation with Manzoni from the pen of Professor Suzzi, who acted as spokesman on the occasion. His reasons for refusing were in substance, "I am too old for public life, and would rather be let alone"—"quasi io non fossi più al mondo;" but he had energy enough to dispel the doubt which Professor Suzzi expressed to him in conversation whether, after all, Dante did more than create an intellectual Italy, and could fairly be considered a patriot whose aim was to deliver his country over to a foreign power.

THE Hungarian correspondent of the same journal has a really curious discovery to communicate, viz., that the archiepiscopal library of Eger possesses a MS. of the year 1407, of a Latin translation of Dante's *Divina Commedia*, and a commentary on his *Inferno*, the author of which is no less a personage than Giovanni da Serravalle, Bishop of Fermo. There is a duplicate of it in the Vatican Library, mentioned by Tiraboschi in his *Life of Dante* as probably unique. The preamble to the commentary asserts and proves the fact of Dante's close relationship with the family of Frangipani, who played a conspicuous part in the history of Hungary. There has long been a floating tradition of Dante as a student at Oxford, which may, perhaps, be delegated to a higher rank in the scale of probability since there is positive mention of it in the Eger MS. :—

"Iste auctor Dantes dedit se in juventute omnibus artibus liberalibus studens eos Paduae, Bonamiae, demum Ozonii et Parisiis, ubi fecit multos actus mirabilis intantum, quod ab aliquibus dicebatur magnus philosophus ab aliquibus magnus Theologus ab aliquibus magnus Poeta."

We give the first stanza of the *Inferno* in both the translation and in the original.

DELL' INFERNO CANTO I.

Caplum primum Inferni.

In medio itineris vite nostre
Repperi me in una silva obscura
Cuius recta via erat devia.

Heu quantum ad dicendum qualis erat est dura
Ista sylva silvestris et aspera et fortis
Que in renovatione [instead of cogitatione] renovat
pavorem.

L'Originale Italiano.

Nel mezzo del cammin di nostra vita,
Mi ritrovai per una selva oscura;
Che la diritta via era smarrita:
Ahi quanto a dir qual era, è cosa dura
Questa selva selvaggia ed aspra e forte,
Che nel pensier rinnova la paura.

MR. LEPEL GRIFFIN's late article in the *Fortnightly Review* on the present condition of the Eastern Question has made a great stir in Scandinavia, where it was at once translated in full, and widely circulated.

THE young lady who distinguished herself so much at the University of Upsala, last September, Miss Charlotta Yhlen, is now in England, whither she has come to study the hospital system in London and Edinburgh, before going to New York, where she has been invited to practise as a physician.

POLYBIBLION states that the valuable library of Cardinal Barnabo, late Prefect of Propaganda, which consisted of about 6,000 volumes, relating chiefly to the history and administration of Catholic missions, has been rescued from the hammer by the Pope. It will probably remain permanently at Propaganda College.

A PLAN is under consideration at Copenhagen to erect in Iceland a monument inscribed in Runic characters to the great collector of the Eddas, Snorre Sturlesson, who was at once the most learned, ambitious, and influential man of his age and country.

A NEW weekly paper has just been started in Paris under the title *Les Echos de l'Alsace-Lorraine*, and is under the directorship of a committee, which, among others of similar views, includes the names of Messrs. Erckmann, Chatrian, Kaempfen, Mézières, and Lorédan-Larcher.

THE Committee of the Petrarch Commemoration have published the programme of the proceedings which are to begin to-day (July 18), and from this we learn that the first steps in the coming ceremonials will be the departure from Avignon of a deputation of the "Minnesingers" to meet the delegation of French and Italian poets at Vaucluse. At 8 a.m. the heralds will ride through the town to announce the beginning of

the festival. At 9 p.m. the Minnesingers will return to Avignon, and be publicly received by the civic authorities. After the solemn elevation of the bust of Petrarch, the entire procession will march from the railway station to the Town Hall, in the midst of military music, succeeded by a general illumination, and terminated by a performance of the military bands, and a torch-light procession. On Sunday, July 19, a religious service will be celebrated in the open square before the Papal Palace, at which the civic officers, all deputations, and other representative bodies, will take part. At 4 p.m. a great historical cavalcade will represent the triumphal progress of Petrarch to the Capitol. At 9 p.m. on the same evening there will be a gala representation at the theatre and a popular festival, terminating in a general illumination, in which the Papal Palace will be illuminated by electric light. On Monday, July 20, a monster meeting of singers, composed of numerous Provençal associations, will be held at 9 a.m. At 4 p.m. a Spanish bull-fight will be exhibited. Fish-spearing on the lake will follow next in order, to be succeeded by national dances on the market places and squares of the city; and at night a monster Venetian festival on the Rhone, general illuminations, fireworks, music and other forms of entertainment, will conclude the great patriotic commemoration of Petrarch's festival.

IN spite of all the efforts made by the Emperor Alexander to extend the advantages of education to his people, the prejudices of the lower classes threaten to frustrate his schemes for their intellectual emancipation, and hitherto the unfortunate district school teachers find themselves met in most of the rural parishes by the systematic opposition of the entire clerical body, including the wives and families of the priests. At Mariupol a teacher has lately been clerically denounced to the entire parish as unfit to teach children owing to his habit of taking walks on the Steppe, and collecting useless grasses, disgusting insects and every conceivable abomination, and making these things objects of public instruction, while he is regarded as a dangerous innovator on account of his aversion to the use of the rod, and the good old Russian practices of pulling out lumps of hair from the heads of refractory children, and making them kneel in the snow, or on stones, according to the season, when they excite the anger of their instructors. Truly the abrogation of serfdom has made a very small step on the road of national emancipation in Russia, and progress has a hard fight to encounter before it can establish itself in the dominions of the Czar of all the Russias! Alexander's neighbour and imperial brother, the Emperor Kung-tsching, has certainly not an equally well-grounded reason for lamenting the unwillingness of his subjects to cultivate learning, if we may judge from the fact that when the young prince lately went to visit the tombs of his Mantchu ancestors, the Chinese papers announce that he found on his return to Peking as many as 7,000 scholars assembled to take part in the trying examination known as Tsun-sz, which is required from all who intend to follow the profession of teachers, or lawyers.

THE Rev. John E. B. Mayor, of St. John's College, Cambridge, has undertaken to edit, for the Extra Series of the Early English Text Society, Bishop Fisher's funeral sermons on Lady Margaret and Henry VII., with the Bishop's letters, and his Sermon preached in London when Martin Luther's books were burnt. This last sermon has never been reprinted in English. All the documents have historical value as well as philological, and Mr. Mayor will add to them an introduction, notes, and a glossary.

THE Committee of the New Shakspeare Society have resolved to alter somewhat their mode of procedure next session. The meetings of the Society are to be held once a month only, on the second Friday of every month from October to June, both included. Of these meetings one is

to be given up to a general discussion of some one play of Shakspeare's; and at the second meeting short "scratch" papers are to be read on any Shakspearean topic that any member likes to take up. All regular papers for other meetings are to be submitted beforehand, with an abstract, to a Revision Committee consisting of the Director (Mr. Furnivall), Mr. Hales, and Dr. Abbott, and at their discretion the abstract only will be printed for circulation before the reading of the paper. The reports of the discussions will be printed in abstract, as briefly as is consistent with the fair development of the speakers' views. The Society now numbers 430 members. The first part of its Transactions and the first part of its "Shakspeare Allusion Books" are promised in a fortnight. Its branches in Manchester, Edinburgh, and Bedford have had a satisfactory opening season. Among the papers promised for next session are Mr. Richard Simpson's on the Politics of Shakspeare's Historical Plays; Mr. Tom Taylor's on Ben Jonson's *Shakspearemania*; Dr. Abbott's on the First and Second Quartos of *Hamlet*; Dr. Brinsley Nicholson's on the Dates of *King John* and *The Tempest*; Mrs. F. C. N. Hall's on the Quibbles of Shakspeare; Professor Leo's Notes on, and Emendations of, Shakspeare's Text, &c.

DR. C. M. INGLEBY has finished the text of his "Centurie of Praise" (of Shakspeare), and also his Introduction to the first Part of the Shakspeare Allusion Books that he is editing for the New Shakspeare Society. During his work at the latter book, Dr. Ingleby has found that Meres, in his celebrated *Palladis Tamia*, of 1598, has quoted a line from Shakspeare's *Henry IV.*, which fact has been overlooked by all prior critics.

THE Rev. Canon Simmons's edition of the Lay Folk's Mass-Book for the Early English Text Society, will contain four texts of the poem—from manuscripts: B. the Royal MS. 17 B xvii. in the British Museum; C. (Rievaulx), MS. 155 in Corpus Christi College, Oxford; E. a MS. in the Library of Henry Yates Thompson, Esq.; F. a MS. in Caius College, Cambridge; with various readings from two other MSS.: A. Advocates' Library, Edinburgh, 19, 3, 1. art 7; D. University Library, Cambridge, Gg 31, No. 1.

DR. BRINSLEY NICHOLSON has joined the Committee of the New Shakspeare Society.

MR. DUNCAN C. DALLAS is producing, by his method of photographic engraving known as Dallastype, a reduced facsimile of the First Folio of Shakspeare's Plays (1623), in crown 8vo. The size is so very small for a double-columned book, that the new edition must prove more a curiosity than a working handbook like Mr. Lionel Booth's well-known quarto reprint. But one great convenience of Mr. Dallas's plan is, that he proposes to issue the plays separately, at two shillings apiece. The first, a double part, will be ready next December. The subscription price for the whole book is three guineas. Mr. Trübner is to publish it.

It is stated that an unpublished poem by Quevedo y Villegas, entitled *Lisipo y Policleto*, has been discovered at Madrid inside the covers of a book which had once belonged to the distinguished author. Quevedo, who flourished in the first half of the seventeenth century, was a prolific writer on serious and burlesque subjects both in prose and verse, and it will be remembered that one of his works was translated into English by Sir Roger L'Estrange.

THE following witty effusion of the poet Sir John Suckling is extracted from a letter preserved among the manuscripts of Earl de la Warr, at Knowle Park, and published in the Report of the Historical MSS. Commission. It was written at Brussels, May 5, 1630, and addressed to Mr. W. Wallis (at the Earl of Middlesex's):—

"I am come out of a country where the people are of so poor conditions that the greatest part of them would do what Judas did for half the money, and am arrived where the condition of the people is so poor

that were there an enemy to be betrayed and a Judas ready to do it, yet would there want a man to furnish out the 30 pieces of silver; where beggars and pride are as inseparable as paint to a Court ladies face, or horns to a citizen's head; where it is as rare a thing to see a man have money as in London to see a Lord Mayor have store of wit; where the inhabitants have miriads of crosses in their churches and their streets, yet want them in their purses, where the people quake if you talk of millions, and are very infidels concerning the ever coming home again of a plate fleet. In a word, in order to let you understand their state right, it is almost as poor as my description of it. This premised, you will not much wonder if I with His Majesty's bare picture only make people bow before me with as much reverence here as he himself does with his own personal presence at Whitehall, &c., &c. Coining is a forgotten art."

A CORRESPONDENT sends us the following version of the old "Hugh of Lincoln" ballad, which he heard three years ago from a little gipsy girl at Shepherd's Bush:—

"Down in merry, merry Scotland
It rained both hard and small;
Two little boys went out one day
All for to play with a ball.
They tossed it up so very, very high,
They tossed it down so low,
They tossed it into the Jew's garden
Where the flowers all do blow.
Out came one of the Jew's daughters,
Dressed in green all,
'If you come here, my pretty, pretty lad,
You shall have your ball.'
She showed him an apple as green as grass,
The next it was a fig.
The third a cherry as red as blood,
And that would tice him in.
She set him on a golden chair,
And gave him sugar sweet,
Layed him on a golden chest of drawers,
Stabbed him like a sheep."

M^{RS}. PROUDHON has written to the papers asking for the loan of any letters written by her late husband, with the object of making the volume of his correspondence, which is to appear very shortly under her editorship, as complete as possible.

THE *Nation* states that Longfellow's *Evangeline* has recently been translated into Portuguese by a Brazilian poet, Dr. Franklin Doria.

THE same journal advocates greater centralisation in the University education of the United States, in the interests alike of learning, of society, and of politics. As the tendency in this country seems at the present time to be in the contrary direction—that of the decentralisation of our Universities—the following remarks from the *Nation* will be read with interest:—

"The demands which modern culture, owing to the advance of science and research in every field, now makes on a university, in the shape of professors, books, apparatus, are so great that only the largest and wealthiest institutions can pretend to meet them, and in fact there is something very like false pretences in the promise to do so held out to poor students by many of the smaller colleges. They doubtless do a certain amount of work very creditably; but they are uncandid in saying that they give a university education, and in issuing diplomas purporting to be certificates that any such education has either been sought or received. The idea of maintaining a university for the sake of the local glory of it, is a form of folly which ought not to be associated with education in any stage. It is like buying a bad gun, which is likely to burst in your hands, because it is of native manufacture. These considerations are now felt to be so powerful in other countries that they threaten the destruction of a whole batch of universities in Italy which have come down famous and honoured from the Middle Ages and have sent out twenty generations of students, and are causing even the very best of the smaller universities in Germany, great and efficient as many of them are, to tremble for their existence."

THE deaths of two industrious historical writers, Agnes Strickland and John Heneage Jesse, have

been announced this week. Miss Strickland, the daughter of Mr. Thomas Strickland, of Reydon Hall, Suffolk, was born about the year 1806. Her historical tastes first displayed themselves in a poetical form, by the production, before the age of sixteen, of two pieces, "The Red Rose," and "Worcester Field, or the Cavalier," whose titles sufficiently indicate their subjects. The best fruits of her graver studies in history are the *Lives of the Queens of England*, and the *Lives of the Queens of Scotland*; in the compilation of these she was aided by her sister Elizabeth. The life of Mary Queen of Scots, in the latter series, was drawn with great elaboration and minuteness of detail, and it is well known how strenuous an advocate she was for the innocence of her heroine. The general excellence of her literary work, and her untiring diligence were suitably acknowledged by a grant to her from the State, in 1871, of a Civil List pension of 100*l*. Mr. Jesse was the son of the eminent naturalist, Edward Jesse, and held for many years an appointment in the Admiralty. His leisure time was occupied with the compilation of various historical works, such as *Memoirs of the Court of England during the Reign of the Stuarts*, published about 1839; *George Selwyn and his Contemporaries, London and its Celebrities*, &c. Mr. Jesse's most ambitious work, *Memoirs of the Life and Reign of King George the Third*, appeared in 1867. Notwithstanding the occasional garnish of a few fragments of manuscript authority, it contains nothing substantial save what is woven out of the many published volumes of diaries and correspondence of this reign; but we gladly endorse the opinion of the writer in the *Quarterly Review* upon it that

"a more agreeable, readable, and really entertaining compilation has seldom fallen into our hands. It is a book which the reader lays down with sincere feelings of gratitude to the writer for having enabled him to while away some hours in pleasantly furnishing up his acquaintance with many a well-known, but always attractive passage of recent history, and renewing many a familiar line of thought."

MESSRS. ADAM STEVENSON & Co., of Toronto, have published vol. i. of *The Constitutional History of Canada*, by Samuel James Watson, librarian of the Legislative Assembly of Ontario.

A SOCIETY for the Publication of Texts relating to the History and Geography of the Latin East has just been formed in Paris for the purpose of publishing or re-editing texts relating to the Latin East, especially the pilgrimages to the Holy Land which are not to appear in the "Collection of the Historians of the Crusades," undertaken by the Academy of Inscriptions. The Society will give its subscribers yearly two volumes of text, and a photograph. The texts will comprise three series: 1. *Historical Series*—charters, historical letters, small unpublished chronicles, 1095–1500; unpublished plans of Crusades, 1250–1609—2. *Geographical Series*—chronological collection of pilgrimages to the Holy Land, and of descriptions of the Holy Land and of neighbouring countries; Latin texts published and unpublished from 300 A.D. to 1400; unpublished or very rare from 1400 to 1600; French, Italian, Spanish, German, and English texts, published and unpublished, to 1500, unpublished or very rare from 1500–1600; Greek, Hebrew, Slavonic, and Scandinavian texts, published and unpublished, to 1600, accompanied by a Latin version. 3. *Poetical Series*—Latin, French, and foreign poems, 1100 to 1500.

The reproductions by phototypography will include: 1. Pilgrimages to the Holy Land, broadsheets, crusading journals, &c., printed in the fifteenth and first quarter of the sixteenth centuries; 2. Documents of the same kind, which, though of later date, only exist in unique or very rare copies. A short bibliographical notice will accompany each photograph. Among the founders of the Society are MM. Anatole de Barthélemy, Léopold Delisle, Egger, de Sauley, and de Vogüé. The

subscription is, for honorary members fifty francs, and for associate subscribers fifteen francs. We hope that the ranks of this excellent Society will be swelled by many of our countrymen.

NOTES OF TRAVEL.

THE *Journal de Saint Pétersbourg* states that the Austro-Hungarian Government is engaging in active researches to discover the fate of the Austrian Polar Expedition, which left Hamburg on board the *Tegethoff* about two years ago. A well-known explorer, M. Sidorow, believes, from various evidence drawn from the state of the Arctic Ocean, that the expedition is at present at Novaia-Zemlia, about Cape Nassau, and proposes that the Russian Government should organise an expedition into those parts for the succour of Messrs. Weyprecht and Payer and their companions. M. Sidorow offers to contribute 1,000 florins towards the expenses of the expedition. Another Russian navigator, M. Starostine, adopts M. Sidorow's conclusions, offers to contribute towards the costs, and appeals to all Russian men of science, and all Russians who are interested in the knowledge of the northern parts of the empire.

FROM Tehran we learn that the exceptionally severe weather and heavy snow of last winter has heightened the price of provisions by interrupting communications. In Tehran several houses were crushed in by the snow, and 130 persons lost their lives. Banditti were profiting by the bad state of the roads, which precluded possibility of pursuit, to commit numerous depredations, and Shiraz is infested with them. A road is about to be made from Tehran to Djulfa, with a branch from Kasbin to Resht, and a tramway is also to be constructed from Tehran to Shahzada-Abdul-Azim.

News from Kuldja announces that the Russian temporary occupation of the town has had a most beneficial effect on the prosperity of the inhabitants. Commerce is flourishing, and the Taranches are voluntarily sending their children to school to learn Russian. Only two converts to Christianity have been made; but this is probably due to the strong wish of the missionaries to receive no converts whose motives might appear interested.

AN expedition of German and Scandinavian savants starts to-day from Kiel to explore the Kerguelen Islands.

THE Greek quarter of Tenedos, consisting of some 700 or 800 houses, has been consumed by fire. The fire broke out about 8 p.m., and the town would in all probability have been completely destroyed had not the crews of the British ships in harbour given their valuable assistance. The English fleet also landed a large supply of biscuits the next morning for the houseless people who had been burnt out.

THERE were several shocks of earthquake experienced at Constantinople during the close of last month, the oscillations being from east to west and north to south.

A REMARKABLE magnetic cave has, according to the *Levant Herald* of the 3rd instant, been discovered near Pine Grove, Amader county, California. Mr. Stokes, the gentleman who relates the story, gives the following account of the cave in question:—

"After journeying for a mile and a quarter through the underground passages, Mr. Stokes and his fellow-travellers found themselves in a long but rather narrow chamber, the walls of which were 'not limestone, but a yellowish-brown and black iron ore.' Upon entering this chamber, says Mr. Stokes, 'we noticed a most peculiar disturbance of the magnet, the needle constantly vibrating from side to side, and frequently whirling round for a minute at a time with a velocity which rendered it invisible. We also experienced a singular sensation—a sort of chill, appearing to

commence at the back of the neck and extending to the very tip of our fingers and toes. As we advanced in this chamber we found these singular sensations increase in intensity until they became almost unbearable.' As the travellers proceeded the walls and floor of this chamber became more magnetic; indeed inconveniently so, for one of the party who carried a hatchet had it wrested from him by a magnetic rock near which he passed, and the combined strength of four of the party was insufficient to detach it. Nor was this all, for a pocket-knife that accidentally dropped to the floor had to remain there, none of the party having sufficient strength to pick it up. Worse was in the background. One of the explorers, named Mason, had unfortunately on his feet a pair of miner's boots, the soles of which were studded with nails. Admirable as these boots would be in Great Britain for a working man to kick his wife to death with, they were worse than useless in a magnetic cave. Mason laboured on with great difficulty, until at last he found himself 'suddenly affixed to the floor and unable to move.' He was immediately pulled out of his boots by his companions, his coat was torn to pieces and used as wraps to protect his feet, and, sickened and alarmed by this incident, Mr. Stokes and his friends 'hastily retreated,' and with a feeling of intense relief emerged from this too attractive cave into the open air."

THE *Geographical Magazine* for July sums up the geographical results obtained by the mission to Kashgar, as follows:—

"There are two Karakul lakes on the plateau, the drainage from one flowing east, and from the other west. The eastward stream is the Ghiz, which, passing through the Ghiz-Dawan, becomes the Kashgar River. That flowing west joins the stream from the Ghiz Lake or Pamir Kul, and forms the Murghab River. It enters Shighnan at Bartang, and falls into the Oxus five days' journey below Kila Punja, at a place called Vamer. Shighnan (Shaghnun) has been ascertained to be perfectly independent, and is ruled over by Yusuf 'Aly Shah, who also owns Roshan, and the adjoining Pamir. The territory of Wakhan extends up to the junction of the Aktash stream with the stream flowing from Lake Karakul, and contains the great, little, and Alichur Pamirs. The true water-parting between east and west is the Kizilyart plain, belonging to the Amir of Kashgar. The Shighnan Pamir and the Kizilyart plain are inhabited by wandering Kirghiz. The other Pamirs have been abandoned of late years. From Tashkurgan to the small Karakul Lake is one day's march, from the small to the great Karakul five days, and from the great Karakul to Ush is six days' march. The Barojit Pass into Chitral is reported to be extremely easy, and open during the whole year, except about six weeks in March and April."

THE reports and returns recently sent by Consul Wilkinson from Malaga afford, as he says, ample testimony of the flourishing state of things prevailing throughout the entire range of that consular district. "So boundless are the splendid natural resources of this part of Spain, that political agitation and the revolutionary tendencies of the people, which, in any other country would be utterly ruinous to trade and enterprise of every sort, have failed to stay the onward march of these provinces in their brilliant career of commercial, industrial, and agricultural prosperity." The most remarkable feature in the progress of this province is the cultivation of the sugar-cane, and the manufacture and refining of sugar. Within the last ten or twelve years extensive tracts of irrigable land, ranging eastward and westward along the coast from Marbella to Adra, have been planted with the cane, and there are at present no fewer than seventeen large mills and refining works engaged in this important branch of industry. A new factory and plantation upon a colossal scale is now being established on the banks of the river Guadiaro, the western boundary of the Malaga consular district.

THE Cayennais will tell you, so says a recent account from the country where he dwells, and firmly believes it, that Cayenne is very healthy. He is deaf to the mournful toll-

ings of the church bells throughout the day, and is blind to the pallor of his own cheeks and of the faces he passes in the streets. The temperature, it is true, is equable, ranging from 76° to 88° throughout the year; and the fierce heat (Cayenne being in the mean centre of the region of calms that stretches across to the African Coast) is fortunately tempered by continual easterly breezes; yet this is a bad climate without doubt. Here people are taken slightly ill, and in a few days are carried off by some disease the nature of which is unknown. We are further informed that Cayenne is the most expensive place in the world; everything in the shape of beef (mutton is never seen), poultry, pork, fish, and vegetables, is dear, and of the worst description. Potatoes and onions fetch something near a shilling a pound. Bread and French wine are the only articles moderate in price. There are no hotels, and but few indifferent cafés and lodging-houses; no theatre, club, reading-room, or any place of amusement whatever.

THE July number of the *Revue des Deux Mondes* contains an able and interesting article by M. Albert Réville, who is already favourably known to the readers of the ACADEMY, on the recent Dutch Campaign in Acheen. The brochure is divided into four parts: the first treats of the geography of the island of Sumatra, the interior of which is but little known, and of its products, and describes the inhabitants, who are of the Malay type; their religion is that of Islam, corrupted however, by many Pagan superstitions. In 1811, Sumatra, with other Dutch colonies in the east, was surrendered to England, and was not returned to Holland till 1816, certain British establishments on the island being kept up till 1824, when they were finally withdrawn, and the Dutch were left in full possession. From that time to the present day the Netherlands Government has steadily pursued a policy of annexation of the native states of Sumatra, its justification in following this course being the introduction of good government, peace and prosperity where formerly anarchy and confusion reigned. The kingdom of Acheen, at the north end of the island, alone remained unmolested, its independence being in some sort guaranteed by the Treaty of 1824 between England and Holland. In 1870 this treaty was modified and the guarantee withdrawn; its withdrawal is, in the writer's opinion, the general cause of the Acheen war. The kingdom of Acheen is situated at the north-west end of Sumatra, and is about one and a half times the size of Holland. Its population is sparse in the mountain districts, but denser in the alluvial plains of the littoral; it has been variously estimated at from 50,000 to one million souls. Pepper is the chief product of the country. The capital is at the north end of the island, about ten miles from the mouth of the Acheen river, and consists of a cluster of "kampongs" or small villages grouped round the Sultan's palace; the kingdom itself, which is called "Great Acheen," consists of three provinces, oddly styled 26, 22, and 25 "Moukim." "Moukim" are cantons containing several "kampongs" or villages, and the numbers indicate the number of "Moukim," or cantons, which form each province. The 26 "Moukim" are situated between the sea and right bank of the Acheen river; the 25 on the left bank; and the 22 Moukim in the interior, this last canton extending to the mountain chain which forms the backbone of Sumatra. About an hour's march from the mouth of the river is the "Kraton," chief residence and fortress of the Sultan. The Achinese are so widely different in appearance and physique from their neighbours that most competent travellers have assigned to them a separate origin, and it is generally supposed that they are descendants of the inhabitants of Coromandel and Malabar; they have a distinct language of their own, though they use Malay for literary purposes.

The second part of this article gives a concise account of the relations between Acheen and various foreign countries, from the earliest times

of which there is any record down to the present day; while the third section traces the causes which led to the conclusion of the treaties of 1870-71 between England and Holland, having for their object the consolidation of the possessions of the former on the Gold Coast of Africa, and of the latter in Sumatra; the fulfilment of the terms of these covenants between the two countries being undoubtedly the cause of the Ashanti and Acheen campaigns. The fourth, and last, chapter describes the operations of the campaign.

PAPERS RELATING TO JOHN WILKES.

THE moment at which the authorities of the City of London are considering in what way they may most suitably celebrate the centenary of the mayoralty of John Wilkes, one of its most notable citizens, is a peculiarly appropriate one wherein to make known any new materials which exist for illustrating that citizen's life and character. The new Report of the Historical MSS. Commissioners, as we briefly recorded in our notice last week, is of special value in this respect, and we propose now to give some fuller account of the Wilkes Correspondence, in the possession of the representatives of the late Colonel Macaulay. The most interesting feature of the collection is a packet containing original letters by Junius to Wilkes, and copies of Wilkes's replies in the handwriting of the latter. All except one were printed by Woodfall; and that one shows the bitter hatred which Junius bore to the King. It is a matter of surprise that Woodfall did not print this as well; it is noted by Wilkes as having been received November 7, 1771, and runs thus:—

"Since my note of this morning, I know for certain that the Duke of Cumberland is married to Luttrell's sister. The princess Dr., and the D. of Gl. cannot live, and the odious hypocrite is *in profundis*. Now is your time to torment him with some demonstration from the City. Suppose an address from some proper number of Livermen to the Mayor for a Common hall, to consider of an Address of Congratulation—then have it debated in Common Council; think of something. You see you need not appear yourself."

From looking over the letters of Wilkes's various correspondents Mr. Horwood came to the conclusion that the general character of the writing of the Junius letters was common to that period. As points worth consideration by future disputants in this famous controversy, it may be noticed that some of the Junius letters in this collection are written on paper of a large folio size, the water mark on one half being Britannia with a trident and a lion rampant within a wooden fence, and the motto *pro patria*; and on the other half the letters G. R. under a crown, something like a feather in each side, and the whole enclosed in a circle. Others are on quarto letter paper, the watermark on two being a shield charged with a bugle and surmounted with a royal crown, and on the others only the name of the maker, *J. Portal*.

On Nov. 4, 1771, H. S. Woodfall writes to Wilkes that he has just received a note from Junius, in which is the following passage:—"I hope Mr. W. will consent to have that silly account of my Letter to the Bill of Rights contradicted."

In one of Wilkes's printed letters to the Rev. John Horne, better known as John Horne Tooke, he says: "I glory in having four large volumes of manuscript letters, many of them written by the first men of this age." Numbers of these were printed in various forms during his lifetime, chiefly with the view of keeping his name before the public. Others we became acquainted with for the first time in Mr. Horwood's abstracts of them. The following among them seem to be the most noteworthy:—

"1764, April 10. Paris. Wilkes to Charles Churchill. In it he suggests that Churchill should make use of his intimacy with Hanbury to get from him the treasure of letters from Lord Holland, Lord Chesterfield, &c., and print them in Paris. He

mentions one letter of Fox's worth 10,000*l*. He says that the French Court was outrageous against D'Eon, who had infamously betrayed them, and published the secrets of his negotiation. Says that he has begun a long letter to D'Eon on his dedication of the two volumes of the *Finances* to Lord Bute, in which he compares the Scot to the great Sully. Says that the eldest son of the Fox is there (Paris) dissipating the ill-got fleeting wealth of the father. Says that Sterne and he often meet."

There are many other letters to Churchill in this year and the preceding one. In one dated "Dover, Tuesday, July 26," Wilkes says:—

"Churchill the Bruiser! Hogarth avant. If you will join in the conspiracy I would advertize a *Critique on the works of Hogarth*; for it would be a good substratum for all our unconnected ideas of taste, humour, &c., and would shew the nakedness of H."

Edmund Burke writes from Queen Anne Street, July 4, 1766, putting aside Wilkes's offer of political assistance on the plea that his party have not yet decided on their plan of action.

The Chevalier D'Eon, alluded to above, also figures as a correspondent; thus:—

"1768, Oct. 27, Brewer Street, Golden Square.—M. D'Eon to Wilkes.—Sends him a dozen of smoked Russian tongues.—Will come in a few days to eat some with Wilkes; wishes that the tongues had the eloquence of Cicero and the delicacy of Voltaire, in order to worthily celebrate Wilkes's birthday."

John Horne (Tooke) writes a long letter from Montpellier, 1766, January 3, in which he is strong in his professions of friendship for Wilkes, and says that although a parson he is not ordained a hypocrite. True, he has suffered the infectious hand of a bishop to be waved over him. He mentions his having passed a week with Sterne at Lyons, and his intention of meeting him again at Sienna in the summer. Sheridan is at Blois by order of his Majesty, and with a pension, inventing a method to give the proper pronunciation of the English language to strangers, by means of sounds borrowed from their own. Some people might suspect that the King employed Sheridan not so much for the sake of foreigners as of his own subjects, and had permitted him to amuse himself abroad to prevent his spoiling our pronunciation at home.

Tooke is of course alluding to Thomas Sheridan, the elocutionist and lexicographer, and not his son, the great dramatist.

Dr. Dodd, the famous forger, writes the following undated letter:—

"Anything you please to send, & the more the better, on politics or any miscellaneous subjects. News, squibs, &c. &c. will be taken due care of if directed under cover for the Editor of the New Morning Post, to Mr. Cox, printer, No. 73, Great Queen Street, Lincoln's Inn Fields.—Pray don't forget the *psalm*."

There are also five letters from Lydia, the daughter of Laurence Sterne, one addressed to John Hall Stevenson, the author of *Crazy Tales*. The first and second to Wilkes are dated from Angoulême, July 22 and October 24, 1769, and the others from Gerrard Street, Soho. She and her mother earnestly solicit assistance, and that Wilkes and Stevenson should write Sterne's life. In urging Stevenson, she says that it will prove that Eugenius was the friend of York.

Belonging to a much earlier date is some correspondence with David Hume. In a letter from Edinburgh, October 8, 1754, the historian says that Wilkes's curiosity

"to see his (Hume's) History does him much honor. It will be finished in less than 2 months. Says he could not get a copy for Wilkes's amusement on the road, because Hamilton, the publisher, did not like copies to get out before publication. . . . Recommends Blacklocke, a Scotch poet, a poor tradesman's son and born blind, who by his industry had acquired Greek, Latin, and French, and had become a good general scholar. He is a very elegant correct poet. He even employs the ideas of light and colour with great propriety. Dodsley intends to reprint his

poems. With another letter, dated Oct. 16 in that year, Hume sends a copy of the History; and asks Wilkes's advice as to language: he says, Notwithstanding all the pains I have taken in the study of the English language I am still jealous of my pen.

The correspondence between Wilkes and his daughter is extensive, and in the main unpublished. It shows the great love they bore to one another. "The refinement," remarks Mr. Horwood, the inspector of these papers, "which he ought to have exhibited to all seems to have been reserved for her alone, and her father's devotion to her was known and appreciated by all his correspondents; for hardly a letter omits mention of Miss Wilkes." Almon says that she destroyed some autobiographical sketches left by her father. In the present collection two fragments of them appear, contained in two volumes, very few leaves of which are filled. The first volume has a brief statement of his parentage and schoolmasters, and his introduction to the Mead family (into which he married) at Aylesbury; the second opens in the year 1764 and ends in the autumn of 1765, and relates to his adventures with the Signorina Corradini in France and Italy. In Naples Wilkes saw and understood the liquefaction of the blood of St. Januarius; and at Geneva the laugh of Voltaire banished all regret for the fair Italian. The narrative is in the third person.

Many other interesting bits might be gathered from the report, but we can only find space for an extract from a copy, in the handwriting of Wilkes's daughter, of a letter, dated December 22, 1784, by M. le Baron de Castille, officer in the regiment of French Guards, which tells a somewhat curious story. The writer says that Wilkes

"will remember the recognition by the Pretender of his natural daughter, known at Paris as Lady Charlotte, and living at a Convent with her mother, called Countess of Alberstroff. On the 14th August last, Lady Charlotte informed him that the Prince was going to take all necessary measures to naturalise her, and giving her the title of Duchess of Albany, and the King consented that all the *actes* should be registered in Parliament, and they were, in fact, so registered on the 7th of September, as she told him by letter dated 8 of September. She adds that His Majesty has granted to her Letters Patent, enabling her to inherit all goods which the Prince her father has in France, and the right to dispose of them. She left a short time ago for Florence, where her father received her with tenderness; whose whole business seems to see her happy and settled according to her rank. Many Italian Princes have offered, and one of the brothers of the King of Sweden. Her father, who wishes to see her on a throne, presses hard for the latter. He is commissioned to write to England. The Duchess has suffered so much in her youth that she would prefer not to marry if the Court of England would make her an allowance as long as she remained single, and thus every idea of the unfortunate house of Stuart would be extinguished. The pursuit of the King of Sweden on behalf of his brother is a speculation; he hopes to make some advantage by the alliance."

FRITZ REUTER.

THE death of Fritz Reuter will be felt widely and most intensely in every part of Germany. Though he wrote in Low German, in the dialect of Mecklenburg, his poems, and still more his stories, were known everywhere; and as many a man has learnt Spanish solely for the sake of reading *Don Quixote*, thousands of Germans have made themselves familiar with Platt-Deutsch because they could not part with Reuter's writings. In England he is but little known, though a good translation of his novels would make his name at once both admired and beloved. There is, perhaps, less elevation, less tenderness, less finish in his poems than in those of the other Low German poet, Klaus Groth, but in his prose, more even than in his poetry, Fritz Reuter has shown himself a poet of genuine creative power. In blending the humorous with the deeply tragic elements of human life he has few equals, and there are some

things in nature and in man which no one has seen and read as he has. Let those who doubt it read his *Olle Kamellen* or *Ut mine Stromtid*, and they will see that in Fritz Reuter Germany has lost her Dickens.

Reuter's was a stormy life. He was born in 1810, in Mecklenburg Schwerin. He studied law at Jena in 1832, and, like every German who had a heart for his country, he was a Liberal, and joined the Burschenschaft. But Liberalism in Germany was then a more serious matter than it is now. Reuter was sent to prison, and condemned to death, simply because he felt the degradation of his country more keenly than the sovereigns and statesmen of the time, and would have wished to see the unity of Germany realised forty-five years too soon. Though the sentence of death was not carried out, he was kept in prison from 1833 to 1840. When he was amnestied in 1840, he began to support himself as a private teacher, and soon acquired literary fame by his poems and stories, all written in his native dialect. In 1864 he settled at Eisenach, his literary work securing him that independence which he valued most in life. Among those who will mourn his death most deeply are the children and grandchildren of those very sovereigns and statesmen who signed the poet's death-warrant forty-three years ago, and who supplied the true-hearted Low-German patriot with the seven years of his *Festungstid*.

CORRESPONDENCE.

ENGLISH SURNAMES.

Cambridge: July 1, 1874.

I was glad to see Mr. Robinson's letter on this subject. He is wholly in the right in proposing to get together a really trustworthy set of materials before proceeding to draw conclusions. In particular, the localisation of names, the determining of the places to which they seem most properly to belong, is a most important matter; whilst at the same time it really ought not to be a very difficult matter, if taken up with a little care and zeal. He proposes, in fact, to do for surnames pretty much what the English Dialect

Society is doing for dialectal expressions. The preliminary process is much the same as in geology, to obtain specimens carefully labelled. This work upon surnames is so closely connected with the Dialect Society's work, that it would come quite within our programme to print, from time to time, such trustworthy and carefully sifted lists as seem to be really worth the printing. If well made, even a long list will not extend beyond a few pages.

My own correspondence is too large to admit of my undertaking to receive lists, neither have I any special knowledge of the subject. But I am glad to hear from Mr. Robinson that he is prepared to receive lists from any part of England, with a view to their future revision by competent hands, and, in fact, to undertake the general duties of secretary for the Local Surname department; it being, of course, understood that correspondents will refrain from giving needless trouble. Respecting the information which should be sent to Mr. Robinson, the chief points are these. He will be glad to be informed who are the persons that take a special interest in the subject, or have made the subject, in any respect or in any district, a special study. Besides this, he will undertake to receive lists of any one of the three kinds to which he has drawn attention. These are: (1) lists of names which are peculiarly common in a certain town or village, yet not particularly common elsewhere; (2) lists of persons residing in such and such a county whose surnames are indubitably derived from a place situate within that county; and (3) lists of persons whose surnames are connected with the names of ancient owners of the soil. The most obvious sources of information are the registers and gravestones of each parish, and the most obvious persons to supply such information are the clergy, landowners, and local antiquaries, to whom, accordingly, in the first instance, we appeal. It is only by thus drawing towards one centre the labours of many, that any satisfactory result can be obtained; and we hope that all who can help in the matter will do so, at their earliest convenience. Mr. Robinson is, fortunately, able to undertake to edit the results from Herefordshire himself; for other districts help will, doubtless, be gradually forthcoming.

Let me point out that we do not ask collectors to become members of the English Dialect Society unless they please. It is most gratifying to find that efficient occasional help has been rendered by some who are not members, and who do not wish to pay the half-guinea per annum. This is just as it should be.

All communications on this subject of Local Surnames to be addressed to the Rev. C. J. Robinson, Norton Canon Vicarage, Weobley, Herefordshire. WALTER W. SKEAT.

MR. SULLY'S ESSAYS.

Morthoe, North Devon, July 7, 1874.

Mr. Sedley Taylor has, in his courteous review of my Essays, well kept in view a laudable aim of the ACADEMY, namely, the enforcing of accuracy in scientific matters. My critic has sought to show that in several instances I have misrepresented the views of other writers. With regard to Hanslick's conception of musical expression, I will confess that I owe my knowledge of it to Lotze, whose exposition (*Geschichte der Aesthetik in Deutschland*, p. 479) I have followed almost literally. May I be allowed to illustrate the difficulties of perfectly accurate representation by pointing out a curious misreading of myself by my careful critic? Mr. Taylor accuses me of misstating the views of Helmholtz, by saying that the octave is a unique interval in respect to the perceptible similarity of its tones. Without doubt this would be a notable instance of misconception, if I had really ascribed this notion to the Professor. But how came Mr. Taylor to imagine that I was giving this idea as the view of

Helmholtz, when it occurs in my own introductory analysis of musical feelings, before the name of Helmholtz has been once mentioned, and when, moreover, I have further on (note, p. 179) expressly stated that the Professor does not recognise the peculiarity which obtrudes itself on my own ear?

Had I space I think I might show that Mr. Taylor has missed my meaning on another occasion when he speaks of me as drawing "a parallel between physiological research as subsidiary to psychology, and the study of long and elaborated processes of evolution as subsidiary to physiology in its present state." I cannot see anything which would bear this interpretation.

Some inaccuracies Mr. Taylor has certainly detected, and I would cordially thank him for calling my attention to them. When I spoke of estimating changes of pitch as multiples of the semitone, I omitted to say that I was thinking of height in the abstract, as it would be estimated were there no such thing as tonality and the diatonic scale. As to my unqualified statements of technical rules (such as that relating to sequences of octaves and fifths), against which Mr. Taylor is rather severe, it seems to me that his strictures owe their force to a misconception of the scope of my essay on Musical Form. Mr. Taylor speaks of it as an attempt to expound the principles of composition in popular language. If it wears this appearance, I must have signally failed to express my real object. In writing this essay I had before me, not any rules distinctly followed out by musical art, but principles of aesthetic impression which underlie all that is valid in these rules, though they are not consciously acted upon. Hence I made but the scantiest use of scientific text-books, and referred to technical rules only in so far as they are consequences and illustrations of these mental principles. The difference between my essay and a work on harmony or counterpoint is somewhat the same as exists between a code of rules for house-building and a theory of the conditions in human life, climate, &c., which ultimately determine the shape of the structure. I failed to find in scientific treatises any satisfactory account of the grounds of the intellectual pleasures of music. I cannot flatter myself that I have discovered the real principles on which all musical structure—including the unbending regularities of Hucbald's organum, the mazy intricacies of Ockenheim's canon, the naive symmetry of Bird's variations, and the vast and elaborate developments of Beethoven's symphony—finally repose. Yet I would hope that I have done something towards giving a definite shape to the problem. The study of these principles has a peculiar importance at this present moment, if, as I believe, they are capable of supplying a *raison d'être* for independent instrumental music.

JAMES SULLY.

THE PHOENICIANS IN BRAZIL.

Liverpool: July 1, 1874.

Some weeks since the Vice-President of the Anthropological Society in London, Dr. T. Inman, of Clifton, sent me a copy of a Phœnician epigraph, alleged to have been discovered on a stone in the Empire of Brazil. I have been able to decipher that curious inscription, with the exception of a few words which—owing to the indistinct mode of copying and the similarity of several of the Phœnician characters—are quite unintelligible.

This day I saw a letter in your publication of the 13th ult., signed by Dr. S. Euting, who condemns the whole as a mere fabrication for no other reason than that of grammatical irregularities.

Without in any way asserting the genuineness of the monument, I am prepared to show that on grammatical grounds there is no cause for pronouncing upon it the verdict of a "clumsy forgery."

I. The letters of the inscription are placed near

to one another, without the slightest division between the words. There is, therefore, no necessity for reading the first word נחן—according to Dr. Euting's style—rendering it, “they have erected”—quite an anomaly—and charging the author with ignorance of the difference between הון and הון, as well as with a deficient knowledge as to the first and third person plural. The proper reading of the first three words is: נחנא בן קנען “We the sons of Canaan.” (נחנא has the Chaldaeic termination as מלכנא in the third, and חברנא in the sixth line; in בן the final vowel is omitted, as in many other ancient Phœnician epigraphs.) This rendering removes at once the difficulties with respect to the strange word נחן, as well as to the apparent grammatical errors. The whole being styled in the first person plural—commencing with *we*—the expressions נכא, נכא, we journeyed, we came, &c., are quite correct.

2. עליונים ואליונות Elionim wa-elionoth (not Alonim walonuth). If these words were translated *Supreme* (gods) and *supreme* (goddesses), as רצת עליון, “the knowledge of the Supreme” (Numbers xxiv. 16), there would be no need of charging the author with wrong spelling. Besides, the Hebrew terms for gods and goddesses would be Elohim wa-Elohoth.

3. קתם, *men*, is a more ancient word than אִישׁ; the former occurring in the Hebrew Scriptures in the absolute form, but four times, viz.: Deut. ii. 24, and iii. 6; Job xi. 3, and xxiv. 12.

4. שלשת נשים, *three women*, is quite correct, considering that נשים, though feminine, has the masculine termination. If Dr. Euting had consulted the Hebrew Bible, he would have found a quite similar divergence from the grammatical rule in Genesis vii. 13, ושלשת נשים and the three wives.

I have thus removed all the grammatical objections raised by Dr. Euting. If you will kindly insert this letter in a coming issue, I shall send you a full and verbal explanation of the whole inscription, and your learned readers may judge for themselves whether it be a forgery or not.

JACOB PRAG,

Professor of Hebrew to Queen's College.

PROCTOR'S “UNIVERSE AND COMING TRANSITS.”

2, North Road, Clapham Park: July 11, 1874.

I thank Mr. Christie for his intended gentleness: I ask for fairness only.

I have not claimed credit for arrangements of which I formerly predicted the failure. The weak point which I indicated, the paucity of southern stations, has been corrected—not, indeed, by Sir G. Airy, but by foreign astronomers.

I have not heard that Sir G. Airy has given any “version” of the change of programme for 1882. Should he assert that the change, though subsequent to my criticism, was made independently, my criticism is none the less justified.

Mr. Christie's remarks about Halley's method are singular from one so well-informed. Mr. Forbes unwisely tried to narrow “Halley's method” to the conditions which Halley (mistakenly) supposed to exist in 1761. Unfortunately for this defence, Sir G. Airy had definitely described the “method of durations” as failing totally in 1874. (Probably Mr. Forbes, a beginner in the matter, was not aware of this; in any case, I did not think his mistake worth correcting.) Sir G. Airy has elsewhere repeatedly used the name “Halley's method” in the usual convenient sense, adopted by Herschel and by every astronomer who has dealt with the subject. Mr. Christie says I have “no authority whatever” for saying the method is to be used at selected stations. I have Sir G. Airy's statement to that effect, in a letter written to me almost immediately after Mr. Goschen had (through misapprehension) asserted the contrary. Of course

ingress and egress will (also) be worked up by Delisle's method. Indeed, I originally pointed out the possibility of this. For instance, whereas there is not one word as to the observation of egress at Kerguelen and Crozet in Airy's original programme, I had already, in June, 1869, tabulated the coefficient of parallax for egress at these and a score of other stations, half of which had before been overlooked.

In fact, Mr. Christie placidly ignores the circumstance that more than half of my original criticisms related to the qualities of Delislean stations. Thus I showed the real value of Crozet for “retarded ingress.” (Sir G. Airy had set the sun five degrees too low!) I also noted the entire omission of North India for “retarded egress,” and Mr. Christie's triumphant statement that Delisle's method is to be applied there, shows he cannot have read my paper of June, 1869, in which I advocated that very course, the possibility of which had before been completely overlooked. To suppose, however, as Mr. Christie seems to imply, that duration would not also be observed, would be to insult Sir G. Airy.

I have had no difficulty in obtaining information as to foreign arrangements. On the contrary, facts are known to me which are not at all likely to be suspected at Greenwich. Of course foreign astronomers do not forget that (as I pointed out in 1869) all first-class Halleyan are good Delislean stations. One assertion of Mr. Christie's, and one only, is news to me. I sincerely trust he is mistaken in saying that Sir G. Airy recommended America to occupy Crozet. In the summer of 1872 I repeated in a letter to Sir G. Airy my suggestion that Crozet ought to be occupied as a Delislean (as well as Halleyan) station, and in his reply he expressed a somewhat brusque dissent; he also, before the Astronomical Society last November, opposed Crozet as dangerous and inconvenient. Surely, then, Mr. Christie must be mistaken. Much as I value Sir G. Airy's assent to my views, I should be sorry indeed to see it indicated in such a way. No Englishman would recommend another nation to undertake what he had described publicly as too difficult for his own.

I unhesitatingly reject Mr. Christie's criterion for Halleyan stations, preferring Sir G. Airy's.

And now let me close, so far as I am concerned, a discussion which was, I think, needlessly originated by “gentle” but significant insinuations against my own perfectly moderate statement of facts. I quote in conclusion the latest expression of opinion about my results, the verdict of an unprejudiced and competent judge. M. Dubois, Naval Examiner for Hydrography in France, after presenting in five tables the latest estimates of the values of the chief stations, both Halleyan and Delislean, quotes at great length my own calculations and resulting tables (published in 1869), with this comment: “Disons que ces tableaux s'accordent entièrement avec ceux que nous avons donnés.”

RICHARD A. PROCTOR.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, July 18,	3 p.m.	Crystal Palace Summer Concert (Humorous Music).
	8 p.m.	Madame Fargueil in <i>Nos Intimes</i> at the Queen's Theatre.
FRIDAY, July 24,	8 p.m.	Quekett Club: Anniversary.

AMONG Mr. Murray's forthcoming works we notice the *Last Journals of David Livingstone*; vol. v. of the *Speaker's Commentary*, containing the Four Great Prophets; a *Memoir of Sir Roderick I. Murchison*, based upon his journals and letters, by Professor Archibald Geikie; the authorised translation of Dr. Schliemann's *Trojan Antiquities*; a work on the Nicene and Apostles' Creeds, &c., by Canon Swainson; *Lectures on the Early History of Institutions*, by Sir H. Sumner Maine; the third volume of the Rev. Whitwell Elwin's edition of Pope; and the late Dean Mansel's *Lectures on the Gnostic Heresies of the First and Second Centuries*.

SCIENCE.

Kant's Critical Philosophy for English Readers. By John P. Mahaffy, M.A., Fellow and Tutor, Professor of Ancient History in the University of Dublin. Vol. I. Parts II. and III. (London: Longmans & Co., 1874.)

SINCE Mr. Mahaffy's Commentary was reviewed by Mr. Sidgwick in the ACADEMY, (vol. iii. No. 56), two parts have been published, containing an exposition of the whole of the Transcendental Analytic—that is, of the most difficult part of Kant's Philosophy. With some deductions to be afterwards mentioned, the hard task has been accomplished in a very satisfactory manner. In fact, I doubt whether Kant could be made much clearer by any one who was so absolutely a disciple of Kant as Mr. Mahaffy. As a commentator his defect is the reverse of the usual one. He has identified himself with his author so closely, as scarcely to be able to criticise him, or even to give that kind of illustration to his subject which comes of seeing it from a fresh point of view.

The main difficulty of Kant arises from his position as a discoverer between the living and the dead philosophies. He painfully opened up the way into what was almost entirely a new region of thought; but he was never able quite to free himself from the conceptions with which he started. His mere language is full of contradictions, because he uses words sometimes in the sense in which they had been used by previous philosophers, and at other times in some new sense which he is endeavouring to gain for them. “Perception,” “Experience,” “Object,” and many other terms, enter into Kant's philosophy with one meaning, and come out with another. Kant accepts all the conceptions of the popular philosophy as a provisional basis for thought, but, beneath his close inspection, they gradually become transfigured. This characteristic, while it immensely adds to the educational value of the study of Kant, making it, like the study of Plato, a gradual elevation of the student from the plane of popular conceptions to the region of speculation, increases the difficulty of the expositor, and renders it very hard for him to give a precise meaning to passages in which the new and the old are almost inextricably interwoven.

Another difficulty that arises out of this, is that in his *Criticism of Pure Reason* Kant really inverts the order of thought, and thereby is forced to speak at the outset in a way that he is forced afterwards to correct. In the “Aesthetic,” perception and conception appear as distinct things. The one is the apprehension of the Individual, the other of the abstract Universal. In this sense the distinction is drawn between time and space, as individual objects of perception, and the conceptions of the understanding. But when we advance to the “Analytic,” we learn that in this sense perception presupposes conception, and apart from conception gives us no apprehension of the object as such. Perception, we there learn, is not of one object, nor even of the manifold of sense as manifold, except through the synthesis of the understanding. It is some-

thing that apart from thought is for us as good as nothing.

A similar difficulty meets us in the progress of the "Analytic." Mr. Mahaffy, after explaining the passage in which Kant says that "thinking is judging," and that conceptions are useful to us only in so far as we can apply them to objects through perception, quotes a remark of Mr. Malet's, the importance of which he does not seem to see. Mr. Malet says that "the binding up of intuitions under conceptions produces integral wholes; while the binding up of conceptions in judgments, produces universal wholes" (p. 193). This really indicates what is the great difficulty in following out Kant's reasoning and his attempted assimilation of the analytic and synthetic judgment. The whole exposition, especially where Kant speaks of conceptions as being "referred to objects through perception," suggests to us the idea that perceptions form the subjects of propositions to which the pure conceptions are related as predicates. Really, however, as we gradually discover in the sequel, the truth would be more accurately expressed by saying just the reverse of this. The categories are general conceptions of objects, and it is only as predicates of such pure conceptions that the perceptions become intelligible. The intellectual synthesis is presupposed in the imaginative synthesis, which itself again is presupposed in the apprehension of empirical objects. It is true that Kant tells us that the intellectual synthesis has no objective meaning apart from the empirically given manifold; but, on the other hand, the manifold of sense has no meaning at all apart from the intellectual synthesis. In the curious see-saw of the Kantian dualism we may equally say that perceptions give objects to conceptions, and that conceptions make perceptions objective. But the "emptiness" of the conceptions in themselves should be distinguished from the "blindness" of the perceptions in themselves, and therefore the latter seems the preferable form of expression. The same inversion of the real relation of conception and perception is again suggested by what Kant says of judgment in its ordinary and in its transcendental sense; for the analogy leads us to think of objects given apart from the application of a rule under which they are afterwards brought; while the truth is, that it is through the application of the rule that experience or knowledge of these objects becomes possible. Mr. Mahaffy understands Kant too well to overlook this distinction, but he nowhere states it with sufficient clearness. In what follows, I shall select one or two points on which his exposition seems to me open to objection.

1. In p. 217, Mr. Mahaffy speaks of the difference between the first edition of the *Kritik* and the *Prolegomena*, in regard to the deduction of the Categories, in language that seems to me misleading.

"I have already called attention," he says, "to the two-fold character of the Categories, which are both general concepts, or frames of objects of intuition, and also pure general forms of judgments; our intuitions are, as Kant says, determined by these Categories, in relation to some one of the pure forms of judgments. The deduction of the Categories need therefore only establish

their objective necessity in either of these relations, and the other will necessarily follow. For when we speak of the Categories being necessary for our experience, what do we mean by experience? We mean a great complex, embracing a vast number of objects, and we mean also the legitimate and orderly connexion of these objects into a great harmony or unity. This connexion of objects, which implies certain necessary relations among them, can only be expressed or conceived in judgments concerning objects. If the Categories are necessary for the formation of the judgments of experience, it is clear that they must also be necessary for the objects of these judgments, since nothing can be for us an object unless it be either the subject or predicate of some judgment. The necessary laws, therefore, of the connexion of objects must hold good of these objects themselves. Such an inquiry Kant calls a deduction of the possibility of (the faculty of) experience, as contrasted with a deduction of the possibility of the objects of experience. The latter side of the deduction had been brought forward prominently in the first edition, and it is only in the two summaries of the discussion that he notices the power of the understanding to make laws for nature, in fact, to establish necessary connexions among the objects of our experience. This latter is then the aspect of the Categories which he takes up in his *Prolegomena*" (pp. 217-19).

Mr. Mahaffy here seems to mistake the meaning of a passage in the *Prolegomena* (§ 17). Kant does not contrast the apprehension of objects with the apprehension of the connexion of objects; he simply contrasts the subjective and objective ways of stating our *a priori* knowledge of both. It is equally correct for me to say that I know *a priori* that it is impossible to make a judgment of experience, except in relation to objects of which the law of causality holds good, and to say that I know *a priori* that empirical objects fall under that law. But the former statement is to be preferred, for it is less apt to lead to the mistaken idea that the objects of experience are known as things in themselves. The question is merely one in relation to the best "formula," or mode of expression, not, as Mr. Mahaffy would have it, in relation to the method of treating the subject.

There is indeed a certain difference of the *Prolegomena* and second edition of the *Kritik* from the first edition, which might at first sight seem to justify Mr. Mahaffy's view. The examples that Kant gives in illustrating his conception of "judgments of experience" as contrasted with "judgments of perception," have to do with the connexion of objects which are supposed to be already known as objects. Thus, Kant takes the judgment "when the sun shines upon the stone it becomes warm," as a judgment of perception, which when it becomes a judgment of experience takes the form that the "sun warms the stone." But here there is no question as to the objectivity of the sun, or the warm stone, but merely as to the objectivity of the connexion between the perception of the sun and the perception of warmth in the stone. So long as this objective connexion is not ascertained, that is, so long as the sun is not conceived as the cause of warmth, we have merely a judgment of perception and not of experience; but it is obvious that such a judgment of perception presupposes other judgments of experience by which the manifold of per-

ception in the sun was combined into the unity of one object, and so also with the stone. It is a difficulty in the understanding of Kant that he does not call attention to such previous and pre-supposed judgments of experience; and the difficulty is further complicated by the fact that Kant recognises (in the deduction of the Categories, second edition of the *Kritik*, § 19) that the copula of the judgment always involves a reference to the unity of apperception, a view which, taken strictly, would be fatal to the judgment of perception altogether. There is here then a distinction between the first edition of the *Kritik* and the *Prolegomena* which is worth pointing out; but I think that Mr. Mahaffy has introduced it in the wrong place, and in a way that obscures the continuity between the judgments by which objects are constituted as such and the judgments by which they are connected with each other.

2. Mr. Mahaffy adheres to his view that Kant based his science of arithmetic on the intuition of space, though he doubtfully admits the possibility of deriving it from time. "I am still in doubt," he says, "whether similar representations repeated in time would have given the same notion of different units which we derive from co-ordinated units in space. The units in time may be the same thing reproduced: this cannot be the case with separate units in space."

In spite of the somewhat hesitating passage in the *Prolegomena* (§ 10), there is a good deal to be said for this view, especially as it is supported by a passage in the earlier Latin treatise in which Kant first published the theory of the "Aesthetic." There (§ 12) we find him saying that "pure mathematics deals with space in geometry, with time in pure mechanics; and that to these has to be added the conception of number, treated by arithmetic—a conception in itself intellectual: 'Cujus tamen aetuiatio in concreto exigit opitulantes notiones temporis et spatii, successive addendo plura et juxta se simul ponendo.'" The latter part of this passage seems exactly to correspond with the words quoted from Mr. Mahaffy. At the same time the form in which Mr. Mahaffy first stated his view, according to which we get our notion of number by having five or six units immediately presented to us in space at once, does not correspond to Kant's thought; for Kant holds that number is generated by the continuous addition of units. Space itself is known to us as an object only, as we distinguish and yet combine the moments of time in which we ideally traverse it (*Kritik*, p. 93, Rosenkranz edition).

3. There is a subject which Mr. Mahaffy has specially made his own, namely, the defence of Kant against the charge made by Schopenhauer and others, that in the second edition he recoiled from the idealistic position taken up in the first. In the section devoted to this subject (chap. xv.), Mr. Mahaffy makes out quite successfully, as it seems to us, that Kant never dreamt of such a thing as the apprehension of things in themselves in space, i.e., that he never directly confused external things in space, with external things in the transcendental sense which he so clearly dis-

tinguishes therefrom in the criticism on the first Paralogism. At the same time, Kant's language seems *indirectly* to lead to such a confusion, and as Mr. Mahaffy while doing Kant more than justice in this direction, seems to do him less than justice in relation to his knowledge of Berkeley, a few remarks on the subject may be necessary.

Kant has two Idealisms before him, the problematical Idealism of Descartes, and the dogmatic Idealism of Berkeley. The latter he conceives to be produced by the contradictions involved in the notions of extended matter in itself and of space as (in Berkeley's language) "something besides God which is eternal, uncreated, infinite, indivisible, immutable," and he argues that this Idealism would logically turn all objective existence into illusion, or could only escape from this consequence by becoming "*schwärmerisch*," *i.e.*, basing objective assertions upon mere conceptions without perceptions. Berkeley confused the assertion that external phenomena are not things in themselves with the assertion that there are no things in themselves; and, on the other hand, he could find no ground for distinguishing phenomena in time and space from illusions and dreams. The Cartesian Idealism, again, did not reduce external phenomena to illusions, but it reduced them to doubtful inferences. It rested on the presupposition that we know ourselves and our own conscious states *immediately*, but everything else *mediately* by an inference from effect to cause, and such inference of course always leaves doubt possible, both as to the existence of the cause, and the qualities attributed to it. This argument Kant meets in the first edition by pointing out that the difficulty really arises from our thinking of external things as if they were things in themselves. If we realize that they are merely phenomena, we will see at once that they are equally relative to consciousness, equally immediate with the phenomena of our inner life. In the second edition he adds that the consciousness of the phenomena of the inner life presupposes the consciousness of external phenomena, for only externally in space can there be presented to us an object with the quality of solidity that preserves its identity as extended through all changes, and which may therefore be subsumed under the Category of Substance. The consciousness of our own phenomenal self with its continually changing states as an object determined in time, is only secondary. Now, this conception of Kant at first seems to have much plausibility, which, however, disappears on closer inspection.

The view that underlies the whole Analytic of Kant is that sense in itself gives us only difference, and that the intelligence in itself is a bare identity or unit. The only possibility of knowledge is that the difference of sense and the identity of thought should be brought together, and reflected on each other. "Thoughts without perceptions are empty; perceptions without thoughts are blind." It is the first presupposition of Kant, in fact, that the intellect has in itself no possibility of differentiation, and sense in itself no possibility of integration. But both are necessary for knowledge; for the mere

identity of thought can have no consciousness even of itself except in relation to a given difference, and the mere difference of sense cannot be known as a difference or 'manifold' except in relation to an identity. If we attempt to conceive either element by itself, we immediately find that it presupposes and refers to the other.

Now, if we take this difference or "manifold of sense" in the first and simplest form in which we can apprehend it, we have the conception of matter in space or extended matter, which is the extreme opposite of the simplicity of the self. Matter in space is absolutely self-external; we can never find an absolutely simple unit in it, for every space is made up of spaces and in space. Nothing, therefore, can be presented to us in space which is not manifold or different in itself, and which does not stand in relation to other things different from itself. On the other hand, the ego is conceived as an absolute simple unit, so simple and individual that it cannot even be conscious of itself except in relation to an externally given manifold. To mediate between these two opposites, and make knowledge possible, we have on the side of the self the categories, and on the side of extended matter the sensuous form of time. For the manifold matter whose essential characteristic is to be in space, *i.e.* never to be simple or single, cannot be *directly* brought in relation to a self whose essential characteristic is to be always and absolutely simple. It can only be brought in relation to such a self in succession under the form of time. On the other hand, in order that this successively given manifold may be conceived as in space, it must be synthetically united. For there can be no knowledge of objects as in space, or of space itself as an object, by an absolutely simple self, unless the matter given separately in time is brought together under one conception, and so in one consciousness. And it is to produce this synthetic unity in the manifold that the ego is supplied with categories.

Thus, then, the same synthetic movement of thought by which the conception of the external object in space is realised, realises also the consciousness of self as the same self in different times and states. And the internal and external experiences are correlative with each other. The identity of the self, in spite of the differences of the manifold which is presented to it, and the permanent difference or manifoldness of the external object in spite of the identity of the consciousness in which it is presented, imply and presuppose each other. If we try to think of a self in successive states, that does not refer these states to a permanent object, we see that such a self could never become conscious of its own identity. If, on the other hand, we try to think of an object or a world existing in difference and manifoldness apart from any synthetic unity produced in that manifold by the self to which it is successively presented, we see that such an object or world could not be known. But Kant does not clearly apprehend this correlative of the two elements of experience, and therefore he alternately makes the outer the presupposition of the inner life, and the inner the presupposition of the outer. When

he is explaining how the manifold of sense becomes for us an intelligible world of objects, he speaks of our apprehending it in relation to a permanent consciousness of self; but when he comes to consider the consciousness of self as involving the determination of manifold successive states as belonging to one consciousness, he tells us that such determination presupposes the experience of permanent external objects. Nor can we get out of this difficulty, as Mr. Mahaffy seems inclined to do, by saying that it is only the phenomenal self, the determination of which is regarded by Kant as subsequent to the knowledge of permanent external objects. For the bare logical ego is a mere form of consciousness in general, and the actual consciousness of self is always, on Kant's principles, consciousness of the phenomenal self. If, indeed, Kant had said that inner and outer, self and not-self, are correlatives, and that we can give no determination of the one apart from the other, and that the "unity of apperception" transcends the difference, the difficulty would have disappeared. But this solution, when it occurs to him in the notion of a "perception or intuitive understanding," Kant deliberately rejects. Instead of this, he identifies or confuses this transcendental unity of apperception, which transcends the difference and brings its terms together, with the abstraction of self, which, of course, is the correlative opposite of the not-self. Or, in other words, he makes one of the factors of knowledge the principle of its own connexion with the other factor. That other factor, therefore, necessarily takes up the place of a "thing in itself" or absolute presupposition. Kant, in fact, mixes together absolute Idealism and absolute Dualism, and holds at once that experience consists of two factors which are included in no higher unity, and *at the same time* that these factors are only known in relation to each other, *i.e.* as included in a higher unity.

Hence there is, after all, some justification for those who took Kant's refutation of Idealism as asserting the existence of things in themselves in space. For the same dualistic presuppositions which, in the first edition, made Kant oppose the things in themselves to experience and consciousness, in the second edition led him to treat external phenomena not as correlative with but as presupposed by internal phenomena. For, as he confused the consciousness of the individual self as distinguished from and opposed to the external world, with the unity of thought that transcends the difference of self and not-self, he could not consider the former as the correlative opposite of the consciousness of objects in space. Thus spatially determined objects are again thrust out of the unity of thought in which they had been included, and become necessary presuppositions without which that unity cannot be realised. And indirectly, Kant's view appears to involve the absurdity of "external things in themselves," however he might refuse to admit such a notion when directly presented to him. EDWARD CAIRD.

THE remainder of the engravings of Sir E. Landseer are to be sold by auction on Tuesday the 28th instant.

NEW EDITION OF THE SCHOLIA ON THE ILIAD.

It is understood that a new edition of the Scholia on the *Iliad*—a work long and anxiously expected by Homeric scholars—is about to be published at the Clarendon Press of the University of Oxford, under the editorship of Professor W. Dindorf. The first volume will contain the Scholia of the famous manuscript of the Bibliotheca Marciana at Venice, the *Codex Venetus*, and will probably be issued in the course of the present year. It is intended that the work shall consist of four volumes, 8vo.

The first publication of these Scholia by the French scholar Villoison (*Homeri Ilias ad veteris Codicis Veneti fidem recensita. Scholia in eam antiquissima ex eodem Codice aliisque nunc primum edidit cum Asteriscis Obeliscis aliisque signis criticis* Joh. Baptista Caspar D'Anse de Villoison, &c. *Venetii, typis et sumptibus fratrum Coleti*, 1788) may be said without exaggeration to have made an era in philology. It formed the basis of the labours of Wolf, and through him gave the impulse to the critical scholarship of the present century. Wolf was the first to proclaim the unique importance of the Venetian Scholia, both for the text of Homer and for the whole body of ancient criticism. He speaks of it as "ea Scholiorum congeries, quae antiquarum et ad horum Carminum fata et textus conditionem perspicendam utilium rerum copiam multo majorem, quam ceteri in unum collati libri omnes, suppeditat, atque omnino criticis et grammaticis divitiis non Eustathio, sed omnibus omnium poetarum Scholiastis longe antecellit" (Prolegomena IV.). Unfortunately Villoison's edition was defective in several respects, not entirely through his fault. His printer, Coleti, was notoriously inaccurate, and Villoison trusted too much to him. The Greek was printed without the accents, although a large proportion of the Scholia deal with the rules of accentuation. The letters A, B and L, which were used to distinguish the different manuscripts from which the Scholia were taken, were frequently omitted or interchanged. The Lemmata, which often differ from the text, were inserted or omitted almost at random. But perhaps the most serious defect was the neglect to distinguish between the different sets of Scholia in Codex A. The text, it should be explained, is placed on each page in such a manner as to leave a space for Scholia on three sides, viz., above, beneath, and on the outer margin. On this space accordingly most of the existing Scholia are written, and are evidently part of the original plan of the work. German scholars call them the *Randscholien*: no English scholar has yet had occasion to seek for a suitable term. But between the text and these *Randscholien*, and again on the narrow inner margin, are placed a number of short Scholia, evidently added afterwards wherever room could be found. These Scholia—called by the Germans the *Zwischenscholien*—stand to the *Randscholien* in a relation which has not been investigated, the first need for such an investigation being a new edition with a proper separation of the two classes. It is clear, however, that the bulk of the *Zwischenscholien* come from the same original as the *Randscholien*, namely, the Alexandrian grammarians, and that they contain in a shorter compass at least as great an amount of valuable matter. They frequently repeat in an abridged form the substance of the longer *Randscholien*; in such cases Villoison usually omitted the shorter Scholium altogether, and thus destroyed the indications which might otherwise have shown to scholars that they had to do with two distinct streams of information. The second and only other edition of the Scholia is that of Bekker (*Berolini*, 1825). It might have been expected that a critic of Bekker's eminence would not have failed to put scholars in possession of these valuable documents in a satisfactory form. This, however, has not proved to be the case. Attention was first called to the defects of the edition in a paper by W. G. Pluygers (*De retractanda Carminum Homericorum editione*, &c.,

Leyden, 1847). The materials of that paper were derived from a fresh examination of Codex A, made by Cobet, and a new edition by him was then promised. This intention, however, was afterwards abandoned, and Cobet's manuscripts were acquired by the Delegates of the Clarendon Press, and form part of the materials at the disposal of Professor Dindorf for the new work. The importance of the distinction between the two classes of Scholia in Codex A seems to have been first pointed out by Professor La Roche, in his useful work *Text Zeichen und Scholien des berühmten Codex Venetus zur Ilias* (Wiesbaden, 1862), in which he insisted, with fresh examples and arguments "dass eine neue Ausgabe der Scholien nicht nur wünschenswerth sondern unumgänglich nothwendig ist" (p. 17).

Some of the preceding facts were referred to in an article which appeared in the first number of this journal, a review of the *Iliad* of M. Alexis Pierron. The writer of that article was engaged in the course of last winter in making a fresh collation of the Venetian Scholia, to serve as the basis of the projected Oxford edition. The result of his labours has been to show more clearly than ever the insufficiency of the two existing editions. In the course of one sheet (8 pages) of Bekker he counted twenty-eight scholia to which the letter A was subjoined, but which were not to be found in Codex A. The Lemmata, which frequently contain various readings of importance, are either omitted by Bekker, or are taken arbitrarily from the text. When two Scholia contain nearly the same matter they are usually dovetailed together into a single Scholium. The number of short Scholia thus absorbed, or altogether omitted, must amount to hundreds. This treatment would be unsatisfactory in any case, but with the Venetian Scholia it is ruinous. For it is to the exact form of the Scholia that we have to look, in order to determine their value for the settlement of the text. The Scholia profess to contain the substance of four ancient works: (1) the commentary of Aristonius explaining the critical marks of Aristarchus, (2) the work of Didymus on the recension of Aristarchus, (3) the treatise of Herodian on the accentuation, and (4) that of Nicanor on the punctuation of the *Iliad*. These authorities, however, are seldom named in the Scholia, and we are left to gather from the nature of the matter, and by comparison with other Scholia, which of them belong to each of these grammarians. Hence every inaccuracy—a *σ* or a *ο* added or left out—is the loss of a link in the chain of evidence by which we go back to the text of Aristarchus, that is to say, to the best learning of the third century B.C.—1200 years before the best of our existing manuscripts was written.

D. B. MONRO.

NOTICES OF RECENT SCIENTIFIC BOOKS.

Elements of Physical Manipulation. By Edward C. Pickering, Thayer Professor of Physics in the Massachusetts Institute of Technology. Part I. (London: Macmillan & Co., 1874.) A few years ago there was scarcely a physical laboratory in Great Britain. King's College, London, possessed one, as also did the University of Glasgow, but they were not general. We meet with them more often now, both in our universities and in some of our public schools. Chemical laboratories were common enough before physical laboratories were thought of. In the former, experiments are made in order to determine the nature and properties of bodies, the way in which they combine, and their internal constitution; in the latter, on the other hand, force rather than matter is studied. Electric and magnetic measurements are made, and instruments for illustrating the properties of light, heat, cohesion, &c., are made and tested. The work before us will be found of great use in physical laboratories. It gives minute directions for performing various experiments in an exact manner. We have at the

commencement an account of general methods of investigation, and the statements of results both by the analytical and the graphical methods. This is followed by a description of a number of general experiments, such as testing thermometers, calibrating by means of mercury, estimation of tenths of a second, ruling scales, &c. Then we have various physical manipulations connected with the mechanics of solids, liquids, and gases, sound and light. Heat and electricity are to follow in another volume. The book is so good that we are sorry to see it badly illustrated. We hope for the second edition a set of blocks will be cut for it similar to those we find in Bunsen's *Gasometry*, or Guillemin's *Phénomènes de la Physique*. Meanwhile we commend the book to all students of physical science. It contains matter which they will search for in vain in the usual text-books.

Annual Record of Science and Industry for 1873. Edited by Spencer F. Baird, with the assistance of eminent men of science. (New York: Harper & Brothers, 1874.) This work corresponds to the German *Jahresberichte*, Figuier's *L'Année Scientifique et Industrielle*, and in our own country to Timbs's *Year Book of Facts*. It is, however, more comprehensive than any of these, and forms a volume of over 700 pages. The more detailed and individual account of the various results obtained during the year is preceded by a very useful and interesting "general summary of progress," which occupies more than 100 pages. Then follow the various sciences in order: mathematics, astronomy, terrestrial physics, meteorology, physics, chemistry and metallurgy, mineralogy and geology, geography, explorations and researches, natural history, zoology, anatomy and physiology, botany and vegetable physiology, agriculture and rural economy, pisciculture and fisheries, domestic and household economy, mechanics and engineering, technology, materia medica, therapeutics, and hygiene. At the end of all is a list of the various works consulted in the preparation of the volume, and an obituary of scientific men. Although the past year was not marked by any very notable discovery, we cannot, looking at the number of results in this volume, say that men of science have been idle, or that the year has been unfruitful. The *Annual Record* gives us a very fair insight into the nature of the scientific progress of the year, and each lover of science will find the most recent results obtained in his special subject of study.

Qualitative Chemical Analysis and Laboratory Practice. By T. E. Thorpe, Ph.D., F.R.S.E., Professor of Chemistry in the Andersonian Institution, Glasgow; and M. M. Pattison Muir, F.R.S.E. (London: Longmans, Green & Co., 1874.) This work constitutes one of the newest of the series of text-books of Science edited by Messrs. Goodeve and Merrifield. It is divided into two parts, in the first of which the student is made acquainted with the principal properties of the non-metallic elements; while in the second we find in a very concise form the principal operations by which bodies may be separated from each other, and their specific nature determined. As there is already in this series Dr. Miller's *Inorganic Chemistry*, in which the preparation and properties of the non-metallic elements are minutely described, it was unnecessary, we think, to occupy more than one-third of the book with similar matter. At the same time it should be added that this part is more experimental, and more precise in its directions concerning experiments than Dr. Miller's book. The qualitative analysis commences with an account of flame reactions, the use of the blowpipe and of the spectroscope being respectively minutely described. This is followed by the reaction of the bases, among which are included such comparatively rare bodies as cadmium, chromium, and nickel, while really rare bodies, as vanadium, molybdenum, and uranium, are omitted. The reactions of the principal acids, organic and inorganic, are next given; and

then a series of tables, giving a synopsis of analytical methods, and of great utility to the student. A short section is given to the detection of some of the rare elements, and the remainder of the book to medical chemistry—the detection of poisons, including arsenic, phosphorus, the organic acids, and the alkaloids. Altogether the book is very complete for its size, and it will supply a want which is often felt.

Handbook of Natural Philosophy. By Dionysius Lardner, D.C.L. Hydrostatics and Pneumatics. New edition: edited, and the greater part rewritten, by Benjamin Loewy, F.R.A.S. (London: Lockwood & Co., 1874.) Dr. Lardner's capital series of manuals is well known to the student of science. They are a little antiquated now, but in spite of that we often turn to them for things that we cannot find elsewhere. They were founded to a great extent upon Pouillet's *Éléments de Physique*, and sometimes followed this work almost too closely for anything but an avowed translation. The books were always clear and concise, and we are very glad to see that new editions under the editorship of Professor G. C. Foster and Mr. Loewy are appearing. We should like in course of time to see new illustrations introduced; some of the blocks are a good deal worn, and many of them rough, and out of proportion. We should like to see the book illustrated after the manner of Privat-Deschanel or Guillemin. In this present volume we find an account of the principal properties of liquids and gases. We think it would have been preferable, according to common usage, to have placed hydrodynamics by itself, with a heading of its own, instead of including it with moving gases, under the general title of "The Motion of Liquids and Gases." We also think that the molecular theory of gases might have been discussed. We notice, however, in the main, that recent results have been introduced, and that obsolete matter has been expunged in many instances. The work will, we are sure, find a numerous class of readers.

G. F. RODWELL.

THE COMET.

ACCOUNTS of this interesting object come in from all quarters, and certainly it is deserving of all the attention it receives; for though inferior as a spectacle to some former comets, and notably to that of 1858, it is likely to play a far more prominent part in the advance of science, from the superior means of attack now available for entering on the question of the physical constitution of these strange bodies.

The first question that naturally presents itself is, whether this comet has ever visited us before, and will ever visit us again. As far as observations go at present, it appears from Mr. Hind's computations that this must be answered in the negative, for the deviation from a parabolic orbit is insensible, so that it is not at all likely that we are now witnessing the return of the comet observed by the Jesuits in China, in 1737 (although the path of that comet was very similar to that of our present visitor), unless, indeed, it has experienced considerable perturbations, a contingency never to be lost sight of with such a disturbing element as Jupiter in the solar system. Besides, it must be remembered that, though the arc described about the sun since its discovery is 90°, yet the apparent motion has been some 25° only, so that any error of observation will be considerably multiplied in the heliocentric orbit.

In the telescope the appearances presented have been sufficiently curious: at first a luminous fan was seen on each side of the nucleus, and I have since observed with the Greenwich Equatorial a very beautiful arrangement of brushes of light, forming a parabolic arch round the nucleus, with two other parabolas farther off, intersecting in the axis of symmetry, and presenting somewhat the appearance of gothic tracery.

But the memorable fact about this comet is that it is the first of any size to which the spectroscopic

has been applied. M. Rayet first pointed out that the nucleus gave a continuous spectrum, and M. d'Arrest found that this was interrupted by dark absorption lines, a fact which I noted independently; these dark lines seem to break up the red end of the spectrum into bands and also occur in other parts, but I have not succeeded in fixing their position with any certainty. Another point which I have noticed is that there appear to be numerous bright bands like knots of light on the continuous spectrum; this requires confirmation.

With regard to the coma, Mr. Huggins finds three bands coincident with those of olefiant gas (due to carbon); I have only made certain of two of these, but have satisfied myself of their sensible coincidence with two of the bands exhibited when an induction spark (without Leyden jar) is sent through rarefied carbonic acid gas. The spectrum of the latter is, under these circumstances, very similar to that of the coma, being continuous, with nebulous bands brighter than the background; but, of course, this does not in any way prove that the comet is composed of carbonic acid gas, the spectrum being only one of the four forms of carbon spectrum. One of the chief difficulties in determining the substance of which the comet is composed arises from this very fact of the variety in the spectra of carbon and its compounds, due possibly to the more or less intimate combination entered into between this tetravalent element and others. Carbonic acid under ordinary pressure appears to give a continuous spectrum, and this is also the case with the rarefied gas when the temperature is not very high; but when a Leyden jar is introduced into the circuit of an induction coil, and the spark passed through the gas, the spectrum changes completely, owing to the elevation of temperature, and bright lines make their appearance together with broad bands. Under certain conditions of spark, without the Leyden jar, bright bands (agreeing with those of olefiant gas and other hydrocarbons) are seen on a background of continuous spectrum.

With regard to the continuous spectrum of the nucleus, it has been suggested that this is due to reflected sunlight, but in that case there would be strong polarisation; and though I have detected some trace of polarisation of the nucleus, it is very slight, and certainly not sufficient to justify this hypothesis. We may, however, readily fall back on the theory of a compressed gas or of a number of solid particles. Whatever be the composition of the nucleus, it seems probable that the jets of light which give a similar spectrum are similarly constituted.

Mr. Ranyard has made some observations of polarisation of the tail, which he concludes to be very slight. I have, however, on one occasion at least, found it very appreciable, and feel quite confident that the tail is partially polarised in a plane through the sun, indicating reflection of the solar light.

W. H. M. CHRISTIE.

NOTES AND NEWS.

THE question of the shrinkage of a collodion film in drying after exposure in the camera, is one which has excited a great deal of attention among those interested in the application of photography to the transit of Venus, for naturally the accuracy of the measures of distance between the centres of the planet and the sun, must depend greatly on our knowledge of the scale at every point of the film. With wet collodion plates there was much diversity of opinion, Dr. Paschen, in Germany, maintaining that there was considerable shrinkage, and that it was variable; whilst Mr. De la Rue in this country, and Dr. Rutherford in America, found that if the glass plate were properly roughened, or otherwise prepared so as to secure adhesion of the film, no contraction occurred in drying. Subsequently the dry plate process was adopted, and all risk of error from this cause was supposed to be at an end. M. Hermann Vogel, of Berlin, has, however, revived the dis-

cussion in the *Astronomische Nachrichten*, and though he finds contraction with certain kinds of collodion, apparently from not having paid sufficient attention to the adhesion of the film; yet his results are, on the whole, very reassuring, his conclusion being that with the use of a suitable substratum, and with due care in development, no appreciable shrinkage takes place.

Dr. SELLACK at the Cordoba Observatory has been trying some experiments with a view to getting photographs of the solar prominences without the spectroscope. His idea is to absorb the violet rays of the sun's image by interposing a film of silver iodide, and then to obtain a photograph on iodized collodion, which is only sensitive to the violet and indigo rays. The image will thus be formed by rays belonging to that small portion of the spectrum which can both pass through the silver iodide film, and also act on the sensitised collodion, and in this region lies one of the hydrogen lines emitted by the prominences. The sun's light being thus reduced in the ratio of the above-mentioned small part of the spectrum to its whole length, Dr. Sellack anticipates that the much larger portion of the light of the prominences will be bright enough to stand out against the enfeebled background of scattered sunlight. He has, however, not yet succeeded in obtaining any decisive result.

AN important contribution to our knowledge of stellar spectra has been made by Dr. Vogel, of Bothkamp, in a paper in the *Astronomische Nachrichten*. Starting from Secchi's classification of the spectra into four types, he extends and modifies it, and attempts to give some idea of the physical and molecular condition of the stars hitherto examined.

In this new arrangement Secchi's third and fourth types are merged into one, and the three classes are:—

1. White stars at a high temperature, showing very fine absorption lines.
2. Yellow stars (like our sun) at a somewhat lower temperature, exhibiting strong absorption lines of the vapours in their atmosphere.
3. Red stars in which the temperature is so low that combination of the elements in their atmospheres takes place, and compound molecules are formed, which, as Lockyer has shown, give rise to broad absorption bands forming channelled spectra.

The first two classes are further subdivided according as cool hydrogen causes absorption lines, or as these are altogether wanting; or, finally, as incandescent hydrogen exhibits its bright lines on a less bright continuous spectrum. The third class does not admit of this subdivision, but splits up into two sections, in one of which the dark bands are sharply defined on the red side, shading off towards the blue, whilst in the other the reverse is the case. Dr. Vogel has, with the assistance of Dr. Lohse, commenced a systematic spectroscopic survey of all stars down to the 4½ magnitude, from 10° south of the equator to 20° north, and this work is already half finished. It is to be remarked that many of the variable stars have been examined; some of them show bright lines, but in most cases it appears that their increase in brightness is caused by dark absorption lines fading out. We have evidently yet much to learn on this subject, and Dr. Vogel's classification can only be accepted as provisional, but he appears fully justified in fixing on hydrogen as the characteristic of his types.

IN two papers recently read before the Royal Society Mr. Lockyer continues his researches on the branch of Spectrum Analysis to which he has recently devoted so much attention. When first the spectroscope was applied to the examination of the light emitted by terrestrial elements or by the heavenly bodies, physicists confined their attention to distinguishing the spectra of different substances, but it was soon found that these spectra varied in a wonderful manner under

various conditions of temperature and pressure, and a rich field of physical enquiry has thus been opened out. Considering that the lines in the spectrum of any substance represent the modes of vibration of which its molecules are susceptible, or in musical language the notes to which they respond, it is evident that changes in the spectrum must give us much insight into changes of molecular condition, one of the most interesting subjects of enquiry. From his researches on various spectra, Mr. Lockyer is led to assume five stages of molecular arrangement, proceeding from the simplest form which gives a line spectrum, to the fifth which produces a continuous absorption.

According to this view, the higher the temperature the simpler will be the molecule; and further, solids, liquids and dense vapours have a more complicated molecular constitution than the same elements in a rarefied state. In this theory no account would appear to be taken of the jostling which one molecule suffers from others near it in the case of a dense vapour; in fact, Mr. Lockyer's object appears to be to refer all variations to changes within the molecule. The researches are not yet complete, but Mr. Lockyer has obtained already most important results. Among these may be mentioned his conclusions that the vapour densities of the elements in the sun's atmosphere more closely agree with the older atomic weights (magnesium vapour being lighter than sodium), and that the vapours of different elements are in different molecular conditions at the same temperature.

MR. MALLET has made some experiments on the interesting question whether certain metals expand in solidifying, as is the case with water and bismuth, and has presented the results in a paper read before the Royal Society. His conclusion is that the specific gravity of cast iron is greater in the solid than in the liquid state, but that, notwithstanding this, the solid metal floats on molten iron, and, strange to say, the same is the case with lead, a metal which contracts greatly in solidifying. The object of the author is to disprove the theory propounded by Messrs. Nasmyth and Carpenter in their work on the Moon; but their main point, that solidification will proceed from the exterior remains unaffected, though probably their argument may require some modification.

PROFESSOR NEWTON, in the *American Journal of Science*, points out an apparent tendency of the disturbing forces to draw meteorites and comets into orbits of small inclination to the ecliptic. Whilst the inclination of the paths of several comets is decreasing, no instance of an increase has been observed; but he has not yet succeeded in finding any term in the disturbing function to account for this.

It is our pleasing duty to report that the Sub-Wealden Exploration, which has hitherto been conducted almost solely by private enterprise, is now to be assisted by a Government grant. A short time ago Professor Ramsay and Mr. Henry Willett waited upon the Chancellor of the Exchequer, and pointed out the precise object of the exploration, with the view of seeking aid from the Government. We understand that this application has resulted in the recommendation of a grant of 1,000*l.*, to be paid at the rate of 100*l.* for every hundred feet pierced in excess of 1,000 feet. For example, if the boring should be continued to 1,500 feet, the committee would be entitled to draw 500*l.* Whilst admitting that this assistance will be a great encouragement to the committee, it should not be forgotten that the grant will meet but a small portion of the working expenses. Let us hope, then, that private effort, so far from being relaxed, will be greatly stimulated by this national recognition of the importance of the work.

HERR GÜMBEL, writing in a recent number of *Das Ausland*, states that a grey-spotted Japanese marble, of which many specimens were seen at the Vienna Exhibition, contains fossils of a giant foraminifer, which he names *Fusulina Japonica*.

He describes it as shorter and thicker than the Russian species, *F. cylindrica*, and as having more numerous channels and the chamber-walls further apart. In a black basaltic-looking rolled stone he found fine grains of leucite and nephelin, while other rock specimens exhibited the true coal formation and quicksilver ores. He also mentions rocks containing graphite and tourmaline. In the older tertiaries was *Nautilus lingulatus*, and in the newer ones brown coal. Osidian was found under basalt.

THE Norwegian zoologist, G. O. Sars, has made some interesting discoveries in the postembryonic development of the lobster. During his last excursion to the west coast he was so fortunate as to meet with three distinct phases of this development; and in a treatise just published by the Society of Sciences in Christiania, he minutely describes these three larva-stages, and illustrates them by microscopical dissections. It is believed that these discoveries will materially aid the Norwegian Government in protecting and encouraging the reproduction of the lobster, which is so valuable an item of national revenue.

WE were only able last week to mention the bare fact of Professor Ångström's death. The great physicist, whose comparatively early decease is a distinct loss to European science, was born on August 13, 1814, near Hernösand, in Sweden, studied at Upsala, became Teacher of Experimental Physics there in 1840, and finally Professor of Physics in 1858. Almost all the learned bodies of Europe had elected him into their number, the Royal Society among the rest. It is by his discoveries in spectrum analysis that his fame is chiefly supported. That the spectrum of the electric spark contains a number of coloured lines, Fraunhofer had already pointed out; but it was first through Ångström's examination of the spectrum in 1853 that the cause of this phenomenon became manifest. Ångström discovered that these lines come partly from the incandescent gases from the metals between which the discharge takes place, partly from the gases which the spark traverses. It may be said that this discovery was the foundation of the science of spectrum analysis. About the same time Ångström analysed the lines Fraunhofer had observed in the solar spectrum, although he did not at once perceive the consequences of his discovery; he explained, even then, that the dark lines in the spectrum have to be considered as the reverse of the bright lines in the spectrum of the electric spark. It was to prove this experimentally that Kirchhoff gave so much attention to the examination of the condition of the sun's atmosphere, in 1860. In 1866 appeared Ångström's great work, *Recherches sur le Spectre Solaire*, which takes a classical place in scientific literature, in which are delineated the lines in the whole solar spectrum from A to H. Among other interesting observations, Ångström points out that the aurora borealis produces a pencil of light which recurs only in a ray from the zodiacal light. Besides these great experiments, Ångström pursued a variety of other investigations into important questions of higher optics. Of his astronomical labours, the most important were his observations of the influence of the smaller planets upon the periodical return of comets, and his acute method of determining the irregularities in the orbit of Halley's comet. He died at Upsala on June 21.

THE Swedish philologist, Professor Petersson, is dead.

THE 72nd number of the Bulletin of the Société Vaudoise des Sciences Naturelles was published in June, and contains F. A. Forel's materials for the study of the deep-water fauna of the Lake of Geneva, and also the completion of Professor Renevier's remarkable Geological Tables of the primary, secondary, and tertiary formations.

PROFESSOR TH. BREDICHIN, the Director, has just published the first volume of the Annals of

the Astronomical Observatory of Moscow, which contains the observations made there from October 23, 1858, to December 28, 1861.

THE Academy of Natural Sciences of Catania have lately issued the seventh and eighth volumes of the third series of their Transactions, which contain several interesting biological, geological, and meteorological papers, and also geological plans of Catania at different periods.

THE Royal Society of Victoria have continued the publication of their Transactions and Proceedings after an interval of six years. In 1868, the Government grant was unexpectedly withdrawn from the Society, who were left without funds even to pay for the printing of the last volume published. The grant has now been renewed, and the tenth volume has just been issued. Among the contents are three anniversary addresses by the President (Mr. R. L. J. Ellery), and accounts of important work done with the great Melbourne telescope, which show the progressive changes that the nebulae have undergone; also a paper, by Mr. Pain, "On Aboriginal Art in Australasia, Polynesia, and Oceanica, and its Decay."

MR. MINAYEFF, Professor of Sanskrit at St. Petersburg, the editor of the *Pāṭimokkha*, has started for Ceylon, where he intends to spend some time in Pāli studies. He will probably make a collection of Pāli MSS. for the Russian Government.

Etymological Vocabulary of the Latin Language. ["*Etymologisches Wörterbuch der Lateinischen Sprache.*"] By A. Vaniček. (Leipzig, 1874.) This is a useful compilation, chiefly founded on Bopp, Corssen, Curtius, and Kuhn's Journal. The words are arranged according to their roots. We regret that Dr. Vaniček should not have added his authorities. An etymology, as a mere fact, is of small value. What is important is the proof, and that proof, though it cannot be given at full length in a dictionary, should at all events be rendered accessible by proper references. This is what gives a special value to Curtius' *Grundzüge*, where no etymology is quoted without the authorities to support it.

Linguistic Introduction to Greek and Latin. ["*Sprachwissenschaftliche Einleitung in das Griechische und Lateinische für obere Gymnasialklassen.*"] By F. Baur. (Tübingen, 1874.) This is a short abstract of the results of Comparative Grammar, with special reference to Greek and Latin. It may be useful to school-boys, if the teacher can impart life to the skeleton, but the only way to do this effectually will be by bringing in Sanskrit, and not the so-called typical forms of the Aryan *Ur-sprache*.

Exempla Inscriptionum Latinarum composuit Gustavus Wilmanns. (Berolini, 1873.) A book that can be thoroughly recommended. The selection of Latin inscriptions is made by Professor Wilmanns, who is himself one of Professor Mommsen's assistants in the great *Corpus Inscriptionum Latinarum*. The arrangement of the inscriptions is according to the subjects. We have in the first volume *tituli sacri*, then *tituli sepulcrales*, *honorarii*, *tituli operum publicorum*, *tituli domus imperatoriae*, *tituli virorum ordinis senatorii*, *tituli procuratorum*, *tituli magistratuum minorum*, *tituli militares*. In the second volume are given the *tituli municipales*, the inscriptions referring to public performances, and miscellaneous inscriptions. The *indices* are most ample and exceedingly useful. There is an index of *nomina*, an *index geographicus*, an index of *res sacrae*, others of the emperors, kings, the republic, military matters, the provinces, municipal matters, colleges, arts, public games, one of *notabilia varia*, another on the *titulorum forma*, on *carmina*, and on *compendia scripturae*. We should have liked here and there some explanatory notes. These, however, are intended to be supplied by the lecturer, the book being written for the use of professors and stu-

dents in the German universities. We wonder whether the eminent Oxford Professor who lately described the professorial system of teaching as "barbarous," would condescend to use this manual for his Latin class.

MEETINGS OF SOCIETIES.

ROYAL HISTORICAL AND ARCHAEOLOGICAL ASSOCIATION OF IRELAND (*Thursday, July 2*).

THE Summer Meeting of this Society was held in the rooms of the Association on July 2. Several new members were elected, including Patrick Martin, Esq., M.P. for Kilkenny, and the Dean and Archdeacon of Limerick.

Mr. John Hogan presented to the Society a collection of manuscripts concerning the diocese of Ossory, which the bishop, Dr. Moran, was now engaged in publishing under the title of *Spicilegium Ossoriense*. These MSS. had formerly been in the possession of Bishop de Burgo, having been transcribed by him from a MS. belonging to James Phelan, who was bishop of the same diocese in the reign of James II. They contain a visitation of the diocese and a list of parish churches during the episcopate of Dr. Phelan; a taxation of the diocese in the reign of Henry VIII., and a number of letters referring to the Confederation of Kilkenny.

The Rev. R. H. Dunne communicated an account of a stone carved with the emblems of the Passion and other sacred subjects arranged as armorial bearings. This stone is now built into the wall of Ballylin, the residence of John G. King, Esq., near Ferbane, King's County, having been taken from the ruins of an old building in the neighbourhood. Mr. Dunne read a letter from the Hon. Miss Ward, who thus describes the sculpture: "For a crest there is the cock which crowed on St. Peter's third denial. It is mounted on a short perch or pillar, and this on a helmet. Below, surrounded by finely designed heraldic mountings in *alto relievé*, is a shield with a cross and its surroundings, the heads of St. John, the Blessed Virgin Mary, and two others, with various small objects, such as the nails, the hammer, and the dice cast by the Roman soldiery for the Saviour's vesture. Above the whole design, and stretching across the stone, are the words:—

'Arma Redemptoris Christi Jesu. A. 1688;'

and below the shield is the curious verse-like motto—

'Aurea resplendent sine fructu insignia regum,
Arma Redemptoris sparsa cruore rubent.'

It seems that there is a very similar stone at Kilcolgan Castle, dated about 1640. During the discussion which ensued, it was stated that there were carvings of the arms of our Saviour at Elgin Cathedral, and on a prebendal stall in some continental cathedral. Mr. Prim suggested that the stone in question had probably belonged to the Monastery of Wherry, near Ferbane, and referred to Morgan, Cussans, and other heralds, who assign coat armour to Adam and Eve, Abraham, and many other personages of sacred history.

The attention of the Society was also called to the monuments of the Knights of St. John at Hospital, and to a curious tomb which has just been opened near Ennis.

ENTOMOLOGICAL SOCIETY (*Monday, July 6*).

SIR SIDNEY SMITH SAUNDERS, C.M.G., President, in the Chair.

Professor Westwood exhibited specimens of *Haltica aurata*, which he had found to be very injurious to young rose leaves. Also a portion of a walnut attacked by a Lepidopterous larva, probably a *Tortrix*, but he was unable to name the species, as it produced only an ichneumon. It was the first instance he had known of a walnut being attacked by an insect in this country. Mr. F. Moore stated that he had, on one occasion, reared *Carpocapsa splendana* (a species that usually feeds

on acorns) from a walnut. Professor Westwood made some remarks on the Yucca moth (*Pronuba Yuccasella*, Riley), of which some fifty specimens had been sent to him in the pupa state by Mr. Riley; but he had succeeded in rearing only three. He exhibited a drawing of a portion of the insect, showing the extraordinary form of the palpi, which were especially adapted for collecting the pollen with which it impregnated the female flowers. He directed attention to a full description of the insect and its habits by Mr. Riley in the Sixth Report of the Insects of Missouri. Professor Westwood also exhibited some bees which had been sent to him from Dublin, having been found attacking the hives of the honey-bees. They were smaller than the honey-bee, and black, and he considered them to be only a degenerated variety of *Apis mellifica*. He suggested the probability of their being identical with the "black bees" mentioned by Huber. Mr. Champion exhibited *Amara alpina* and other beetles, from Aviemore, Inverness-shire. The Secretary exhibited some specimens of a Dipterous insect which had been found in the larva state in an old Turkey carpet. The larva was very long, slender and serpentine, white and shining, and had somewhat the appearance of a wire-worm, but was much longer, and without feet. The name of the insect had not been ascertained. Mr. Bond exhibited specimens of *Argas pipistrellae*, parasitic on a bat, and also some *Acairi* from a small species of fly; both were from the Isle of Wight. Mr. W. C. Boyd exhibited specimens of *Thecla rubi* from St. Leonard's Forest, differing in certain points from the ordinary type. Mr. Wormald exhibited a collection of butterflies sent from Japan by Mr. H. S. Pryer. Mr. W. Cole exhibited some galls of a species of *Cecidomyia*, found in West Wickham Wood. Mr. F. Smith exhibited some earthen cocoons found on wet mud at Weymouth by Mr. Joshua Brown. They proved to belong to a Dipterous insect (*Machaerium maritimum*), one of the *Dolichopidae*. Mr. S. Stevens exhibited specimens of *Asopia nemoralis* from Abbot's Wood, Lewes, and other Lepidopterous insects. Mr. Butler exhibited a copy of a very rare (if not unique) book, which had recently come into the possession of Mr. E. W. Janson, entitled Lee's *Coloured Specimens to Illustrate the Natural History of Butterflies* (London, 1806). He could not find that it had been quoted in any synonymic catalogue, and it contained drawings and diagnoses of nineteen species of butterflies. The Rev. H. S. Gorham read descriptions of species of Endomyid Coleoptera not comprised in his catalogue *Endomycei recitati*. Also, some remarks on the genus *Helota* (*Nitidulidae*), of which he described a new species from Japan. Dr. Sharp communicated a supplementary paper on some additional Coleoptera from Japan. Professor Westwood communicated descriptions of new species of *Cetoniidae*, principally from the collection of Mr. Higgins. The President announced that the library of the Society would remain for another year at No. 12, Bedford Row, and it was hoped that by the end of that time some more permanent and suitable accommodation would be obtained for it. Part III. of the Transactions of the Society for 1874 was on the table.

NEW SHAKSPEARE SOCIETY (*Friday, July 10*).

F. J. FURNIVALL, Esq., Director, in the Chair. After the names of twenty-two new members had been announced, Mr. R. Simpson read a paper "On the Political Use of the English Stage in Shakspeare's Time." He did not strengthen his position by referring to such a use of the stage by the ancient dramatists, or by the contemporary drama of France, Italy, or Spain; neither did he show the natural development of the moral and the mystery into the political play, when the Reformation more or less identified religion with politics. He discussed the case as it existed in England. In the first part of his paper he gave a selection of those historical references to the English stage

which testified to its use as a political engine between 1544 and 1614. In the second part, after explaining various reasons for the obscurity of the political allusions in the plays which we possess, he rapidly glanced over a number of them where these allusions may be recognised, and these plays he divided into five categories: 1. Those which seem to aim at a didactic purpose of teaching general principles of politics. 2. Those which refer to some special controversy or event of the day, as the Queen's marriage, the relations of Spain and Philip II. with England, the Martin-Marprelate movement, the relations between Scotland and England, the oppression of the people by taxation, the controversy between the Cecilians and Essexians, and the tragedy of the Earl of Essex. 3. Those which refer to social questions—the vices of the country, the decay of hospitality, the increase of luxury, and the like. The vices of classes—the oppression of landlords, the cruelty of usurers, the chicanery of the law, the cheats of trade, or the villany of the nobles. 4. Those which refer to persons, as the series of dramas which refer to the quarrel between Ben Jonson on one side, and Dekker, Marston, and the actors of the common stages on the other, or to the academical controversies in relation with Raleigh, the Duke of Northumberland, and Hariot. And the dramas which discuss the question whether age or youth should preside at the council board and in the field, when Bughley became the type of the one and Essex of the other. The fifth and last category of dramas to which Mr. Simpson referred was that where the abjuration of all political meaning becomes an index of the political intention of the piece—namely, to teach that politics were to be left to statesmen, and that the private man had nothing to do but to obey. The paper was meant to be a general preface to a series of papers in which the writer purposes to point out the political allusions in Shakspeare's plays. Except in this relation, it had no special reference to Shakspeare.

In the discussion which followed, Mr. Furnivall sketched briefly the development of the early religious and later moral drama into that of the Elizabethan era, contending that it was the Reformation that—as in Bale's plays, *New Custom* (Captain Cox's *Nu Guize*), &c.—first brought politics on to the stage. In a stirring time like Elizabeth's, it was fair to expect political allusions largely in the drama, unless it was true that in the case of Shakspeare, the greatest artist rose above the circumstances of his time. Mr. Hales urged that not only did Shakspeare so rise above these circumstances, but that in all times the truly great artist did so. In Greece the allusion-period of the drama preceded Sophocles. Aeschylus was but a Marlowe. So Peele and Nash were full of allusions, but Shakspeare was a supreme artist, not a dramatic pamphleteer. Compare again Spenser's *Faery Queen* (crammed with allusions), and Milton's poems with hardly any. So set Smollett, or Disraeli's *Lothair*, against Fielding, or any of George Eliot's works: the poorer writer was the one full of political allusion. Mr. Hales doubted Marlowe's *Tamburlaine* being meant for Philip II. The one plainest political touch in Shakspeare was his allusion, in *Henry V.*, to Essex in Ireland. Dr. Brinsley Nicholson said that no doubt when Shakspeare set his bragging Spaniard on the stage in *Love's Labours Lost*, England was not very friendly with Spain; that when *Henry V.* was written we were less close to France than when *All's Well* was produced; but he could not admit that any of Shakspeare's plays was wholly political. He also held that *Tamburlaine*, the Scourge of God, was not Philip II., though Lyly's *Midas* was; and that Shakspeare was not alluded to in *Histrionicus*. Dr. Abbott agreed with Mr. Hales that as art developed, political allusions fell off. Shakspeare's nature, too, was not cynical, or bitter; he had little satire against persons, etc., and had only four political allusions in his plays—the touching for the king's evil in *Macbeth*; Elizabeth's

baptism (by Fletcher) in *Henry VIII.*; her virgin state in *A Midsummer Night's Dream*; Gaunt's speech in *Richard II.*, act ii. sc. 1. He did not believe that the complaints of extortions in *Richard II.* pointed to Elizabeth's time. Mr. Furnivall closed the meeting with a short review of the Society's four months' work, and stated the changes as to printing papers in advance, &c., next session, that experience has shown the necessity of.

FINE ART.

Ancient and Modern Furniture and Woodwork in the South Kensington Museum. Described, with an Introduction, by John Hungerford Pollen. (London: Chapman & Hall, 1874.)

THIS is another of the admirable analytical catalogues of the treasures of the South Kensington Museum, published by the Committee of Council on Education, preceded by an introductory essay, in which Mr. Pollen takes in review the furniture of all ages, in chronological order, beginning with that of the Egyptians, as exemplified in their paintings and monuments. On the walls of their tombs are detailed pictures of their domestic life, from which we see the forms of their chairs and their couches, and of their chariots, richly inlaid with ivory and gold. The furniture of Nineveh is not so completely represented, but sufficiently so to enable us to form some judgment of its style. Of Hebrew furniture few details are known; but whatever the technical qualifications of their artists, they must have been acquired in Egypt. Designs from Greek furniture abound in the paintings of their vases and sculptures, as do those of the Etruscans in their painted tombs, where we recognise couches, tables and seats similar to those found at Pompeii, the earlier Roman arts being derived from the Etruscan cities. Mr. Pollen gives an elaborate description of the sumptuousness of Roman house furniture in the Imperial era, and of that of the Byzantine Empire, when thrones, beds and seats were decorated with gold, ivory, and incrustations, and covered with the most brilliant tissues, themselves enriched with jewels. But in this magnificence there is little to admire; purity of taste was sacrificed to richness of ornament.

Of the early ages we have no furniture handed down to us. The chair of St. Peter at Rome, of wood overlaid with carved ivory and gold, now concealed by the bronze covering of Bernini; the ivory chair of St. Maximian, Archbishop of Ravenna, of the sixth century, also overlaid with carved ivory; and the bronze chair of Dagobert, of the seventh, an antique curule chair said to be the work of St. Eloi, to which the Abbé Suger added a back and arms in the twelfth, are among the few exceptions; and we derive no information from missals or manuscripts, as in the tenth and eleventh centuries the figures and subjects on these were painted upon a gold ground.

But in the twelfth, furniture partook of the growing improvement in all the arts of design. Beds, seats, and chests were decorated with paintings and carvings; oak was employed for furniture in England, France, and Germany; and wood was turned with the lathe.

In the thirteenth and fourteenth centuries

mediaeval art had reached perfection; every kind of enrichment was used in the decoration of furniture, which all bore an architectural type.

The Italian furniture of the fifteenth century, the "quattro cento," is gilt and painted. The large and imposing coffers it was the custom to have in those times to contain clothes and linen were painted in subjects, and the Museum contains specimens by the Florentine Dello Delli, who was solely employed on works of this kind. They were sought by foreign princes, and Vasari states that Matthias Corvinus carried two magnificent marquetry coffers back to Hungary, the work of Benedetto da Marano.

Besides this style of ornamentation, the Venetians introduced from Persia and India another beautiful system of surface decoration—the manufacture of marquetry, an inlay of ivory, metal and stained woods, arranged in geometric patterns. The best artists of the day did not hesitate to apply their talents to the adornment of chests, caskets, cabinets, seats, tables, and every description of furniture in daily use.

Roman discoveries added a fresh element to the artistic resources of the Renaissance. In the Baths of Titus, Raffaele, it is said, first obtained the idea of the beautiful painted arabesques with which he decorated the Loggia of the Vatican; but if not first introduced by him, the use he made of them, and the fame of his own attainments, spread the style over all Europe. In the hands of great artists this kind of ornament was used with consummate grace, either painted on walls, moulded in plaster, or carved in woodwork.

In France, the artists invited by Francis I., and subsequently by the Medici queens, brought in this style. Furniture and every object for domestic use were covered with extravagant imagery and fantastic scrolls, and the imagination of the artist was exclusively exercised on mythological and classical subjects. All traces of the national style of Gothic art disappeared, and the influence of Cellini, Primaticcio, and the other great Italian masters, is shown in the works of even Jean Goujon, Bachelier, and other French contemporary artists who designed for wood furniture.

In England the change was not so sudden. The Tudor furniture was a mixture of Italian and German character, inspired by Holbein, who designed for woodwork, as we have many evidences. Cabinets with architectural façades, and heavy oak furniture continued in the Elizabethan and Stuart periods. Marquetry became the fashion under William and Mary, when upright clocks, bureaux, and chairs were so decorated, and the oak panelled tester bed with carved posts was replaced by rich hangings of velvet or tapestry, sometimes surmounted by ostrich feathers, as we see in the stately royal beds at Hampton Court.

Under Louis XIV., a new style of decoration appeared, to which the maker gave his name. André Charles Buhl, who afterwards changed his name to Boulle or Boule, was chief upholsterer to the King, and this rich and brilliant marquetry of tortoiseshell and brass, so combined as to form figures and subjects, was extensively used in the furnishing of the new palace at Versailles.

Then follows the reign of Louis XV.—the period of the broken fantastic forms, rock and shell-shaped curves, and undulating lines, to which the term *rococo* (from *rocaille* and *coquille*) is applied, inspired by Bernini and his school. Painters arose who devoted themselves to the painting of rooms. Panels inserted in the ceilings, and *dessus-de-portes*, over the doors, generally in chiaroscuro—nymphs, Cupids, and shepherdesses formed the subjects of room decoration. Martin, the carriage painter, introduced the gold varnish which bears his name. Room decoration reached its climax under Louis XVI. The discovery of Pompeii caused a return to a healthier and better feeling for classical art. Boucher, Natoire, Fragonard, and others, were employed in painting the rooms, while Reisener and David executed their light marquetry furniture in exotic woods, enriched with the ormoilu mountings of Gouthière.

In England the names of Chippendale, Heppelwhite, and Sheraton, are associated with the mahogany furniture of the last century, tables with pierced galleries, chairs with pierced strapwork backs, knife-cases, tea-chests, &c., all of admirable workmanship, while Cipriani and Angelica Kauffman painted medallions on the satin-wood furniture in fashion during the last half of the century.

Independently of its high value as fully illustrating the furniture in the South Kensington Museum, Mr. Pollen's able history of furniture is published at a time when it is of special interest.

The sale of Mr. Morant's collection of the English mahogany and satin-wood furniture of the last century, and that of Mr. Barker, with its unprecedented series of the rich productions in France of the reigns of Louis XIV. to Louis XVI., have turned public attention to the subject, and in Mr. Pollen's work will be found diligently collected all that has hitherto been gathered relative to the great decorators and their works.

F. BURY PALLISER.

EXHIBITIONS IN PARIS.

Paris: July 7, 1874.

The Exhibition treated in my last letter, for the benefit of the inhabitants of Alsace and Lorraine who have taken refuge in Algeria, has announced two additional catalogues to supplement those already published. The catalogue of pictures alone contains 352 new canvases or panels, and the curiosities have been added to in the same proportion. The prevailing taste has been consulted by allotting the largest space to the French school of the eighteenth century, and to that of the present day in the works of some of its recently-deceased members—Delacroix, Théodore Rousseau, &c.

An exhibition has been open during the last few weeks, and will continue until the end of this month, of the works of a French artist distinguished for his etchings and charcoal drawings—M. Maxime Lalanne. This exhibition is held at No. 29, Rue de la Chaussée d'Antin, in the apartments of a club. It is seldom that the French clubs lend their aid to these exhibitions, which benefit the public as much as the artists. But this is called the Literary and Artistic Club. It therefore only carries out the promise of its name. The public, however, in spite of the kind endeavours of the press towards making it known, has not yet visited this exhibition in any numbers corresponding with the interest which it affords.

M. Maxime Lalanne is a native of Bordeaux. During a tour he took in the Pyrenees in his youth he exhibited in the shops of the picture-dealers the sketches of the picturesque scenes which abound in those rugged mountains and green valleys: views of the Pic du Midi, of the Gavarnie and the Lac Bleu, of waterfalls and pine forests, and of meadows enamelled with brilliantly coloured rhododendrons. These were bought by travellers, foreigners, and invalids, less for the sake of their artistic qualities, although they were eminently free and picturesque, than as souvenirs. An amateur offered to engage Lalanne as a drawing-master, and took him all over Spain nearly twenty years ago. Since that time Lalanne has travelled in Switzerland, France, and England. His drawings in pencil and charcoal are executed with equal skill. He has also etched a good deal. His touch is fine, but somewhat hard, correct but rather too sharp. His bite is perfectly even, without any of those irregularities which counteract monotony. Some years ago Lalanne published a treatise on etching. It contains excellent practical hints, but the writer seems wholly occupied with the means of preventing accidents or repairing them, to such an extent that one of his fellow-artists described it as a treatise on the diseases of etching. Maxime Lalanne stayed in Paris throughout the Prussian siege. Some of his colleagues were so dastardly as to fly from France, and while their native city was being bombarded, make large sums of money in foreign countries. He saw Paris arm her ramparts as a woman clothes herself in mail. He thought her proud look in this new dress and this new attitude as becoming as it was striking. He took with extreme care and precision views of the principal ramparts bristling with cannon and of the lines of defence. These sketches, executed with more than usual feeling, will possess in future times all the interests of a journal kept day by day during one of the sharpest struggles for life which France has experienced.

Lalanne contributed some finished and elegant woodcuts to the *Paris Guide* published during the exhibition of 1867, a book composed of excellent materials ill put together. His real genius lies in the interpretation of the environs of Paris—a landscape exquisite but mannered, where nature exhibits the brilliant but superficial and arbitrary attractions displayed in the toilettes of our Parisian ladies. These correct and graceful sketches of garden scenes, of incidents during the siege, and of the interior of Victor Hugo's house at Guernsey, place Lalanne high among contemporary engravers.

The City of Paris is exhibiting in the Orangery of the Luxembourg Gardens forty designs for a House of Correction to be built at Nanterre, on the banks of the Seine. Since the fall of the Empire—i.e., since she acquired the right of electing her own Municipal Council—the City of Paris has loyally adopted the system of public competition. The plans for the reconstruction of the Hôtel de Ville were submitted to this system as well as those for the monuments which are to be erected in the environs of Paris, on the spot where her children poured out their blood for her sake. The department of the Minister for the Fine Arts looks uneasily at the progress of this system, which in time threatens to deprive it of the privilege of privately distributing commissions for the public works to its own flatterers, or to the artists protected by the Church. The moral and material advantages of competition are, however, considerable. Dignity of character, which has been so lowered in our day, will revive once more. The designs submitted are numerous and carefully drawn. The Council offers prizes of 5,000 fr. to the five most approved plans, and reserves to itself the privilege of making use of the best points in each. A third of the jury is nominated by the Government, a third by the town council, and a third by the competitors. Thus every interest is represented and intrigues

are rendered difficult. The press and the public are to be consulted, for the plans will be exhibited for a fortnight before the votes are taken. In the competition for the Hôtel de Ville, when, however, the intrigues of the "Institut" unfortunately gained the day, the names were noticed of several young architects who until that time had been unknown, and would have long remained so.

This House of Correction will in many respects resemble an English workhouse. It is to contain prisoners of both sexes who have been condemned to short sentences, vagabonds, and old people. The rules, therefore, should not, we think, be too stringent. But the administrative traditions have prevailed. Most of the competitors have adopted the radiating ground-plan which is supposed to enable a warder placed in the centre to keep an eye over the whole. Physiology, in these days the watchful protector of humanity, has shown that these agglomerations of human beings foment diseases as dangerous for their guardians as for the guarded; so that, while economy is studied by reducing the numbers of the guardians, the balance is restored by the additional pensions granted to their widows. One only of the competitors, M. Emile Violar, son and brother of distinguished physicians, and himself a man of heart and intelligence, the founder of a valuable private institution for the special study of architecture, has boldly ventured to attack the modern problem. He has shown triumphantly that art and science are not without humanity. His plan—simple, elegant, and reasonable—places the offices and the apartments of the directors at the entrance; a little farther on, the Catholic and Protestant chapels and the Jewish synagogue; beyond these a wide field, at the end of which is placed the hospital on a raised terrace exposed to every breath of air; and all round, side by side, the dormitories, workshops, and yards of the inmates. They will thus have plenty of sun and air, the two most powerful contributors to moral and physical health. These proposals are, perhaps, very bold in the present day. Let us hope, however, that barbarism may not prevail over charity, *Caritas*. M. Emile Violar and M. Simonet, his colleague, have accompanied their plans with a paper to which I wish to direct the attention of the architects and critics on the other side of the Channel. It discusses from a very high point of view the humanitarian ideas which in these days enter into all administrative questions.

I shall soon have to write to you respecting another competitive exhibition—for the church of Notre Dame du Sacré Cœur, the erection of which, on the heights of Montmartre, was voted by the present National Assembly at the time when the clerical party had a triumphant majority. The seventy-seven designs which have been sent in will be exhibited from Thursday next at the Palais de l'Industrie in the Champs Elysées.

I am really embarrassed when I have to speak of the works of the art students in Rome now exhibiting in the galleries of the École des Beaux Arts, looking on the quay. Their number is small. But the fault must not be laid to the account of the students of the Villa Medici. These specimens of their work are every year made the subject of a notice written by the members of the Institute, section of the Fine Arts. This notice is sent to the scholars for their improvement. It seems that these reports (giving only about twenty lines to each object) seldom reach Rome before the next year's contributions are already on the point of departure. In order, therefore, to give more time for writing the notices, the specimens have this year been sent earlier than usual. So that the sculptors especially were not ready in time.

The only piece of sculpture is a plaster bust of a young musical composer, M. Paul Paget, by M. Lafranc. M. Lafranc received this year from the Salon a first-class medal, which caused many sad reflections on the partiality of the jury. He had presented a little St. John the Baptist crying in the wilderness at an age when the most mys-

tical children generally care for little beyond a game at ball. The bust I have mentioned—cold, and without any elevation of style—by no means justifies the distinction awarded to the little St. John. Another student, M. Dupuis, sends two bas-reliefs in wax: the subject of one is Orpheus lamenting Eurydice, the other is a profile of Peace; a copy in intaglio on steel, of a medal of Alexander, and a bas-relief of Chloë drinking at the fountain—a graceful study in profile of the figure of a young girl standing and leaning forward.

The contributions of the architects are more worthy of the support of the State. M. Bernier sends several sketches of the Basilica of Pales-trina; M. Ulmann, of the Temple of Mars the Avenger at Rome; M. Thomas, of the Temple of Priene, in Asia Minor; and M. Dutert, of the Forum of Rome. These works consist, first, of sketches painted very cleverly in water-colour, representing the actual state of the ruins, and next, of a series of plans for their restoration, founded upon those remains which have been already discovered, as well as upon more or less probable conjectures. It is pretty evident that M. Thomas must have visited London to finish on the spot in the galleries of the British Museum his sketches of the marble torsos and limbs which strewed the ground of the Temple of Athene Polias. Your museums are so hospitable that it is only our national vanity which makes us regret the removal of these treasures from their native soil. But the activity of your agents for the purchase of objects of art is formidable!

The engravers have sent only a few drawings, below mediocrity. It is strange that a set of young men so liberally treated should not have produced a single copper-plate engraving, or even an etching. But why, indeed, send engravers to learn their business in Rome? it is the height of absurdity. Too many influential personages, however, are interested in this question for us to hope that these abuses will cease for a long time.

Two original pictures, one copy and one sketch, form the whole contribution of the painters. The copy and the sketch are by M. Lematte. The sketch represents the Vestal virgins flying from Rome. Robed in white, and bearing in their hands the objects of their worship, standing erect in a ponderous car, they form a group rather striking in its austerity; but the people on foot who escort them are barely worthy of attention. In what competitive exhibition would so weak a performance be looked at? The copy proves that M. Lematte is not inspired even by the presence of the great masters. He has chosen, or he has been ordered to reproduce, the kneeling group of bearers of the Pope's chair which is on the right of the Miracle of Bolsena. Raphael would be much astonished if he could see how little character there is in these faces; how little force in the outlines; how little tone in the draperies. This feeble work is destined to add to the famous collection of copies in which so much money has been vested with such deplorable results, in order to persuade the world that governmental machinery is able to reproduce originals; whereas a work of art disdains all literal translation, submitting only to a free enthusiastic interpretation.

M. Luc Olivia Merron announces that his work is not finished. It is a melodramatic composition, the subject or, at least, the title of which is *The Patriot's Sacrifice*. A corpse is laid out upon an altar, at the foot of some steps leading to a temple: on the left Religion holds a pyx, on the right stands Glory blowing a trumpet, in the middle a female figure robed in black giving way to violent grief, a genius holds a tablet on which is inscribed "*Bella matribus detestata*." In the foreground is an uprooted oak and some banners lying in the dust. The whole sketch is wanting in real feeling and the colouring is too indistinct.

The Rape of Ganymede—by a young artist, M. Ferrier—is much more simple and flowing. The young effeminate figure of Ganymede is represented

fast asleep. The eagle is carrying him carefully, supporting one of his legs with its claw. His unfastened girdle is blown about by the zephyrs. The group rises gracefully into the heavens, and the wings of the bird of Jupiter cut a vigorous outline against the sky. The green undulations of the Trojan landscape are also indicated. This would make a good subject for a ceiling, and would require only a little bold foreshortening to fit it for the position. But, good Heavens, neither Michael Angelo, nor Raphael, nor any other Italian master, has the least claim to a share in it. If this picture be remarkable for one quality more than any other, it surely is the entirely modern spirit in which it is conceived and executed! As modern as it is possible for a student who wished not to fail in his engagement or to lose his pension. PH. BURTY.

NOTES AND NEWS.

THE British Museum has just acquired a marble head which Mr. Newton, on his visit to Branchidae in 1872, had pointed out as of the same type as the statues from this spot now in the Lycian Room of the Museum. Several of these statues being headless, it was possible that the head might be found to fit one of them, but such has not been the case. It is in a state of preservation unusually good for sculpture in marble of this extremely early period, and so far it is a valuable acquisition, but its arrival at this moment is particularly interesting from the comparison which it presents to an archaic head and some fragments lately obtained from Ephesus. The Ephesian head, exhibited in the new Elgin Room of the Museum, is finer altogether, but the type is the same, and from this it will be inferred that the style of the Branchidae figures was not of a local character, but prevailed along the coast of Asia Minor for the time.

OWEN JONES, the architect and decorative designer who is more particularly remembered at the present day in connexion with the Great Exhibition building of 1851, and the style of the Alhambra, died a few months ago, generally respected and regretted; and a movement has been started for getting up in his honour "such form or forms of permanent memorial as may seem best." It has been resolved "that a mosaic portrait, in the first instance, be proceeded with, and offered to the nation." A collection of his works has also been opened to public view at the International Exhibition. This comprises 204 items—in the way of architectural or decorative design; works of actual furnishing or adornment—such as chairs, beds, silks, carpets, rugs, wall papering, &c.; some original drawings, in which the artist has not shrunk from treating the human form; studies for the published book on the Alhambra; and minor forms of ornamental production, down to "wrappers for biscuits, designed for Messrs. Huntley & Palmer," and the like. Earnest as he was in study, and high-hearted in work, it cannot be said that Owen Jones realised an absolute success as a designer in form or colour, whether in the architectural or the decorative mode. He represents a transition period, when students were pondering much about principles of decorative art; primary, secondary, and tertiary colours; natural or conventional form in ornament; and much else of the same kind. This may have been, in its time, needful preparatory work. Mr. Owen Jones laboured hard at it, with all good-will, much enthusiasm, and some deserved acceptance; and prepared the way for something that has ensued better than his own—something which could only be supplied by a genuine artist having a capacity for original design, as well as unerring taste in the art of the past.

SOME time ago it was suggested, in the pages of a contemporary, that a change should be made in the collection of prints exhibited on the screens and in the table-cases of the King's Library at the British Museum. The suggestion has not been carried out, but a correspondent expresses the

hope that it may not long be delayed. The present collection—a portion of the munificent bequest of the late Mr. Felix Slade—has been on view for no less a time than five years; and though undoubtedly most carefully selected and possessing great and varied interest, it may be well, urges our correspondent, that it should now, or speedily, give place to another collection, drawn from the infinite resources of the Museum; for, as Mr. G. W. Reid—the keeper of the prints—says in his little preface to the Print-guide, "much that is both interesting and instructive" is now "unavoidably omitted." If it is urged, adds our correspondent, that the change would occasion much trouble and some cost, it should be remembered that no other opportunity than that afforded by the exhibition on the screens and in the table-cases is given to those who would familiarise themselves with some of the best work of the great engravers without special access to the Print-room, where innumerable treasures are lodged in volume after volume. Our correspondent further complains of some practical inconvenience in inspecting the screens as they now stand. Probably owing to the lighting of the gallery, they have been made to slope backwards instead of being perpendicular, and among the great Rembrandts, for instance, the upper of the two rows is much too high to be seen well in this position, unless a man be very tall indeed. Much of the delicacy of the work in several landscapes and portraits exposed is lost; and this, says our correspondent, is notably the case with the exquisite little *View of Amsterdam*, the magnificent landscape called *Cottage, with Dutch Hay Barn*, and the portrait of *Clement de Jonghe*, the printseller. That which should be wholly delightful and instructive becomes a somewhat fatiguing exercise; and if the public is to be educated to take an interest in an unfamiliar art, nothing is more necessary than that it should be encouraged to do so by favourable conditions of sight and comfort.

A CORRESPONDENT writes to us to suggest that during the remaining fortnight the Royal Academy is open, it should not close its doors before eight in the evening, and that its charge for admission should be sixpence, instead of a shilling, and the price of a catalogue sixpence, instead of a shilling also. A capital suggestion, and desirable thing, if the authorities of the Royal Academy could but see their way to adopting it. The reasons which make it desirable are almost too obvious for it to be necessary to mention them. There may, of course, be something to be said upon the other side. Our correspondent might have added that during two days in every week, the Paris Salon is open without any charge whatsoever.

THE Report of the Science and Art Department at South Kensington has been issued this week. With few exceptions, the additions to the Museum by purchase or by gift during the last year seem to have no very striking interest or value. Among the prints acquired is a complete series, now somewhat rare, of curious sixteenth-century woodcuts, forming together what is known as Herold's Basilius or Genealogical Tree, fourteen feet long by four feet and a half wide; a considerable number of early German wood engravings by Schaufelein, Green, &c.; a portion of the series of the woodcuts of the "Great Passion," by Albert Dürer; and a complete series of "The Life of the Blessed Virgin," copied by Marc Antonio from the originals by Albert Dürer. Three packs of old English playing-cards engraved with various subjects have been purchased; these are curious as illustrations of costume, &c., and are now becoming very scarce. To the collection of original drawings of ornament, costume, &c., have been added 243 early drawings of Oriental figures, illustrating the musical instruments as well as the costume of Persia and Northern India; and several important and elaborate drawings of early Christian mosaics by Signors Cenni and Zeri, from originals existing in Italian churches. A fine collection of Spanish glass

vessels of various manufactures, of the sixteenth, seventeenth, and eighteenth centuries, was purchased of Señor Riano, of Madrid; there are 283 specimens in all, and the cost of them was 441*l*. A carved group, representing the judgment of Solomon, in ivory and walnut-wood, by Simon Troger—a German work of the first half of the eighteenth century—was purchased for 680*l*. Of reproductions acquired during the past year, may be noted amongst the more important, a cast of the plaster choir screen of St. Michael's Church at Hildesheim, which dates from the end of the eleventh century, and is an example of an early use of modelled plaster decoration. Electrotypes were also made of the Rhenish Byzantine and Romanesque, and old German metal works to be found in Hildesheim Cathedral. The great cast of Trajan's Column, which, by permission of the authorities of the Louvre, has been made from the electrotyped copy in their possession, is now being erected. The actual height of the column as it stands at Rome has prevented the erection of its fac-simile in one mass, and it has therefore been divided into two parts. In the upper galleries of the museum a series of casts of architectural details of all styles and periods has been arranged.

It is stated that the nett profit realised by the exhibition of the works of Prud'hon, which has just closed, is about 12,000 francs. M. Marcille, who organised the exhibition, will hand over the money to the Society of Artists; and it is hoped that, with a pension to be granted by the Committee, it will enable the painter's daughter to spend the remainder of her days in comfort.

M. CLERMONT GANNEAU has recently addressed a long paper to the French Academy on the subject of a marble bust that has recently been discovered on the site of the ancient Temple of Jerusalem. The bust is evidently not a merely decorative or conventional work, but a portrait, and M. Clermont Ganneau considers it to be the portrait of the Emperor Hadrian, and in this opinion he is supported by the Russian Archimandrite at Jerusalem, and several other *savants*. We know that after the overthrow of the Temple at Jerusalem, a Roman temple dedicated to Jupiter was built on its site, and Christian pilgrims in early times saw the statue of Hadrian within it; but whether the statue now discovered is the one they saw, is a matter for investigation. M. Longpérier, to whom the photographs sent home by M. Clermont Ganneau have been submitted, differs entirely from the Jerusalem *savant* in his conclusions. He regards the bust as being long after the time of Hadrian. That emperor, he points out, had not thick hair, or an aquiline nose, as here represented. The crown of metal ornamented with a cameo that surmounts the head also is seldom met with before the epoch of Julian or Constantine, and is by no means necessarily a symbol of Imperial power. Sacerdotal crowns were often formed in the same manner, and enriched with like ornaments. No doubt we shall hear more from M. Clermont Ganneau on the subject; meanwhile, whoever the bust may represent, its discovery on this ancient site is without doubt interesting.

IN a private letter addressed to M. Ravaissou, M. le Comte de Vogüé announces that he has discovered the first report of M. Brest relating to the Venus of Milo. In this letter, and in several others, it is definitively stated that the arms of the Venus were broken when found, but they prove beyond doubt that the hand with the apple was found with the statue. Whether it formed part of the original composition still remains to be proved; the documents only report the facts of its discovery.

THE Swedish landscape-painter Wahlberg has two pictures now being exhibited in the Salon, with which the French critical press is unusually delighted. We notice that Paul de St. Victor writes in *La Liberté*: "One has but to glance at these pictures to see that M. Wahlberg ranks

among the five or six best living European landscape-painters. He will be the Swedish Hobbema if he fulfils this early promise."

A NORWEGIAN photographer is said to have discovered a mode of galvanically covering living flowers and leaves, recently-dead animals, and other things with a thin film of gold or silver leaf, without altering the form of the object. Very ingenious of him; but what can be the use of his discovery, unless to outdo Shakspeare's climax of what is foolish? Henceforth we must say, "to paint refined gold or *gild the lily*." The same ingenious gentleman has discovered a new and improved method of gilding porcelain. That sounds more practical.

DR. PRUTZ, of Berlin, who has been engaged on behalf of the German Imperial Government in superintending the excavations at Tyre, which are at present being prosecuted at the expense of Prussia and Bavaria, has returned to Germany to report upon his labours in deciphering the inscriptions in the cathedral at Tyre, which dates from the time of the Crusades. Dr. Prutz, as we have already stated, proposes to visit Damascus and Baalbec on his way back to the scene of his labours.

GERMAN historical painting has lost one of its most promising cultivators by the sudden death of Friedrich Spangenberg, who is perhaps best known to the public by his picture of "Genseric, King of the Vandals, leading the Empress Eudoxia and her children into captivity after the sack of Rome," although his reputation was actually made by the great picture which he completed while he was working with the Belgian painter, Professor Pauwel, at Weimar, and which, under the title of *Triumph of the Union*, was intended to commemorate the close of the civil war in America, and had been painted for an American. F. Spangenberg was born at Göttingen in 1843, and received his artistic training in Munich, where he resided till last year, when he obtained, through competitive examination, the subsidy given by the Imperial German Government for two years' study in Germany. It was while he was engaged last month with some other students in an art tour to Pompeii, that he was induced to make the ascent of Vesuvius, in the course of which he was seized with angina pectoris, and died on the spot from the combined effects of over-fatigue and the excessive heat. During his residence at Rome he painted a picture, which is said to have been one of the best he had as yet completed, and which represents a young Ostrogoth entering into friendly relations with citizens of Rome; and at the time of his death he was engaged on a design for a frieze, which was to illustrate in a series of allegorical pictures the political, scientific, and artistic events which have exercised an influence on the destiny of the German Empire.

A HONGKONG paper stated recently that an effort is being made by Mr. Everitt, of the Hongkong Photographic Company, to photograph the remarkable series of pictures in the City Hall Museum, illustrative of the ten Buddhist Hells. It is not certain that their strong and gaudy colours will bear reproduction by photography; but, if successful, the effort will give students of Chinese life an interesting set of illustrations. It is, we believe, proposed to issue them with short letter-press descriptions.

FROM Rotterdam the death is announced of W. Verschnur, a well-known animal painter.

THE rebuilding of the Düsseldorf Academy, which was partly burnt down some time ago, has been determined upon. The new building will not be raised upon the old site, but will occupy a much more advantageous position on the Sicherheisthafen. The architects, Kuerck and Giersberg, both in the Ministry, have been over from Berlin to consult about it, but the execution of the work has been entrusted to Herr Riffarth, whose plans

promise a very fine building, with commodious ateliers and large galleries for artistic collections.

Two magnificent vases in iron repoussé work inlaid with gold and silver are attracting the admiration of connoisseurs in the galleries of M. Goupil in Paris, where they are now being exhibited. They are the work of M. Placido Zuloago, a Spanish worker in metal, who has achieved an almost European reputation by the beauty of his designs and the skilfulness of his execution. These vases are the result of three years' labour, and are said to bear comparison with many works of the same kind of the Renaissance period. They have been acquired, it is stated, by our well-known English amateur Mr. Alfred Morison.

AN interesting contribution to Holbein literature has been made by Herr M. Curtze, who has lately published in the *Beiblatt zur Zeitschrift für bildende Kunst* some important contemporary letters relating to the well-known portraits of Erasmus of Holbein. Professor A. Woltmann (*Holbein und seine Zeit*, page 357) mentions a portrait at Parma, bearing the date 1530, which he thinks probably the original of the little round picture of which we have so many repetitions. These letters refer to a picture of about that date that a certain Joan Dantiscus, Bishop of Culm, apparently wishes to get copied for him by a painter of Mechlin. The first letter is dated "Louanii, 16 Aprilis, 1531." In it the writer says: "Goelenius noster non solum paratus est imaginem quam habet Erasmi, tuo rogatu ad pictorem Mechelinum mittere, sed et donum tibi dare gratum fore putat;" and in two other and longer letters Goelenius, in whose possession the original picture appears at that time to have been, writes himself concerning it. The letters were discovered among the ecclesiastical archives of Frauenberg, and although mentioned by Professor Hipler, who first found them, in *Literaturgeschichte des Bisthums Ermland*, are now published for the first time.

A NEW edition of the catalogue of the Brussels Museum will shortly be published, enriched with numerous etchings and autotypes; the etchings the work, it is stated, of some of the best Belgian artists. This will be a pleasant souvenir to bring away from a visit to that interesting collection.

THE Royal Society of Painters in Water Colours in Belgium is holding its fifteenth Salon. In no country, perhaps, except England, is water-colour painting so much appreciated and practised as in Belgium. This year, according to the critiques, there is certainly no falling off either in quantity or quality in this exhibition, and several pictures of very high merit are spoken of as achieving remarkable results by their technical modes of execution.

THE *Constitutionnel* announces that the receipts of the Salon this year amount to 180,000 frs. This is the largest sum that the exhibition has ever been known to realise. Last year it was 172,000 frs., and in 1872 only 166,000 frs. The last day of the Salon (it was kept open one day over the date officially announced) was very crowded.

THE works at the Hôtel de Ville in Paris are being carried on again with great activity. More than two hundred workmen are employed in demolishing the ruins left by the fire.

THE *Gazette des Beaux Arts* this month is again greatly taken up with the Salon, which is being criticised in detail by M. Louis Gonse. An article also on the water-colours, drawings, and engravings in the Salon, by M. Paul Leroi, calls attention to works that are but too likely to be overlooked in such an overpowering collection; but never, we are told, has this section presented "un plus vif intérêt." The illustrations to these two critiques are numerous and excellent, being mostly taken from the painters' own sketches for their pictures.

The other articles of the number are chiefly continuations. Charles Blanc continues his

"Grammaire des Arts Décoratifs," and discourses philosophically on the apparent vagaries of fashion in dress, which he considers "loin d'être un sujet d'observations frivoles; le vêtement et la parure sont pour le philosophe une indication morale, et un signe des idées régnantes." M. Albert Jacquemart gives us a second notice of the exhibition of the Palais Bourbon; M. Paul Mantz a fourth and last article on the Suermondt collection; and M. René Menard a second article on Paul Baudry, with more illustrations from his works for the new Opera House. An obituary sketch of the late M. Beulé, by A. Gruyer, deals chiefly with Beulé's connexion with the Académie des Beaux Arts, of which he was perpetual secretary. The various "Eloges" that he pronounced in this capacity are abstracted and reproduced. An excellent portrait by Paul Baudry, which accompanies the notice, represents a handsome intellectual-looking man in the prime of life.

A fine etching by Waltner of the picture by F. Humbert of the *Virgin and Child and Infant St. John*, which has created so much sensation in Paris, gives additional pictorial attraction to an already rich number. The picture is conceived in the manner of the early Italian painters. The Virgin and Child with solid glories round their heads are seated beneath a canopy with a landscape background on either side. The Virgin looks older than she has usually been represented since Byzantine times, but the Child is very beautiful. *The River*, by Hobbema, from the Suermondt collection, is also etched by Leopold Flameng.

THE STAGE.

"LITTLE EM'LY," AT THE MARYLEBONE THEATRE.

MR. EMERY has been appearing, during the week, at the Marylebone Theatre, in Church Street, out of the Edgware Road, where a theatrical enthusiast may have the temerity to follow him. One must not always judge of the value of a thing by the price that is charged for it: the price of an orchestra stall at the Marylebone Theatre is a single shilling, and the reader who pays it may lament that in his time he has paid seven for a worse entertainment. It would be a mistake to confuse the Marylebone Theatre with those popular playhouses in the Borough and at the East End, of which tradition asserts that there are constant interruptions of the performances, and that the effect of the fine art upon the stage is somewhat marred by the uncontrollable enthusiasm of the audience. At the Marylebone Theatre, order reigns. The occupants of the stalls appear to belong almost to the class of society from which are drawn the frequenters of the pit at our leading theatres for comedy, such as the Haymarket and the Vaudeville. The Marylebone pit holds those who would be the occupants of the Vaudeville gallery, and the Marylebone gallery holds those who are altogether strangers to a West End Theatre—those for whom comedy has no attraction, because it is trifling and insincere; those who think nothing of a piece which makes no call on their emotions; and who, whatever they may be individually, are collectively devoted to virtue in its purest form.

This audience is by no means inappreciative of such a drama as *Little Em'ly*—Mr. Halliday's stage version of *David Copperfield*. Peggotty's pathos and Micawber's extravagant speechifying are alike relished; and though of course the play is not presented with the completeness that distinguished its performance at the Olympic, it is probably played quite as well as it would be in the leading theatre of a provincial town of the second order—Portsmouth, say, or Plymouth. *Little Em'ly*, like *Heart's Delight* (Mr. Halliday's version of *Domby*), has two entirely separate threads of interest; and in an adaptation from the character-crowded works of Dickens this is not to be wondered at—it is rather perhaps a matter of surprise that the course of the drama does not run over lines of interest more numerous

and more widely severed. The fortunes of Peggoty and the fortunes of Micawber—these are as independent the one of the other as the fortunes of Mr. and Mrs. Dombey are independent of those of Captain Cuttle and his young friend Walter. To the interest of the drama, as of the novel, Peggoty contributes the pathos, and Micawber the fun. No one is a better actor of rough pathos than is Mr. Emery—the pathos which is entirely natural and human; neither intensified nor refined, and suppressed by the sensitiveness of culture—*le mal du dix-neuvième siècle*. A great, burly, affectionate, hearty, honest, uneducated man—generally a sea-faring man with an unsteady walk on shore, and capacious trousers and a telescope—that is the type Mr. Emery is most successful in presenting. And his Peggoty has in truth much in common with his Captain Cuttle: perhaps, indeed, it is Captain Cuttle minus the iron hook and the admiring belief in stupid Jack Bunsby. Certainly Mr. Emery, though always worth seeing, is less worth seeing in this piece than in the other. The piece itself gives him far less opportunities for character and pathos. There is less individuality in his part, as Dickens conceived it and Mr. Halliday dramatised it. The greatest praise that can be given to Mr. Emery is that without being exceedingly various, he is nearly always very real. But once, in *Little Em'ly*, there is a sense of unreality about his part. In follows closely on the coming of the news that Little Em'ly has gone away—news which he receives with a voice of deep hopelessness and gesture of profound trouble. He is going out, then, he says, to seek for her, and bring her back from her shame. (The gallery is quite properly enthusiastic and delighted at the announcement of his intention.) But first of all he is going (as far as our correspondent is able to understand) to drown the boat of the betrayer, which is on the shore, and then he is going over the wide world, and will bring Little Em'ly back. This unnatural business about drowning the boat, he speaks as if he is very anxious that Ham shall thoroughly believe it. For a minute (and remember, it is only two minutes ago that he has heard of Em'ly's flight) the sorrow of Em'ly's flight weighs less with him than his anxiety to drown the harmless boat. At such a moment, wouldn't he be wholly engrossed with his search? Or, indeed, he might drown the boat in passing; but he would hardly stand up in the ark on Yarmouth sands and seriously persuade the deserted lover Ham that that was the unique pre-occupation of his mind. Then at last he goes out, and "the pity of it, Iago; the pity of it" strikes him suddenly, and he leans against the door, and the curtain falls as he is thus overcome; but the transition from bravado to overwhelming sorrow is too quick to be natural; or rather, the bravado having been unnatural, the overwhelming trouble seems scarcely natural too.

The general acting of the company may perhaps be a little colourless; but it is in no sense coarse. Mr. F. Marchant, who appears to be a popular low comedian, acts Micawber with infinite energy. Assuredly he is not very subtle, but it must cost something to be energetic, on a July night, in the heart of Marylebone. Perhaps it is a mistake of Mr. Marchant's, when Heep has struck Micawber, to make Micawber still declamatory, rather than excited. Mr. C. A. Clarke acts Ham—the fisherman-lover—with intelligence. He is not stilted when expressing his emotion. He reads a letter as if he had just received it, and not as if he knew it by heart—a stage-accomplishment which, outside Marylebone, might very advantageously be imitated. Mrs. Clarke misses the acidity of Betsy Trotwood. The character of Rosa Dartle seems even more exaggerated and detestable when seen upon the stage than when read of in the book. An audience can hardly endure the scene in which when Little Em'ly has come back to the Yarmouth home, Miss Dartle seeks entrance there, and upbraids her, and, while she is on her knees, flings her from right to left as if she were no

human creature at all, but a thing taken from the mud, to be the toy of an hour. The representative of Miss Dartle—Miss K. Neville—acts the part with some force. But the best bit of acting amongst the ladies here is that of Miss Emma Barnett, when, in the Canterbury churchyard, as the outcast Martha, she finds the true tone for her wail and cry of misery. That, and a good deal beside it too, is good enough to be heard beyond the borders of Marylebone.

FREDERICK WEDMORE.

Phidre and other plays have this week been substituted for *Les Horaces* at the St. James's Theatre; and morning performances have very wisely been instituted there.

Ours is the comedy of T. W. Robertson's which has this week been performed at the Standard Theatre by the company organised to act Mr. Robertson's plays in the provinces and the outlying districts.

AT Mdlle. Rose Bell's benefit, a new operabouffe called *The Silver Cage* is, we are informed, to be represented. Its libretto is by a new writer.

OPERA-BOUFFE will be performed at the Lyceum during the months of August and September.

SALVINI, the Italian actor, has been making a great impression in New York in Alfieri's tragedy, *Saul*.

MR. IRVING sojourns at Endcliffe, Henbury, Gloucestershire.

Mdlle. SARAH BERNHARDT makes a short stay at Royat, Puy-de-Dôme.

M. GEORGES D'ILEYLI is about to publish, through Tresse, a Paris bookseller, a little volume on the Théâtre Français, from its foundation, in 1680, to our day.

DENTU has just published the fourth volume of the works of Scribe. It contains some of his best work—*La Camaraderie*, *La Passion Secrète*, and *L'Ambitieux*. Of these, the first is the only one now forming part of the repertory of the Théâtre Français, and during the present summer it is to be acted there. *La Passion Secrète* contained a good part for old Samson; and though its style is quite out of the fashion, it is still not very dull to read.

Two new pieces have been performed in Paris, of which the more important is *La Chute*, by M. Louis Leroy, one of the wittiest contributors to *Charivari*. It is acted at the Théâtre du Gymnase. Mdlle. de Vandeuil, whose husband is a man of low life—extravagant, a gambler, and very often drunk—accepts a *rendez-vous* at the house of M. de Montreux, a bachelor, and goes to it with intentions as innocent as those of Lady Teazle when she called on Joseph Surface. M. de Montreux makes love to her, and she is going away, when, her husband suddenly appearing, she, in confusion like Lady Teazle's, gets behind some tapestry, and there she hears her lord avow that being now impoverished he is going to seek new fortune in the East. Why in the East? Because there goes that way a young English woman whom he adores. No sooner has the husband gone than Mdlle. de Vandeuil, stung by his avowal, rushes out from her hiding place, and accepts the protection of her bachelor friend. The two live together quite publicly as man and wife; but the bachelor is somewhat too speedily enamoured of one Carmina, a woman of bad life, who is intriguing for a certain weak-minded Baron to marry her. So Mdlle. de Vandeuil finds—which is probably the most instructive point in a play not wholly edifying—that if a husband can be inconstant, so can a lover be too; and what with these two infidelities, she is reduced to loneliness and shame, and even Carmina insults her, at a ball at Nice, and her protector is no other than her husband. For M. de Montreux, himself in love with Carmina, though

the Baron is in the way, does not resent the insult bestowed on a woman who had braved for him all that Society could say. Late in the day, the husband, who, after his own career in the East, had not perhaps very much reason to interfere, provokes and challenges M. de Montreux; and in the duel he himself is slain, and he dies with a mournful reflection for his wife—"quel avenir!" he says. With this the play ends. The greatest fault is, not that it has not got a "mission;" but that what is meant to be a dramatic transcript from the darker pages of actual life is too full of improbabilities. Here and again one is pulled up to ask oneself, Is there adequate reason for this and that complication—this and that folly? But many of the scenes are effective, and those which are comedy (Carmina's scenes especially) are written with boldness and wit. A secondary character—that of the foolish Baron—is the most original, while Carmina is the most audacious. Landrol acts well as the husband, and Mdlle. Angelo pretty well as Carmina. Mdlle. Fromentin is a little too cold and stiff and accurate to be a good representative of Mdlle. de Vandeuil. But on the whole the piece is indulgently received. It deals, it must be admitted, with very unsavoury matter, without any adequate reason.

THE second new play in Paris is a four-act drama by Mdlle. Louis Figuier, performed at the Théâtre de Cluny and called *L'Enfant*. Mdlle. Louis Figuier is a woman of Society, and she finds it easy to have her pieces played, even when there is not much in them. The scheme and action in *L'Enfant*, whose story we do not hold ourselves obliged to narrate, are not specially subtle or refined. Rather the other way. But the action is interrupted by *naïve* remarks, the expression of aspirations which do credit to the authoress. It is a misfortune that they remain in prose. They are of the kind to make very passable second-rate verse, and ought, as M. Francisque Sarcey says of them, "s'exhaler en alexandrins vers les cieux." The chief character is carefully acted by Mdlle. Lacressonnière, to whose performance in *Les Deux Orphelines* that tear-compelling drama owed part of its success. The Théâtre de Cluny has not lately been very fortunate.

MUSIC.

LAST Saturday's concert at the Crystal Palace was devoted to the exposition of Scandinavian music—Danish, Swedish, and Norwegian composers being represented. If the North of Europe has as yet given us no Beethoven, it can at least produce musicians of whom their country may justly be proud. Among Danish composers Niels Gade occupies the first place. While he may be in general spoken of as belonging to the Mendelssohn school, he is by no means destitute of originality of idea. Three specimens of his music were furnished on Saturday. The first was his overture, "Im Hochland," entitled by its author a "Scotch" overture, in which some of the peculiarities of the national rhythms and melodies of Scotland are imitated with happy effect. The very pleasing, though less original, chorus, "Spring's Message," was the second illustration of Gade; the third being a particularly quaint little song entitled "Polsk Fædrelandssang," well sung by Mdlle. Holmberg. Another Danish composer, Emil Hartmann, was represented by his overture to *The Erl-King's Daughter*, which was performed on this occasion for the first time in England. The overture is a very pleasing and well-written piece of music, though not one which displays any very great originality. Far more interesting as novelties, because far more individual in character, were the specimens of the two young Norwegian composers, Grieg and Svendsen. The former was represented by his pianoforte concerto in A minor, first produced at the Crystal Palace at the last season of winter concerts, and noticed at that time in these columns (see

ACADEMY, April 25). As on the previous occasion the solo part was admirably played by Mr. Dannreuther; but, owing to want of sufficient rehearsals, the accompaniments fell short of the finish to which we are accustomed at the Crystal Palace. Notwithstanding this, however, the beauties of the work are so great that its success was as decisive as at the first performance. Another most interesting novelty was the scherzo from J. S. Svendsen's symphony in D. This movement is both in ideas and treatment intensely original, and we trust that Mr. Manns may next winter bring forward the complete work. The performance of the movement was most admirable; and this is the more to the credit of Mr. Manns and his band, as we happen to know for a fact that the music did not reach the Crystal Palace from Germany till the Wednesday before the concert. The remainder of the programme calls for little detailed notice. It consisted chiefly of national melodies, sung by Mdle. Enequist, Mdle. Holmberg, and Herr Conrad Behrens, as well as the Danish national song "Der tappr Landsoldat," and the Norwegian national song "For Norge," in which latter many of the audience were doubtless surprised to recognise Pearsall's well-known part-song "The Hardy Norseman."

THE Philharmonic Society brought its season to a close last Monday evening, with a programme consisting almost entirely of well-worn pieces. Among the interesting novelties, or quasi-novelties, brought forward during the series of concerts now concluding were Handel's Grand Concerto in A for strings, Brahms's Serenade in A, Lalo's violin concerto, and Rheinberger's overture to the *Taming of the Shrew*. On the other hand, the unfulfilled promises include Lachner's Suite in D, Sir Sterndale Bennett's *Ajar* music, and Raff's "Lenore" Symphony. The non-performance of the last-named work is the more to be regretted as we believe none of Raff's symphonies have yet been heard in London, though, if we are not mistaken, Mr. Hallé has produced his "Im Walde" ("Forest" symphony) at the Gentlemen's Concerts at Manchester. A word of recognition is due to the marked improvement of the band under Mr. Cusins in the course of the season—the later concerts showing an amount of finish and refinement which were painfully wanting in the earlier ones.

M. THÉOPHILE LEMAIRE has just published at Paris a French translation of *The Art of Singing* by Pierfrancesco Tosi, an Italian musician of the seventeenth century, which is said to be, if not actually the oldest work on singing, at least the first in which the art is treated from an elevated point of view. The author complains that all previous works only treat of the first elements. The work is reviewed at some length, and on the whole very favourably, in the *Temps* of the 14th inst.

It is announced by the Leipzig *Signale* that Mdme. Nilsson will appear next February at the Hofopertheater in Vienna, and will sing there for the first time in the German language.

It may not be uninteresting, says the same paper, to learn something of the demands made by great artists. It was desired to engage Mdle. Marimon for St. Petersburg and Moscow, and her terms were asked. The following was her reply. 1. No commissions to agents. 2. 20,000 francs per month. 3. Ten appearances in a month guaranteed. 4. Never to sing on two consecutive evenings. 5. The choice of parts to be left entirely to myself. 6. Travelling expenses for two persons. 7. Two benefits, one in Petersburg and one in Moscow. 8. Costumes which are to be prepared in Paris.

FRANZ BENDEL, who since Tausig's death has been the most distinguished pianist in Berlin, died of typhus fever on July 3, at the age of forty-nine.

A RECENT number of *Dwight's Journal of Music* contains a detailed criticism of Mr. John K. Paine's new oratorio *St. Peter*, recently produced at the third Triennial Festival of the Handel and Haydn Society in Boston, evidently from the pen of an experienced musician, and written in the quasi-colloquial style so much affected by the American press. The critic's general estimate of the work is summed up in his concluding paragraph, as follows: "Upon the whole, we do not feel entirely sure of all our own impressions of *St. Peter*, and we prefer to leave to time, at all events, the question of its *genius*. But that it is a thoughtful, musician-like and earnest work; that it shows dramatic power in many passages; that it is full of feeling in some parts, if it is dry and over-wrought in others; that it is free from all slavish imitation, and conceived and executed in the man's own way (if sometimes to a fault); that we find more in it to like—more at least to justify itself to cool examination; and that the chorus singers and audience, when they sang in it and heard it as a whole, liked it a good deal better than they ever thought they should—we can with confidence report. At all events, respect is due to the first earnest effort on so great a scale, and giving such proofs of ability, by an American composer who is yet a young man."

THE impresario proposes, and the composer disposes! We learn that Mr. Gye's intended performance of Verdi's "Requiem," announced in last week's ACADEMY, will not take place, as the composer declines to allow his work to be produced at a time when both soloists, chorus and orchestra have been "over-fatigued" by six performances a week.

POSTSCRIPT.

THE *Daily News* states that Earl Russell is about to publish a volume entitled *Recollections and Suggestions of Public Life, 1813-1873*.

WITH reference to the letter of Mr. Clements Markham appealing for subscriptions to the Fund to meet the expenses of Lieutenant Cameron's expedition, to which we called attention in our last number, there is one point that has been raised by Mr. T. Livingstone in his letters to the *Times*, and that a most important one, which we are in a position to settle. The son of the great explorer for whose succour Lieutenant Cameron risked his health and life, and in whose service he gallantly undertook the journey to Ujiji, endeavours to make out that the papers left by Dr. Livingstone there were of no great value, that the country between Unyanyembe and Ujiji was perfectly safe, that a part of Livingstone's negro servants could have performed the journey as easily as the English officer, and hence that Cameron has done no service.

We are able to contradict the whole of these statements. The map left by Dr. Livingstone at Ujiji, which Lieutenant Cameron has now recovered, is of very great value. It is a map of the entirely unknown region from Kitanguli on the coast to Lake Nyassa, and without it the records of Dr. Livingstone's discoveries would be very incomplete. By its recovery Lieutenant Cameron has performed an important service to geography, for which he deserves and will receive warm thanks from his countrymen, if not from the son of the great explorer for whom he has done and suffered so much. Lieutenant Cameron found the country between Unyanyembe and Ujiji in a more dangerous and disturbed state than it has ever been before. Mirambo was very powerful, and his followers were well armed. He was devastating the country in all directions, and was within a few miles of Lieutenant Cameron at the Malagarazi Ferry, who saw several of his men. Besides Mirambo there was a colony of runaway slaves right across the route, armed with muskets, which attacked and plundered

all native parties. An English officer, with tact and judgment, like Lieutenant Cameron, was not molested and could obtain supplies. But no large Arab caravan has passed for years. Mirambo's followers declared that any armed party of negroes or Arabs would be attacked or driven back; and the people said that they would rather destroy their food than give it to such invaders. Single messengers or small parties may pass to and fro with letters and parcels, but not without risk. It is very clear that, as things stood, Livingstone's journal and map could not have been recovered if Lieutenant Cameron had not undertaken the journey to Ujiji.

The attempt to injure Cameron by insinuating that he did not give essential aid in forwarding Livingstone's body and effects to the coast, will also recoil on those who have made it. The fact that he did give such aid is capable of absolute proof; which will no doubt be produced by Lieutenant Murphy, who has arrived in England.

Lieutenant Cameron is now on the verge of important discoveries; and it will be a disgrace to this country if he is left to his fate, or even checked for want of funds. We trust that the appeal for subscriptions will be promptly and generously answered.

AMONG the latest items of intelligence from Oxford are the following announcements:—

"The Governing Body of Christ Church have voted the sum of 100*l.* per annum for five years in aid of the Biological Department of the Museum.

The Provost and Fellows of Worcester College have voted the appropriation of 2 per cent. of their revenues to non-Collegiate University uses; and have resolved that this sum for the next five years shall be paid in equal proportions to the Bodleian Library and the University Museum."

The plan adopted by the junior and less distinguished society has obvious advantages over the other, being a more explicit recognition of the claims of the University, and leading to a more regular supply. Perhaps it would have been better, had the Provost and Fellows of Worcester specified some special object connected with the Bodleian, such as the publication of *Notices et Extraits* on the Paris plan, with which their name might be honourably connected.

THE GAME LAWS.

The Game Laws. By G. Shaw Lefevre, M.P. (London: Ridgway, 1874.)

"SWEET are the uses of adversity," which members of the ousted Liberal Ministry generally may, like Arden's banished duke, discover to "wear a precious jewel in his head," if they will but avail themselves as judiciously as Mr. Lefevre is doing, of the leisure afforded by temporary exile from office. Now is their time for calmly thinking out political problems which otherwise, on reassuming the ministerial reins, they will have to solve without much more thought than how most easily to get rid of them; now the time for youthful aspirants amongst them to qualify themselves for advancement; now the opportunity for a clever ex-Secretary of the Admiralty to establish a fair claim to reversion of the Home Secretaryship, by mastering such questions as the one which we here find investigated. Within the space of some eighty fluently written and pleasantly readable pages, Mr. Lefevre has summarised the history of the Game Laws, expounded their principles or want of principle, exhibited their bearings and exposed their defects, discussing withal the sort of amendments they seem to him to require. He has, in short, in spite of the inadequacy of some of his conclusions, produced a tract not unworthy to be recommended to general acceptance as a serviceable Game Law Reformer's Manual.

The absolute monopoly of venery arrogated by our early Norman monarchs is scarcely sufficiently explained by that ardent passion for the chase which, from the days of Nimrod to those of Albert Edward Prince of Wales, has ever been a characteristic attribute of royalty. Mighty hunter before the Lord as he was, William the Conqueror might well have been content with something short of an entire kingdom for a hunting-field. Albeit, according to the Anglo-Saxon chronicler, "loving tall stags as if he were their father," he might yet have found full scope for his paternal affection by turning half a county at a time into a New Forest, without ordaining that whoever else than himself throughout the length and breadth of the realm should cast killing glance at hind or hart, should lose his eyes. Mr. Lefevre, overlooking for the moment the primeval English yeoman's unrivalled prowess with the long bow, suggests that the outrageous imperiousness of the Conqueror's forest laws may have been dictated by desire to keep arms out of the hands of the conquered natives; but an explanation, at least equally probable, is that the prerogative asserted by those ukases was valued, not merely for the sake of its solid advan-

tage, but also as a symbol of sovereignty. Even before the barbarians by whom the western parts of the Roman Empire were overrun had emerged from their native wilds, it is likely enough that, as cattle and sheep multiplied and game proportionably decreased, a wealthy herdsman at the head of a clan permitted few of his retainers to accompany him to the chase except as beaters and drivers. Even thus early, to hunt might come to be regarded as a distinctive privilege of supremacy, and to hunt without permission as a species of *lèse majesté*; and both the privilege and the treason would be more sternly insisted upon after the chief of a clan had, as general of an invading army, subdued a Roman province and proclaimed himself its king. As that tissue of legal fictions to which the name of Feudalism was eventually given became gradually woven, the ingenuity of obsequious lawyers successfully exercised itself in showing cause why rights of chase ought to be *de jure*, as they already were *de facto*, vested solely in the Crown. Their fundamental position was that all land had originally belonged to the King, and had by him, of his own mere motion, been graciously parcelled out among his vassals, of course on his own terms; while an auxiliary argument was that *ferre naturae*, since *ex vi termini* belonging to no one else, must of necessity belong to him. Besides, as one early legist added by way of clincher, "Wild beasts of venery and beasts and fowls of chase and warren, being things of great excellency, are meetest for the dignity of a prince for his pastime and delight, and therefore do most properly belong unto the King only." Now, what in most other countries had been only an impudent fabrication, was in our own a stern reality. The partition of England was actually effected on the legal principles aforesaid. The greatest barons did accept their shares as tenants holding of the Conqueror, who therefore, as between himself and them, was guilty of no very manifest injustice in treating the entire realm as one manor whereof he was sole lord, and in reserving to himself, and to such persons as he might delegate, the exclusive right of chase over everybody's land. But though this might be no injustice, it speedily was felt to be an insupportable grievance. The Anglo-Norman barons and other great landowners, being as fond of hunting as their kings, and keenly feeling too the degradation of being debarred from it, did not rest until they had wrung from Henry III. a *Charta de Foresta*, which in their eyes, not impossibly, stood in the relation of *Charta Major* to the *Magna Charta*, on which it speedily followed. Thereupon, the Crown's exclusive prerogative was virtually, though not formally, abandoned, and its monopoly of venery broken up into fragments, which, however, were forthwith appropriated by the nobility and higher gentry, and exercised with but little abatement of the previous regal rigour. Fortunately, in this island, aristocratic insolence has always been tempered by a wholesomely prosaic respect for wealth, concomitant with, and counterbalancing, pride of birth, so that, whereas in France and Germany all persons below the rank of seigneur were forbidden under severe penalties to kill game, in Eng-

land the liberty of so doing was made dependent, not on armorial quarterings, but on annual income, and was by 13 Richard II., cap. 13, extended to all laymen having lands or tenements to the value of 40*l.* by the year, and to any cleric advanced to the value of 10*l.* by the year. Still, whatever his property qualification, a freeholder did not, until Queen Anne's reign, presume to claim the right of shooting or coursing, even over his own fields, unless the manor in which his land lay were also his, nor did copyholders—inheritors as they were deemed of all the "original baseness" of mere villein tenure—succeed in usurping the same right until more than a century later, the lord of the manor meantime engrossing all sporting privileges within its limits. As for mere tenant farmers, they were held to be absolutely disqualified, and to be no otherwise concerned with game than by the obligation to rear it at their proper cost and charges for the diversion of their territorial superiors. Moreover, in order apparently to obviate pecuniary temptations to poaching, the sale of game was absolutely forbidden and severely punished. Laws like these, passed as if on purpose to be broken, lead inevitably to the breaking of moral laws as well as of themselves; but it was much less their demoralising tendency than their proved inefficacy, which occasioned the repeal in 1831 of the till then existing Game Laws. As Mr. Lefevre pertinently remarks, the second *Charta de Foresta octroyée* in that year was the concession of an unreformed Parliament: otherwise it might perhaps have contained provisions sufficiently liberal to anticipate the crying necessity which has since arisen, and is now so loudly resounding on all sides, for a third Forest Charter. As it was, it did as much of harm in some respects as of good in others. It made indeed a clean sweep of privilege and of property qualification, except in so far as it restricted the abstract right of shooting to such as could afford to take out licences; it legalised the sale of game, and it recognised in all tenant farmers, against whom the right was not expressly reserved by their landlords, the right of shooting over the lands they held. But, on the other hand, it has caused this right to be almost universally reserved, and, what is fifty times worse, it has led to an immense extension of the baneful and hateful practice of letting the shooting apart from the land; it has promoted the preservation and multiplication of game to a degree rendering it a perfect agricultural pest; and it has, by vastly augmenting the temptations to poaching, augmented proportionably the number of poachers, insomuch that in England and Wales alone, without reckoning the sister kingdoms, some ten thousand of them are annually convicted and either fined or sent to prison, to keep company there with thieves and garotters, and come out emulous graduates in crime. That, in doing all this, it has added largely to the causes of dissension already existing in sufficient abundance between landlords, farmers, and farm labourers, *va sans dire*. This portion of his subject is discussed by Mr. Lefevre with much fullness of detail, with discriminative acuteness and perfect fairness, and generally

in a spirit which leaves little to be desired until we arrive at his practical recommendations. Then, indeed, the contrast between his inferences and his premisses disagreeably reminds us of the mountain's mousey parturition. Here, in his own words, are his prescriptions for the social and national evils in whose diagnosis he has shown himself so skilful:—

"1. The severance of the right of sporting from the occupation of land should be confined to winged game; and contracts for the reservation of hares and rabbits should be declared illegal as between landlord and tenant.

"2. The penalties under the Night Poaching Act should be reduced.

"3. The Poaching Prevention Act of 1861 should be repealed.

"4. The police should be prohibited from acting in any way as game preservers.

"5. The law with reference to damage caused by undue multiplication of game, and especially of rabbits, to the crops of adjoining owners or occupiers, should be carefully reviewed and placed on a more satisfactory footing.

"6. The right of sporting should be made incapable of permanent severance from the ownership of land.

"7. Power should be given to landowners to redeem the right of sporting over their lands, where now permanently severed from them, upon payment of an amount to be decided by a jury."

Laudably desirous as Mr. Lefevre evidently is of steering a middle course between total repeal and entire maintenance of the Game Laws, not less evidently is he here hugging the land much too fondly, heedless of the Horatian caution against *nimum premendo litus iniquum*. No doubt, total repeal, unless accompanied by a new trespass law of intolerable harshness, would, in a country so populous as ours, speedily eventuate in total extermination of most kinds of game, a consummation devoutly to be deprecated by all, and notably by kind-hearted philozoists. This must be clear to any one who, in a country where whoever lists may shoot at whatever he can find, has trudged over hill and dale in the vicinity of a large town, without getting, from dawn till dusk, one single shot except at a stray woodcock or wild duck. Total repeal then is not seriously to be thought of; but what short of total repeal would meet the necessities of the case, the present writer pretends not to determine, although not without an opinion of his own on the subject, which he modestly believes to have at least the merit of simplicity. The legislation which he, with all diffidence, would advocate, would consist in simply declaring game to be the inalienable property of the occupant of the land on or over which at the time it happened to be—property so absolutely inalienable that any agreement for its transfer to the landlord should be *ipso facto* null and void. Every tenant farmer in the kingdom would then become interested in the due preservation, though remaining as hostile as ever to the undue multiplication, of game. Of course, there would be an end of battues and all such cold-blooded butchery in hot corners, and whoever desired sport would, *nolens volens*, have to enhance its zest by taking exercise with it: but sport enough any landlord might have who was wise enough to cultivate kindly relations with his tenantry. An additional set-off, too, against the cessa-

tion of battues would be the cessation of poaching, both amateur and professional, since, against the vigilance of the new class of interested gamekeepers proposed to be called into existence, professionals would have little chance, and amateurs, in so far at least as recruited from farm labourers, next to none. Upon these hints it would be easy to speak much more at large, for antagonism between the interests of the many and the amusements of the few is an inexhaustible theme; but, even without further speaking, they may not impossibly find favour in Mr. Lefevre's eyes, seeing that, although not drawn by himself, they are legitimate deductions from his own facts and reasonings.

Mr. Lefevre winds up with a few observations on the "merit of the institution known as sport," but little would be gained by following him into this branch of the subject. It is one in which compromise is scarcely possible between the select minority who have learnt the Wordsworthian lesson

"Never to blend their pleasure or their pride
With sorrow of the meanest thing that lives,"

and the tyrant majority who, refining on the sentiment expressed in a well-known couplet of Pope's, ending with "well-fed goose," seem to think that all living things are meant for man's abuse. The national taste must indeed be changed before it will be possible for the morality of sport to come on for trial, with the English public for jury, without much the same result as when on a recent occasion Miss Helen Taylor and Mr. Edward Freeman, for the prosecution, had much the best of the argument, but Mr. Anthony Trollope, for the defence, carried away nine-tenths of the votes.

W. T. THORNTON.

The Dramatic Works of Thomas Heywood.
In Six Volumes. (London: John Pearson, York Street, Covent Garden, 1874.)

(Second Notice.)

THOUGH not a lyrist in any high sense of the word, Heywood at times produced songs remarkable for purity and freshness. To one of these in the *Fair Maid of the Exchange* I have already called attention. Not less beautiful is a morning ditty, which begins "Pack, clouds away," in the *Rape of Lucrece*. The patriotic war-song in the First Part of *King Edward IV.*, "Agincourt, Agincourt, know ye not Agincourt?" is full of fire; while a humorous catch, "The Spaniard loves his ancient slop," must have been a favourite with the groundlings, since it occurs in both *The Rape of Lucrece* and *A Challenge for Beauty*. There is plenty of proof that Heywood could write good words for street melodies, and that he was no less ready with popular *cochomerics* than Offenbach. That his English style is generally free, flowing, and vernacular admits of no question; yet such were the contradictions of the age in which he lived, that he must needs at intervals display his erudition by the pedantic coinage of new phrases. Such words as "trifulk," to "diapason," "sonance," "cathedral state," "tenébrous," "mœchal," "monomachy," "obdure" for "obdurate," all of which occur in *The Rape of Lucrece*, demand for their inventor the emetic which Jonson in the *Poetaster* administered to Mar-

ston, and prove conspicuously how a little learning on the lips of an honest playwright is a dangerous thing.

The Rape of Lucrece, as I have before hinted, is nothing but the narrative of Livy divided into tableaux with no artistic consistency. It contains the whole story of Tullia's ambition and the death of Servius, the journey of Brutus to Delphi, the fulfilment of the oracle, the betrayal of Gabii, the camp at Ardea, the crime of Tarquin, the rising of the Roman nobles, the war with Porsena, and the stories of Horatius and Scevola. The characters are devoid of personal reality. Lucrece herself is more a type of innocence than a true woman. Yet the real interest of the drama gathers round her; and the open-eyed insane self-abandonment of Tarquin to his lust is well portrayed. The most touching scene in the whole play is one which opens the fifth act. The rape has been accomplished; Lucrece, who has summoned her husband from the camp, is sitting alone with her maid Mirable in expectation of his coming and her foreseen suicide. The girl sees her weeping, and asks the reason of her sorrow. Then Lucrece gives vent to passionate exclamations, appealing in the highest against heaven:—

"Oh, you powerful gods,
That should have angels guardant on your thrones,
To protect innocence and chastity! oh, why
Suffer you such inhuman massacre
Of harmless virtue? Wherefore take you charge
Of sinless souls to see them wounded thus?"

Still she does not discover the cause of her grief, and Mirable continues:—

"Alas! what troubles you?
Lucr. I am not sad; thou didst deceive thyself:
I did not weep; there's nothing troubles me:
But wherefore dost thou blush?"

Mir. Madam, not I.

Lucr. Indeed thou didst,
And in that blush my guilt thou didst betray;
How camest thou by the notice of my sin?"

There is great truth to nature in the intolerable isolation Lucrece feels, her desire to conceal her disgrace, and her inability to keep from fretting over it, which ends in the suspicion that all the world must know how she has fallen. Afterwards, when Collatine and the Roman lords arrive, her description of Tarquin as

"that unprincely prince
Who guest-wise entered with my husband's ring,"

sounds the true note of dramatic poetry. It sums up in a sentence all the circumstances that enhance the villany of Sextus. Of the minor characters which fill out the play, by far the most original is Valerius. His part must have been a favourite with the London audience, for on the title-page we read: "with the several songs in their apt places by Valerius, the merry lord among the Roman peers." Instead of fooling, sulking, or gaming, as the other nobles do beneath the Tarquin tyranny, he does nothing but sing. It is impossible to extract from him a word of sense in sober prose. But love songs, loose songs, drinking songs, dirges, street cries, a Scotch song, a Dutch song, and pastoral ditties, with rhymes on the names of public houses, public women, ale, wine, and so forth, flow from him in and out of season. He is the most striking instance of the licence with which the poets of the time were forced to treat their subjects

for the sake of the gallery. Some of his verses are full of exquisite feeling; others are grossly coarse; some are comical, and others melancholy; but all are English. When Valerius first hears of the outrage offered to Lucrece, he breaks out into a catch of the most questionable kind, together with Horatius Cocles and a Clown. The whole matter is turned to ridicule, and it is difficult after this musical breakdown to read the tragedy except as a burlesque.

Love's Mistress is a Masque in five acts rather than a play proper. In its day it enjoyed great popularity, for it was represented before James I. and his queen three times within the space of eight days. Its three prologues and one epilogue are remarkable even among the productions of that age for their fulsome flattery. The story of Cupid and Psyche, on which the Masque is founded, could not have failed to yield some beauties even to a far inferior craftsman than Heywood; and there are many passages of delicate and tender poetry scattered up and down the piece. Indeed, the whole is treated with an airy grace that has peculiar charm, while its abrupt contrasts and frequent changes must have made it a rare spectacle under the wise conduct of

"that admirable artist, Mr. Inigo Jones, master-surveyor of the king's work, &c., who to every act, nay, almost to every scene, by his excellent inventions gave such an extraordinary lustre—upon every occasion changing the stage, to the admiration of all the spectators—that, as I must ingenuously confess, it was above my apprehension to conceive."

Still, even in *Love's Mistress*, Heywood betrays the lack of the highest artistic instinct, which we discover in almost all his work. He cannot manage the Court pageant with that exquisite tact which distinguishes the *Endimion* and the *Sapho* of Lyly. The whole play has a running commentary of criticism and exposition, conveyed in a dialogue between Apuleius, the author of the legend, and Midas, who personates stupidity. Apuleius explains the allegory as the action proceeds; Midas remains to the end the dull unappreciative boor, who "stands for ignorance," and only cares for dancing clowns, or the coarse jests of buffoons. Apuleius is the type of the enthusiastic poet, whose wit is "aimed at inscrutable things beyond the moon." Midas is the gross conceited groundling, who, turning everything he touches to dross, prefers Pan's fool to Apollo's chorus, and drives the god of light indignantly away. Both of them wear asses' heads: Midas, because he grovels on the earth; Apuleius, because all human intellect proves foolish if it flies too far. There is much good-humoured irony in this putting of donkey's ears on the poet's head. This contrast between art and ignorance is paralleled by a series of subtle antitheses that pervade the play. Immortal Erôs finds a balance in the stupid clown, who boasts that Apollo has given him music, Cupid love, and Psyche beauty; but who remains untunable, unlovable, and hideous to the end. The juxtaposition of heaven and hell within our souls, the aspirations and the downfalls of our spirit, the nobility and the vileness of men around us, the perpetual

contradiction between the region toward which we soar in our best moments, and the dull ground over which we have to plod in daily life: such are the metaphysical conceptions which underlie the shifting scenes and many-twinkling action of the masque. It would be unfair to institute any comparison between *Love's Mistress* considered as a poem, and the delicate version of the legend in the *Earthly Paradise*. Yet there are touches of true poetry here and there throughout the play. The haunted house of Love which receives Psyche and where Echo and Zephyrus are her attendants, the visit of her three sisters, and the midnight awaking of wrathful Cupid, are all conceived with light and airy fancy. Cupid in his anger utters this curse on women:—

"You shall be still rebellious, like the sea,
And, like the winds, inconstant; things forbid
You most shall covet, loathe what you would like;
You shall be wise in wishes, but, enjoying,
Shall venture heaven's loss for a little toying."

When Psyche is about to journey down to Hades, she is warned:—

"When in Charon's barge
Thou art wafting o'er the dreadful waves of Styx,
An aged man, with a pale countenance—
His name's Oblivion—swimming in the flood,
Will heave his withered arms and cry: Help! Help!
Save me from drowning! Stretch not forth thy hand;
For, if thou dost, thou ne'er returnest to shore."

These two extracts sufficiently indicate the style of the more serious passages. There is another aspect under which *Love's Mistress* may be viewed—as a very early attempt at classical burlesque. Cupid, for example, is the naughty boy of Olympus. He describes Juno's anger against Gany-mede:—

"The boy by chance upon her fan had spilled
A cup of nectar: oh, how Juno swore!
I told my aunt I'd give her a new fan
To let Jove's page be Cupid's serving-man."

Vulcan appears at his forge with more orders than he knows how to deal with:—

"There's half a hundred thunder-bolts bespoke;
Neptune hath broke his mace; and Juno's coach
Must be new-mended, and the hindmost wheels
Must have two spokes set in."

He thinks of making Venus "turn she-smith," but

"She'd spend me more
In nectar and sweet balls to scour her cheeks,
Smudged and besmeared with coal-dust and with
smoke,
Than all her work would come to."

This is, of course, very simple fooling. Yet it contains the germ of those more thorough-going parodies in which the present day delights.

The play in which Heywood showed for once that he was not unable to produce a masterpiece is *A Woman Killed with Kindness*. All his powers of direct painting from the English life he knew so well, his faculty of subliming prose to poetry by the intensity of the emotion which he communicates, his simple art of laying bare the very nerves of passion, are here exhibited in perfection. This *bourgeois* tragedy touches one like truth. Its scenes are of everyday life. Common talk is used, and the pathos is homely; not like Webster's, brought from far. Tastes may differ as to the morality or the wholesomeness of the sentiment evolved in the last act. None, however, can resist its artless claim upon our sym-

pathies. The story may be briefly told. Mr. Frankford, a country gentleman of good fortune, marries the sister of Sir Francis Acton, and receives into his house an agreeable gentleman of broken means called Wendoll. They live together happily till Wendoll, trusted to the full by Frankford, takes advantage of his absence to seduce his wife. Nicholas, a servant, who, with the instinct of a faithful dog, has always suspected the stranger, discovers and informs Frankford of his dishonour. Frankford obtains ocular proof of his wife's guilt, and punishes her by sending her to live alone, but at ease, in a manor that belongs to him. There she pines away and dies at last, after a reconciliation with her injured husband. It will be seen at once that this drama belongs to the same class as *Arden of Feversham* and *The Yorkshire Tragedy*, though whether, like them, it was founded on some actual romance of private life, is more than doubtful. In the genre Heywood had predecessors, but none of his rivals surpassed him. The chief interest of the play centres in the pure, confiding, tender-hearted character of Frankford. His blithe contentment during the first months of marriage, and the generosity with which he opens his doors to Wendoll, form a touching prelude to the suspicions, indignantly repelled at first, which grow upon him after he has weighed the tale of his wife's infidelity related by Nicholas. He resolves to learn the truth, if possible, by actual experience. Here is interposed an admirable scene, in which Frankford and his wife, with Wendoll and another gentleman, play cards. The dialogue is a long *double entendre*, skilfully revealing the tortures of a jealous husband's mind and his suspicious misinterpretation of each casual word. When they rise from the card-table, Frankford instructs Nicholas to get him duplicate keys for all his rooms. Then he causes a message to be delivered to him on a dark and stormy evening, and sets off with his servant, intending to return at midnight unnoticed and unexpected. His hesitation on the threshold of his wife's chamber is one of the finest turning-points of the dramatic action. At last he summons courage to enter, but returns immediately:—

"Oh me unhappy! I have found them lying
Close in each other's arms and fast asleep.
But that I would not damn two precious souls,
Bought with my Saviour's blood, and send them,
laden
With all their scarlet sins upon their backs,
Unto a fearful judgment, their two lives
Had met upon my rapier."

Then, with a passionate stretching forth of his desire toward the impossible, which reveals the whole depth of his tenderness, he cries:—

"O God! O God! that it were possible
To undo things done; to call back yesterday!
That time could turn up his swift sandy glass,
To untell the days, and to redeem these hours!
Or that the sun
Could, rising from the west, draw his coach back-
ward;
Take from th' account of time so many minutes,
Till he had all these seasons called again,
Those minutes, and those actions done in them,
Even from her first offence; that I might take her
As spotless as an angel, in my arms!
Yet oh! I talk of things impossible,
And cast beyond the moon. God give me patience,
For I will in and wake them."

The following scene, in which Frankford pleads with his guilty and conscience-stricken wife, is full of pathos:—

Fr. "My God, with patience arm me! Rise, nay rise;
And I'll debate with thee. Was it for want
Thou playdst the strumpet? Wast thou
not supplied
With every pleasure, fashion, and new toy,
Nay, even beyond my calling?"

Mrs. Fr. I was.

Fr. Was it then disability in me?
Or in thine eye seemed he a proper man?

Mrs. Fr. O no.

Fr. Did not I lodge thee in my bosom?

Fr. Wear thee in my heart?

Mrs. Fr. You did.

Fr. I did, indeed, witness my tears I did.
Go, bring my infants hither. O Nan, O
Nan!

If neither fear of shame, regard of honour,
The blemish of my house, nor my dear love,
Could have withheld thee from so lewd a
fact,

Yet for these infants, these young harmless
souls,

On whose white brows thy shame is character-
tered,

And grows in greatness as they wax in
years—

Look but on them, and melt away in tears."

This scene exactly suits the genius of Heywood. Its passion is simple and home-felt. Each question asked by Frankford is such as a wronged husband has the right to ask. Each answer given by the wife is broken in mere monosyllables more eloquent than protestation. We feel the whole, because not a word is strained or far-fetched, because the tenderness of Frankford is not merely sentimental, because he does not rave or tear his passion to tatters; finally, because in the profundity of his grief he still can call his wife by her pet name.

One of the most delicate touches which bring out his character is conveyed in his desire to clear the house of everything that may remind him of his wife, when she is gone. He searches it—

"to see that nothing may be left
That ever was my wife's. I loved her dearly,
And when I do but think of her unkindness,
My thoughts are all in hell. To avoid which torment
I would not have a bolkin or a cuff,
A bracelet, necklace, or rebato wire,
Nor anything that ever was called hers,
Left me, by which I might remember her.

Her lute? O God, upon this instrument
Her fingers have ran quick division,
Sweeter than that which now divides our hearts.
These frets have made me pleasant, that have now
Frets of my heart-strings made. O Master Cranwell,
Oft hath she made this melancholy wood
(Now mute and dumb for her disastrous chance)
Speak sweetly many a note, sound many a strain
To her own ravishing voice; which being well strung,
What pleasant strange airs have they jointly rung!"

Even the conceits and play on words in this passage are not frigid; so natural and so intense is the emotion which pervades the whole.

Mrs. Frankford is no Guinevere, nor, again, like Alice in *Arden of Feversham*, is she steeled and blinded by an overwhelming passion. Heywood fails to realise her character completely, producing, as elsewhere in his portraits of women, a weak and vacillating picture. She changes quite suddenly from love for her newly-wedded lord to light longing for Wendoll, and then back again to the remorse which eats her life away. Wendoll is drawn more powerfully. We

see the combat in his soul between the sense of duty to his benefactor and the love which invades him like an ocean, drowning all the landmarks he had raised to warn him from the perilous ground. Adultery has been three times treated by Heywood. In *The English Traveller* Mrs. Wincott sins with the same limp and unexplained facility as Mrs. Frankford. In *Edward IV.* Jane Shore is meant to raise the same sentimental pity as Mrs. Frankford on her death-bed.

Thomas Heywood was a Lincolnshire man, presumably of good family, though I cannot find that the Visitations of that county record any pedigree of his name. No poet of his age showed a more intimate acquaintance with the habits of country gentlemen, and none was more imbued with the spirit of true gentleness. He was a Fellow of Peter House, Cambridge, where he probably acquired that learning which sat upon him so lightly. He began to write for the stage as early as 1596, and in 1598 we find him engaged as an actor and a sharer in Henslowe's company. Little else is known about his life, and, though it is certain that he lived to a ripe age, we are ignorant of the date of his death. Like many authors of his period, he adopted a motto for his works, to which he adhered, placing on his title-pages, *Aut prodesse solent aut delectare*. We may still say, with truth, that what he has written almost invariably succeeds in both these aims. His plays are defiled with very few coarse scenes, those to be found in *A Royal King and Loyal Subject* being an exception to prove the rule.

J. A. SYMONDS.

Northern California, Oregon, and the Sandwich Islands. By Charles Nordhoff.
(London: Sampson Low & Co., 1874.)

THE book before us is one of the simplest, and at the same time one of the pleasantest, narratives of travel we have met with for some time. The illustrations are numerous and excellent, and the descriptions so agreeably and unaffectedly given, that we can heartily recommend it to our readers. The first half of the book is devoted to the Sandwich Islands; and Mr. Nordhoff (in spite of his German name an American) with justifiable pride points to the happy social and intellectual state of the islanders as the fruits of good work done by American missionaries and American legislators. Forty years ago, when the band of missionaries, with Dr. Coan, Dr. Judd, and Mrs. Thurston amongst them, landed on these islands, they found the people in a savage state and given up to rapine and war. Now they are a Christianised, cultivated, and intelligent race, universally educated (for education is compulsory by law), very simple and Puritan in their habits, contented with the pleasant things they possess in their beautiful islands, without coveting greater riches. By the general purity of their lives they testify to the good and thorough work done by the determined band of New England men and women who settled amongst them not half a century ago. Annexation to the United States has often been proposed, but never carried out, for the soil of the islands is not sufficiently

rich to tempt the enterprise of American settlers, though it amply suffices for the wants of simple Hawaiians.

The islands are of volcanic origin, and possess many active volcanos. The most remarkable of these is Kilanea, in the island of Hilo. The description of its crater, with the two centres of burning seething lava, reads like a page from Dante's *Inferno*.

Mr. Nordhoff mentions a curious fact, that whereas seventy years ago horses were unknown in Hawaii, at the present day they have multiplied so enormously since their first introduction into the island, that they outnumber the inhabitants, and the government have laid a tax on them, impounding them in default of payment. A story was told of a planter who bought fifty horses out of the pound at twenty-five cents apiece, and then slaughtered them for his manure heap.

The Hawaiians, like the Red Indians of the North, have suffered much from their adoption of civilised habits, such as wearing clothes and dwelling in houses. They have so dwindled in numbers that it was necessary to obtain foreign labour, specially from China, for the cultivation of the land. Within forty years the natives have decreased sixty per cent. Since 1866 the islands have lost 6,062 natives, but within the last year or two the mortality has lessened, and the tide seems to have turned.

From Hawaii Mr. Nordhoff takes us to the Sacramento valley of California; but so much has already been written on the wonderful fertility of this favoured region, that we shall touch but lightly on the subject. The preparation, by drying, of the immense harvest of plums, cherries, peaches, nectarines, and apricots, grown in the valley, is rapidly developing into a most productive and prosperous trade. It also appears that it will better pay the vine-grower to use his grapes for raisins than for wine, for the raisins are equal to those of Malaga, fetch almost as high a price, and cost but little to prepare for the market. Progress in California marches on with such gigantic strides, that a stranger looks on breathless: ten years' work elsewhere is compressed into one here. There seems no limit to the development of the natural resources of this state. The climate is invigorating, there are no forests to be cleared, and the soil lies ready for the settler. Considering the immense returns already yielded to the superficial culture given, it would be difficult to exaggerate the boundless wealth that might be gathered in by systematic and patient cultivation. One of the most interesting and novel descriptions Mr. Nordhoff gives us is of his visit to the Farallon Islands, a group of six rocky islets, lying in the Pacific Ocean, about twenty-three miles from the Golden Gate of San Francisco. The Farallones, so-called from the Spanish for a small pointed islet, consist of a group of broken waterworn rocks, without sufficient soil to support more than a few scanty tufts of grass and weeds. On the chief island is a lighthouse with a very powerful lamp, and a huge fog whistle, blown by the rush of air from one of the caves that lead to the sea. No human being lives here, save the lighthouse keepers and

their families, but the island is tenanted by multitudes of rabbits, sea-lions and sea birds. The rabbits supply the San Francisco market. The sea lions are generally undisturbed, though occasionally one or two of them are shot by the egg gatherers to supply their lamps with oil. These animals, many of them as large as an ox, congregate by thousands on the cliffs, barking and shrieking through the caves, and plunging with boisterous noise into the waves beneath them. About the middle of May the "egggers" from the mainland come to collect the eggs of the countless sea birds for the San Francisco market, where they are eagerly bought by the bakers and restaurant keepers for use in cookery. The harvest was so lucrative that an egg war broke out between the rival harvesters, till the Government interfered and peace was enforced. The present company has bought the monopoly of the trade, and the harvest is gathered in peacefully enough, but not very pleasantly, as we should judge from the description given. From fifteen to twenty men are employed; the work is dangerous and difficult, the nests being in most inaccessible places; the birds, especially the gulls, defend their eggs fiercely when attacked, and when molested rise up with screams, which startle the whole rookery, who instantly whirl into the air, covering the egger with filth and guano. The birds are mostly gulls, murre, shags, and sea-parrots. The gulls are extremely fond of murre's eggs, and follow close on the egger, ready to snatch any eggs he may uncover. If successful, the gull flies off with the egg, tosses it into air, swallowing what he can catch, and lets the remainder fall on the egger below. When a colony of murre is disturbed by the egggers, the air above is literally alive with gulls, who flock to share the spoil, and flying off with all the eggs they can seize, literally drench the egggers with a shower of rejected shells and liquid.

During the season of 1872, 17,952 dozen eggs were sold in San Francisco. One season 30,000 dozen eggs were gathered and sold in the same market for about one dollar per twelve dozen.

On the largest islet, which measures less than one mile in diameter, it is computed that at least 100,000 gulls and murre build their nests, and this in spite of fog whistle, lighthouse, and thousands of sea-lions who share the island with them. Hitherto, these numbers have not perceptibly decreased, notwithstanding the immense harvest of eggs gathered from them year by year.

A. M. E. SMITH.

Registrum Abbatiae Johannis Whethamstede, Abbatii Monasterii Sancti Albani, iterum susceptae, &c. Edited by Henry Thomas Riley, M.A., under the direction of the Master of the Rolls. In Two Volumes, 8vo. (London: Longmans & Co.)

Few persons can fail to regard the long history of the monastery of St. Alban with peculiar interest. The recent attempt to restore its noble and sadly mutilated church to something like its former state touched a sympathising chord in the national mind.

People began to think of the protomartyr of Britain, and of the long succession of events and persons of note that have been connected with the religious house which bears his name. We are greatly indebted to the Master of the Rolls for having brought the history of this famous place so fully before us, and to Mr. Riley for the labour and enthusiasm which he has shown in carrying through the press the volumes which contain it.

The annals of St. Alban's date practically from A.D. 793, in which year Offa, king of Mercia, became the founder of the monastery. He chose an admirable site. Within an easy distance from London, it was connected with that city by the Roman Watling Street; and in the neighbouring town of Verulamium the early abbots had an inexhaustible quarry of wrought stone, which they liberally used. The benefactions to the abbey were on a large scale, and it soon assumed a very prominent position among the religious houses in the country.

St. Alban's was indebted to a great extent for this high place to the learning of some of its inmates. The Benedictine order was from its very infancy the nursery of scholars, and to their loyalty to their traditions we are indebted for no small proportion of the works at present extant, not only on local, but on general history as well. Both these classes are well represented in the series of Chronicles which Mr. Riley has edited. It already comprises eleven volumes. The first four record subjects of a general character, although they were composed in the *scriptorium* of St. Alban's. The rest treat of local and domestic occurrences, such as the lives of the abbots, and the history of the monastery and its estates during a long succession of years. There is no other religious house in England which can show a delineation of its career so exact and continuous.

In the two volumes which stand at the head of this notice, we have the history of the second abbacy of John Whethamstede, from 1452 to 1464. Appended to this are the Registers of his two immediate successors, with an Appendix, which contain documents of much less interest. With Whethamstede, courtier, scholar, and poet, as he thought himself to be, we may tarry with advantage for a while.

John Whethamstede derived his surname from a little village in Hertfordshire at which his father resided. His real name was Bostock, and he was a member of a Cheshire family of some repute, which until comparatively recent times retained its ancient estate and faith. In 1420 Whethamstede was elected Abbot of St. Alban's, having, for some time previous, been Prior of Gloucester College at Oxford, one of the places in that University to which the Benedictines, and specially they of St. Alban's, were wont to resort. The monks of Durham had a college of their own, now Trinity. Whethamstede presided over St. Alban's for twenty years, and then resigned his office, probably from political considerations. His acts and deeds during his first abbacy were duly chronicled by John of Amundesham. There was, however, but little of moment to record. The Abbot was

twice abroad at Councils, an honour for which he was indebted to his high rank in the Benedictine order. At home, his chief contention was with Bishop Alnwick on the question of jurisdiction, when that prelate wished to bring the Benedictine cells under his visitatorial power. The bishop touched the Abbot here on his tenderest point, and provoked an outburst of temper which was exceedingly unseemly. If the acts of the Chapter-General of the Black Monks in England were attainable, we should gain a clearer insight into this period of Whethamstede's life. There can be no doubt, however, that he plays a puerile and somewhat scurrilous part in his contest with Alnwick, who was infinitely his superior in conduct, intelligence and taste. Monastic bitterness is always the most bitter of all.

Whethamstede laid aside his mitre in 1440, and is one of the few persons in his position who in after years re-assumed the office which he had resigned. Of his second abbacy, which began in 1452, we have the history in the two volumes before us. The most interesting part of it is the account which we have of the two battles of St. Alban's, and of other public events of the time. Indeed, we have nowhere else so vivid a description of the politics and statesmen of this obscure and eventful period. In 1455 Whethamstede first beheld the horrors of war. A great battle took place in the town itself of St. Alban's, which the Northern soldiers subsequently plundered. Somerset, Clifford, the noble Percy, were found slain in the streets, and were interred within the abbey. Henry VI. was captured, and after being escorted by the Duke of York to St. Alban's shrine, somewhat in the character of an offering, was carried off to London. In this engagement the abbey escaped, but it was less fortunate in 1461. It suffered great loss at the hands of the Northern troops. The monks dispersed, and Whethamstede himself sought for refuge in his native village. When he emerged from his retirement, he overwhelmed the offenders with the direst maledictions, both in prose and verse. Contrasted with the Northern barbarians, as he calls them, the Harpies were more cleanly, and the plagues of Egypt more innocuous. Christian retribution was insufficient for such culprits. He consigns them unreservedly to the sterner justice of the bench in Hades. Even the means of torture at the disposal of the famous Three were out of all proportion to the crimes they were to correct. Four years after he wrote these invectives, the pen of the indignant abbot fell from his grasp. He died on the 20th of January, 1464-5, and was interred within the walls of his monastery.

In looking over the records of Whethamstede's abbacy, it is evident that he was a shrewd man of business, not over scrupulous at times, but doing his best for the interests of his house. He was a very strict disciplinarian, and was a schoolmaster to the end of his days. He was an inexorable foe to speculation, fond of litigation and power, very vain and restless. As a writer, his prose is remarkably turgid, and full of idle conceits and scholastic pedantry; his verse is simply contemptible. Whethamstede wrote, or rather

compiled, several works, of which one survives. This is the *Granarium*, or *Garner*, in which he has stored and arranged a number of extracts and notices of persons and things. It is, in fact, a specimen of a General Historical Dictionary, of which Jeremy Collier has given us, perhaps, the best example; and somewhat resembling a similar work compiled by Thomas Gascoigne, which is now in the library of Lincoln College, Oxford. Whethamstede's treatise manifests a good deal of reading. In his literary tastes he may be compared with his contemporary, John Wessington, Prior of Durham, with whom he would be intimately acquainted. Both of them were versifiers; both were compilers of historical commonplace books; both were proud of their monasteries, and took good care that their own official labours should be duly recorded. But Wessington had a simpler pen and a better regulated mind. I need scarcely add, that both were the heads of famous Benedictine houses.

Whethamstede has certainly earned a title to be regarded as a patron of letters. He built a library at Gloucester College, and did his best at all times to promote learning among the members of his order. Another library was founded at St. Alban's during his abbacy. He induced the poet Lydgate to versify the *Life of St. Alban*, and gave him 3*l.* 6*s.* 8*d.* as his reward. A list of twenty-five works is preserved, which Whethamstede ordered to be copied in the monastic *scriptorium*, in addition to the service books that were required in the church. No preceding abbot had kept the scribes of his house so constantly employed. And he had the heart to give away the books which he created. We find him giving a *Cato*, with a gloss, and two of his own works, to his unfortunate friend and fellow-student, Humphrey, Duke of Gloucester.

A long list of Whethamstede's additions to the various buildings of his house is duly set down in these volumes. He built two chapels within the church or its precincts, and greatly enriched the decoration of the various parts of the fabric. In glass, tiles, sculpture, painting, he left marks of his taste behind him. We have also a list of the lands that he acquired for his house, and of the sums which he expended on its estates. There is one notice which will interest Yorkshiremen. We are told that Whethamstede restored the chancel of the church of Appleton in Ryedale so stoutly that, if fire and water, or such like unexpected injuries, spared it, the fabric would last for a century without requiring alteration. A great part of this chancel, which had an apsidal termination, has now disappeared, probably through the subsidence of the bank on which it was placed. The village is generally called Appleton-le-Street, standing as it does on the great Roman road between Aldborough and Malton.

It is curious to trace through these *St. Alban's Chronicles* the history of their northern cell of Tynemouth, and the connexion of *St. Alban's* through it with the bishops of Durham. Tynemouth originally belonged to the priory of Durham, but it was taken away from that house by Robert

de Mowbray in the reign of William Rufus, and bestowed upon *St. Alban's*. Thereupon arose a controversy, which was terminated after some time by the cession on the part of *St. Alban's* of two churches in Northumberland to Durham. In 1104, Richard, Abbot of *St. Alban's*, was present at the translation of *St. Cuthbert's* body, and is said to have been the subject of a miraculous cure which the Durham hagiographer does not fail to record. Richard is said, on his return, to have set up an altar in honour of *St. Cuthbert*, but this seems to have been the work of a somewhat later period. In 1115 Bishop Ranulph Flambard was present at the dedication of the church of *St. Alban's*, and consecrated an altar to the honour of *St. Alexius* in a chapel which Abbot Richard built. It was Bishop Hugh de Puiset who dedicated at *St. Alban's* an altar to *St. Cuthbert*, *St. John the Evangelist*, and *St. Agnes*, towards the close of the same century. In the thirteenth century, Bishop Kirkham appropriated the church of Hartburn to *St. Alban's*, for the support of the hospitality of the monks. The munificent Bishop Hatfield, who was born in the neighbourhood, received his education at *St. Alban's*, and remembered it with kindness. We find Bishop Langley complaining that one of Prior Whethamstede's agents had enticed away a singing boy from the choir of his private chapel. With that noble gentleman, Bishop William Dudley, the monks of *St. Alban's* were on familiar terms. It was, no doubt, their connexion with Tynemouth which made the friendship of the bishops of Durham a matter of desire. There are some curious notices in these volumes of that great northern house, which is still so beautiful in its ruins that look down upon the Tyne and the sea. We are told about the election of the priors of the cell, and their merits and delinquencies. The Abbot of *St. Alban's* held visitations at Tynemouth, and when he rode northwards the palfrey on which he went was provided for him by this house. But the cost of the entertainment which he received had been duly moderated since the days of Abbot Simon, who had eaten the monks of Tynemouth out of house and home to such an extent, that at last they tearfully brought him the oxen of their plough, and told him that if he stayed longer he would have to consume these. The Abbot, who would as soon have eaten the plough, was soon back again among the more tender bees at *St. Alban's*. In 1426 the monks of Tynemouth were ordered to put an end to their unseemly festivities on the 4th of September, when they kept the feast day of the Deposition and Translation of *St. Cuthbert*. This was but a neighbourly compliment to their brethren on the banks of the Wear. Whethamstede's uncle and namesake was Prior of Tynemouth. Our Abbot composed his epitaph in leonine verses, which are excellent only for their demerit; and in 1458, when the Sub-prior of Tynemouth, John of Bamfrough, sent him a life of his uncle which he had drawn up, the Abbot thanked him in a long letter replete with classical allusions and ostentatious gratitude. It was, probably, for this reason that Whethamstede gave a silver-gilt cup (*not ten*) for use in the

Tynemouth buttery, and a silver-gilt chalice, with a cope of purple cloth of gold, to the church. We are told also a good deal about the delinquencies of Prior Nicholas Boston, who was a waste-goods as well as a truant. The manuscript from which the volumes before us are derived bears the name of Robert Blakeney, the last Prior of Tynemouth, who surrendered his house and retired with a comfortable pension of 80*l.* per annum. We wonder what Whethamstede would have said to Blakeney's immediate predecessor, Thomas Gardiner, who when Norroy King-at-Arms held the first heraldic visitation in the north in 1536, did not scruple to show by his pedigree that his mother was an illegitimate daughter of Jasper, Duke of Bedford; and, more than that, boldly impaled the arms of England with his own paternal coat, counting even the bar sinister an honour! What would Benedict have said to such a profaner of his rule?

The mention of Benedict reminds us of the many admirable illustrations of the history of his Order which these volumes contain. Mabillon would have heartily welcomed them. Let us, in conclusion, express a hope that we may soon have in print the Acts of the Chapter-General of the Black Monks in England, as far as they can be traced, together with a new edition of the Rule, with its Anglo-Saxon or English versions. We should be thankful also to see in print a series of Account Rolls, on a larger scale than those of the cells of Durham, to show the inner life and working of one of the great Benedictine houses. Durham is probably the only place at which such a series can be found. JAMES RAINE.

The Warriors at Helgeland. [Hærmændene på Helgeland. Skuespil i fire handlinger af Henrik Ibsen. Tredje Udgave.] (Copenhagen: Hægel, 1874.)

THERE is always a peculiar interest in returning to the early works of a distinguished artist, and in discovering there by what stages of development his genius proceeded in its onward course. Besides the merely critical curiosity of such a study, there is genuine pleasure to be found in noticing and valuing at their own rate the redundancies and florid affectations which have worn off in time, and which, having worn off, no longer distress, but amuse and please the reader, who has now no need to dread their increase in the future. A poet's wild oats have a charm of their own when once he has definitely settled down into a respectable householder of Parnassus, and the poems of a great writer's earliest manhood often possess a suggestiveness in the very violence of their incompleteness that we miss in later and more finished work. Before us lies a third edition of the first work by which Henrik Ibsen, the greatest living dramatist and lyricist of Scandinavia, stamped a sense of his individuality on the minds of his contemporaries, and we are glad to have the opportunity of examining what views of art and of human nature, what sense of harmony and action, Ibsen possessed while he was still a lad in the narrow circle of his native

country, and untaught by that larger experience of men and things that his long years of European exile have given him.

The *Warriors at Helgeland* was the diploma work by the production of which Ibsen signalised his entrance into public life at Christiania. From 1851 to 1857 he had fumed and fretted at Bergen, sick at heart of the narrow aims and interests to which he was doomed as director of the petty theatre there. Late in 1857 he gave up that unwelcome post to Bjørnsen, and posted up to the capital to be director of the National Theatre. Ibsen, who in nothing has been precocious, was peculiarly slow in the development of his poetic genius. Let no one try to read the pieces he produced at Bergen; they are without form, colour, or individuality, the best of all, *Fru Inger til Oesterrad*, being only a tame and second-rate drama of the school of Hertz and Hauch. He was nearly thirty years of age. Could any prospect be more discouraging? Here, said all the wiseacres, is plainly enough one instance more of that impotent lyricism that haunts some boys like a disease, and has no fruit in art. Suddenly, in 1858, appeared *The Warriors*, and the wiseacres said no more about the sterile flowers of youth. In some notable respects it was an innovation; it was a distinct return to the serious brevity and force of the antique saga-literature, and a revolt against the wordiness of Oehlenschlaeger, against which no Scandinavian writer had till then dared to appeal.

The plot of *Haermaendene* is in this wise: There were once two young warriors, Sigurd and Gunnar, who sailed from Norway to win goods and honour; they had sworn friendship to one another, and bravely held together. At last they came to Iceland; there dwelt an old lord who had come from Norway in King Harold's time. He had two fair women in his house, but one, his foster-daughter, Hjördis, was the nobler of these two, for she was strong in brain and soul, and the warriors spoke of her among themselves, for never had they seen so fair a woman. But Dagny, the old lord's daughter, was also very beautiful. And one night, when the men were drinking at the board, they spoke of these fair women in all men's hearing, as if they fain would have them to wife. But Hjördis swore in her pride that no man should have her hand unless first he did a mighty deed she named. Then Sigurd's heart rejoiced, for he felt himself strong to do the deed; but when they were alone, Gunnar so talked about his love for her, that Sigurd did the deed by night when no man saw his face, and let Gunnar wed Hjördis. But Sigurd, still loving Hjördis, married Dagny, and this was his bane, and many men died with him. For Hjördis had a cruel, passionate heart, and hated Sigurd for his renown and strength; but when she knew the truth, and what Sigurd had done for her, her love fell upon him, and she hated Gunnar. In the end Hjördis shoots Sigurd with a bow strung of her own hair, and when he falls slain at her feet, she rushes out and drowns herself. Hjördis is the most prominent character in the play: she is passionate, revengeful and implacable, and all the

wretchedness that comes about is the result of her violent temper. Dagny, meant to be a virtuous foil to her, is a very tame and unheroic person, chiefly brought in to be shocked at Hjördis's outbursts of passion. There were originally two drafts of the *Warriors at Helgeland*, one in verse and the other in prose; the version in verse was rejected in favour of the present form, where all the dialogue consists of terse, pointed sentences in prose. Here is an example. Hjördis is receiving her foster-sister and Sigurd into her house, and thus she assails poor Dagny:—

"Believe me, we have brave times here! Thou shalt see sights here such as thou didst never see in the King's house in England; we will be like sisters all the time thou art my guest; down to the sea will we go, when the stormy weather sets in again; thou shalt see the waves fly up the shore like wild and white-maned horses, and far out in the deep thou shalt see the great whales. They go against one another like warriors clad in mail. O! to sit like witch-women on the whale's back, to ride over the breakers, to wake the storm and allure men into the deep with our sweet love songs!"

There is a great deal of killing and cursing in the *Warriors*. To read it after such later books as *Brand* and *Peer Gynt*, is like returning to Marlowe after Shakspeare. Indeed, its very excellencies are of the Marlowe order; there is portraiture of all kinds of passion, stormy enough for the author of *Dr. Faustus*; there is plenty of rich description of a distempered and supernatural kind, but there is as yet no repose, no rounded beauty of finished form. Many of the strokes are aimed in the dark by a hand strong enough and ardent enough, but not yet fully trained in sword-play.

EDMUND W. GOSSE.

Recollections of a Tour made in Scotland, A.D. 1803. By Dorothy Wordsworth. Edited by J. C. Shairp, LL.D. (Edinburgh: Edmonston & Douglas, 1874.)

PASSAGES of this journal have already been published in the *Memoirs of Wordsworth* by his nephew, the Bishop of Lincoln, and sentences from it have long been familiar to the poet's readers as headings to some of the first *Memorials of a Tour in Scotland*. The relation in which the writer stood to her brother is also no secret; it was that of the ideal sister, a second self, without any of the personal needs or ambitions, which make the original, poetical self a burden almost as often as a glory or a joy; with a sympathetic intelligence strong enough to enter into the process of production, and able to stimulate the creative impulse by the cunning proffer of appropriate food, and yet with a taste and judgment so far independent in its origin as to run no risk of sinking into an imitative echo of the accomplished work. We know, for instance, that the Daffodils seen by brother and sister together, and the effect produced by their magic light and movement, were described first in Dorothy's prose, a prose that had so much in common with the poet's verse that, on another occasion, having read to him an account of her meeting with some beggars ("She had a tall man's height and more"), she adds, "and an unlucky thing it was, for

he could not escape from those very words." The interest which attaches to the present publication is accordingly not limited to itself; the journal has unmistakeable literary merits of its own, but it will be less read for these than because it is virtually a journal of Wordsworth's tour, a record of what he saw and felt, and how the moods produced themselves at leisure, which, then or later, found vocal expression in the well-known poems. From this point of view it is so suggestive that one is inclined to regret that the editor has not entered upon the larger undertaking, for which we imagine the materials exist, of giving the same kind of interpretation or commentary to other passages in the poet's tranquil life.

Coleridge, in his *Biographia Literaria*, has given the best name to a quality of some of Wordsworth's writing, which is felt as a defect by all but the most enthusiastic Wordsworthians, and by them is felt, not quite falsely, to be bound up inseparably with the peculiar merits of the work which they prefer as most characteristic. He objects to the *accidentality* of the details which Wordsworth sometimes gives, or seems to give, merely because they were real, when they have no natural propriety or artistic significance; and in meeting this or a similar charge, Wordsworth does not quite avoid the inconsistency of maintaining that the value of his details consists in their being typical (he is severe on a lady who speaks of his stanzas to a Daisy instead of to *The Daisy*), while at the same time he argues that his mission as a poet is not limited to the representation of permanent and universal affections, but that it is sufficient that an impression *may* be felt to justify him in reproducing it as felt. Walter Scott, who was naturally a degree further removed from complete sympathy with his theory and practice than Coleridge, felt still more strongly that the quality in question was a defect, and as such criticised it very adequately *à propos* of a story told by Wordsworth to prove that Crabbe had no imagination. They two and Sir George Beaumont were together when some one blew out a candle; Wordsworth and Sir George exchanged glances of silent pleasure as they watched the grey spirals of smoke vanishing into upward space, until Crabbe put an extinguisher on the taper and the aesthetic ecstasy—not without excuse, as Mrs. Scott opined, when it was ascertained that the taper was not wax. "In two other men I should have said, 'Why, it is affectations,' with Sir Hugh Evans," adds Scott, with the comment: "the error lies not in receiving deep impressions from slight hints, but in supposing that precisely the same sort of impression must arise necessarily even in the mind of men otherwise of kindred feeling." The question would probably reduce itself to one of fact. Are the seemingly trivial incidents with which Wordsworth associates sentiments or reflections of seemingly disproportionate weight, such as naturally and inevitably suggest strong feelings to a perfectly trained perception with a thoroughly responsive organisation? If so, the poet's triumph is complete, because he is able to compel every one who is capable of feeling at all to feel

exactly as he does on the particular occasion, which ceases to be a passing accident the moment it is permanently embodied in the literature of the imagination. If not, the poem will only please in virtue of the same kind of chance that made the incident it records please the poet. Wordsworth himself assumed uncritically that whatever might be felt about poetically was a fit theme for poetry, and the fact that he was generally able to communicate to others his own feeling under a real external suggestion, tended to discourage the further enquiry whether this result was due to the typical rectitude and acuteness of his emotions unconsciously selecting the choicest food, or to the equal natural aptitude of all food to nourish all possible emotions. When the poet avowedly looks within for the source of his inspiration, it is a matter of indifference how he names the objects of a predetermined independent feeling; and it is only because Wordsworth's theory makes the poet's attitude one of passive receptivity in the presence of nature, that he forfeits the right to make his own moods stand for objective realities. When the romantic school of art was fighting for dear life, its first care was naturally to meet the criticisms of its opponents, which were not, as a rule, either damaging or profound, and consequently some distinctions between aims allowable within the fold which we should have been glad to have drawn by Wordsworth himself, were left unnoticed. Thus, to take four of the finest and most thoroughly Wordsworthian of the poems, "The Idiot Boy," "The Waggoner," "Resolution and Independence," and "The Daffodils," we have two main and two secondary divisions of classification, according with the degree of objectivity given to the subject and its treatment. "The Idiot Boy" is perhaps Wordsworth's nearest approach to the dramatic; there is the most intense and vivid realisation of the scene in all its aspects, and these aspects are uncoloured by the poet's personality; he is lost sight of, or rather has become for the moment a flawless mirror to reflect the creature of his own imagination. In "The Waggoner" the realisation is equally perfect, the poetical originality of the conception is equally conspicuous, but the subject is taken from the real experience of the writer; the having and the losing of Waggoner and Wain were vital memories of Wordsworth's own; and that the simple objective treatment of such a subject should have furnished forth a poem of the first rank, is perhaps the most characteristic measure of his triumphant innovation. In the "Leech Gatherer" the point of view is shifted; the subject is not the relation between the narrator and the old man, but the subjective effect produced by the latter's appearance. The appearance is still realised with full imaginative truth, but it is subordinate to the accompanying mood, which the poet communicates as unfailingly as in the other case he imparts his vision. "The Daffodils"—which, strangely enough, Coleridge was inclined to abandon to criticism as trivial—differ, again, because they represent a mood produced by purely natural objects, which therefore had to be represented, not merely

with apparent truth, but with an appearance of efficiency, of active life, the existence of which the reader presumably had now for the first time revealed to him. It will probably be agreed, with all deference to Coleridge, that in these lines what Wordsworth saw is so completely and vividly expressed, that it can only be seen henceforward with his eyes and afterthought of feeling.

But, to return to Miss Wordsworth's journal: it is not always so clear that the poet has succeeded equally in all the parts of his undertaking, both to create anew the remembered scene, and to find or make a susceptibility equal to that which made it memorable to him. The stanzas called "Stepping Westward," charming as they are, seem not to have within themselves the same certainty of charm as the pieces above referred to; without something to prepare the mind for the appropriate mood, or to explain why the actual scene found it so prepared, the poem seems too fragmentary, too accidental for absolute perfection. The journal would be worth reading if it were only for the sake of finding these lines in their proper place. The travellers visited the Trosachs twice; on their way northwards Coleridge was still of the party, which, after a day's boating through rain and mist, was settled for the night in the ferryman's hut. The description is a fair sample of the writer's best style:—

"We caroused our cups of coffee, laughing like children at the strange atmosphere in which we were: the smoke came in gusts, and spread along the walls and above our heads in the chimney, where the hens were roosting like light clouds in the sky. We laughed and laughed again, in spite of the smarting of our eyes, yet had a quieter pleasure in observing the beauty of the beams and rafters gleaming between the clouds of smoke. They had been crusted over and varnished by many winters, till, when the firelight fell upon them, they were as glossy as black rocks on a sunny day cased in ice. When we had eaten our supper we sat about half an hour, and I think I never felt so deeply the blessing of a hospitable welcome and a warm fire. . . . The rooms were divided, not up to the rigging, but only to the beginning of the roof, so that there was a free passage for light and smoke from one end of the house to the other. I went to bed some time before the family. The door was shut between us, and they had a bright fire, which I could not see; but the light it sent up among the varnished rafters and beams, which crossed each other in almost as intricate and fantastic a manner as I have seen the under boughs of a large beech-tree withered by the depth of the shade above, produced the most beautiful effect that can be conceived. It was like what I should suppose an underground cave or temple to be, with a dripping or moist roof, and the moonlight entering in upon it by some means or other, and yet the colours were more like melted gems. I lay looking up till the light of the fire faded away, and the man and his wife and child had crept into their bed at the other end of the room. The unusualness of my situation prevented me from sleeping. I could hear the waves beat against the shore of the lake; a little 'syke' close to the door made a much louder noise, and when I sat up in my bed I could see the lake through an open window-place at the bed's head. Add to this, it rained all night. I was less occupied by remembrance of the Trosachs, beautiful as they were, than the vision of the Highland hut, which I could not get out of my head."

Perhaps some readers will be in the same predicament; the circumstantial touches

italicised are true Wordsworth. It is mentioned incidentally as a peculiarity of language that the peasants always refer to the points of the compass in giving directions, counting distances, &c. On the return journey the Wordsworths find it "a very pleasing thought that, few hours as they have been on the lake, there was a home for them in one of its quiet dwellings." But we must quote the whole description of the approach:—

"The path or road—for it was neither the one nor the other, but something between both—is the pleasantest I have ever travelled in my life for the same length of way—now with marks of sledges or wheels, or none at all, bare or green as it might happen; now a little descent; now a level; sometimes a shady lane, at others an open track through green pastures; then again it would lead us into thick coppice woods, which often entirely shut out the lake, and again admitted it by glimpses. We have never had a more delightful walk than this evening. Ben Lomond and the three pointed-topped mountains of Loch Lomond, which we had seen from the garrison, were very majestic under the clear sky, the lake perfectly calm, the air sweet and mild. . . . The sun had been set for some time, when, being within a quarter of a mile of the ferryman's hut, our path having led us close to the shore of the calm lake, we met two neatly-dressed women without hats, who had probably been taking their Sunday evening's walk. One of them said to us in a friendly soft tone of voice, 'What! you are stepping westward?' I cannot describe how affecting this simple expression was in that remote place, with the western sky in front yet glowing with the departed sun. William wrote the following poem long after, in remembrance of his feelings and mine:—

"What! you are stepping westward? Yea."

The stanzas are reprinted in the journal as well as the other poems memorial of the tour, which gain, though not all so much, by being read in connexion with the record of their first conception. We might quote many vignette-like sketches, which show how skilfully Miss Wordsworth had cultivated the art of seeing, of selecting and grouping the natural features of a landscape into an organic whole, with a sentiment or significance of its own. One constantly recurring complaint is of the bareness, to the imagination, of the long reaches of country without a sign of human habitation; and while eagerly chronicling the impressive effect which the figure of a solitary shepherd, or woman watching for they know not what, produces amongst otherwise unbroken stillness and repose, it is with still more unaffected satisfaction that she lights occasionally upon a nook of cultivated ground with habitable huts and friendly natives. While Wordsworth's tendency is to make the human figure a part of the landscape, to lend to it perhaps a larger share of the dignity of nature at the cost of some of its living reality, his sister seems rather to look upon the landscape as the background which owes its charm to the figures relieved against it. He speaks candidly of the men he loved,

"not verily
For their own sakes, but for the fields and hills
Where was their occupation and abode."

As Coleridge observes, his sympathy was contemplative rather than that of a fellow-sufferer or co-mate (*spectator, haud participes*), and the fact that this contrast continued to be visible in spite of the close and

constant intercourse and agreement of the two, must be held to confirm his account of the disposition from which he was recalled by his sister's influence, to waive the human element altogether, and subside into the poetry of imaginative sensationalism. He himself courted comparison with Crabbe, who was at the same time challenging attention by realistic tales of humble life and rustic passion; and though, of course, as poets, the two are not to be compared for a moment (which indeed was Wordsworth's opinion), as dramatic moral teachers the palm, it might be argued, should on Wordsworth's principle be assigned to Crabbe, who habitually represents the real feelings of a commonplace person, whereas Wordsworth does not always get beyond a representation of his feeling about them. The volume contains a few passages curious as illustrating the social condition of the Highlands seventy years ago, and parts of the itinerary might be made to serve in lieu of a guide-book; but, as has been said, its chief interest is of a durable, unexciting nature, as an addition to the rather scanty stock of current Wordsworth literature.

EDITH SIMCOX.

Historical Course for Schools. Edited by E. A. Freeman, D.C.L. 1. *General Sketch of European History.* By the Editor. 2. *History of England.* By Edith Thompson. 3. *History of Scotland.* By Margaret Macarthur. 4. *History of Italy.* By John Hunt. 5. *History of Germany.* By James Sime, M.A. (London: Macmillan, 1872-4.)

THE only question raised by Mr. Freeman's *General Sketch of European History* is whether it is not better suited for an appendix than for an introduction. Of the skill with which a narrative so extensive is compressed within such narrow limits, and of the firmness of hand with which threads so complicated are woven into a whole, there cannot be two opinions. But we suspect that few young people will be competent to understand the value of the work till they have mastered the whole of the course which is to follow. To those who know something of history, however, the book cannot fail to be of the highest value. To criticise it adequately would require the joint labour of many scholars, and we will therefore content ourselves with suggesting an amendment of the statement (p. 269) that "Richelieu, just like Francis the First, though he oppressed the Protestants in France, did not scruple to make a league" with Protestants abroad. Such a comparison is hard upon Richelieu, and we thought it was now pretty generally understood that though Richelieu made war upon the political independence of the French Protestants, he did not oppress them.

Evidently the success of this series depends mainly upon the success of the volume on English history; and though, after the extraordinary blunders committed in most school histories, a critic will be inclined to be lenient towards anyone who even tries to do better, it is not long before even the sternest critic will discover that Miss Thompson has no reason to ask for leniency.

It is doubtful whether history can ever

be satisfactorily taught in so compressed a form. But, if that question be settled in the affirmative, Miss Thompson need fear no rivals. The way in which she tells a story correctly without introducing more hard names or more particular facts than are absolutely necessary, is worthy of the highest praise. Anyone having a thorough acquaintance with any period of history will probably appreciate her skill in this particular more than those for whose use the book is primarily intended. And we get rid once for all of those abominable lists: "During this reign London Bridge was finished; letters of credit were first used in England," &c. Instead of this mere burthen upon a child's memory, Miss Thompson pauses from time to time to give a survey of the course of literature or art, or to bring together in an interesting form some other group of subjects. Thus the whole history of the translations of the Bible is given upon the occasion of King James's translation, whilst the following description of Gothic architecture will serve as a specimen of the way in which such subjects are treated. That architecture, she says (p. 66)—

"Is also called *pointed*, because its leading feature is the pointed arch. Salisbury Cathedral is a good specimen of early Gothic; and the Eleanor crosses, and the nave of York Minster, of that which prevailed under the first three Edwards. The naves of Winchester and Canterbury Cathedrals represent the form intermediate between York nave and the latest Gothic, of which the chapels of St. George at Windsor and of Henry VII. at Westminster are examples."

The intelligence of the child is thus awakened to the fact that there is a difference between one Gothic building and another, whilst he is spared the unnecessary task of mastering the hard words Decorated, Perpendicular, and so on.

The weakest part of the book is to be found in those pages in which knowledge of the general movements of society is required. Not that such matters would be proper subjects, as a rule, for a book for children, but the writer ought to be more thoroughly acquainted with them than Miss Thompson appears to be. Thus we miss the capital story of Edward I. ordering that priests who refused to pay taxes should be excluded from protection in his courts, which would certainly have been seized upon by anyone in whose eye the conflict between the royal and the sacerdotal power had anything of the importance which it deserves. The real place of the Wars of the Roses in history, too, is very inadequately conceived; and when the only cause for them alleged is the struggle amongst the nobles, no longer enriched by the plunder of France, we can only beg Miss Thompson before her second edition is issued—and we hope she may live to see a hundred—to study Mr. Gairdner's excellent preface to the first volume of the *Paston Letters*. She will then see that the desire for a strong government to prevent juries being bribed or bullied, and to put a stop to the scenes of violence which were only too frequent, had a great deal to do with the matter. And this failure to grasp the character of these wars leads to a failure in appreciating the reign of Henry VII. Miss Thompson's readers

learn nothing of the Star Chamber till they come to the reign of Charles I., when the judicial element in its composition is entirely ignored. But, after all, the sooner all persons entrusted with the education of young people buy the book, the better for their pupils and themselves. For elder children who require fulness of detail, the book is clearly not intended; but even they will do themselves no harm by reading over the story of their country's progress in its compressed form.

Miss Macarthur's *History of Scotland* is written with much the same care as Miss Thompson's book. There is something unexpected in finding the chapter containing the history from 1097 to 1286 headed "The English Period;" but it serves well to bring out the character of the reigns of the kings who ruled in it. Miss Macarthur has taken special pains to relate such burning questions as those relating to the struggle against Edward I., and the dethronement of Mary, with due impartiality. But it may be doubted whether she always hits upon decisive argument in the right place. Thus she tells us (p. 38) of the difference between Edward's view that Scotland was a fief and the old view of commendation, and infers that both parties were partly wrong. Surely the question of fiefs and commendation reaches only to the outside of the quarrel, even if we are prepared to accept the view which some English writers have taken on the subject. The real fact of importance is that a Scottish nation arose out of it all, which burst asunder the old forms of feudal and earlier arrangements as if they had never been. Evidently Miss Macarthur feels this. She speaks of Wallace's revolt as the result of "a spirit of defiance and opposition where resistance was least to be looked for, among the Lowlanders."

"Bannockburn," again she says, "is noteworthy among battles, as being one of the first to prove the value of Wallace's great discovery that footmen, when rightly understood and skilfully handled, were, after all, better than the mounted men-at-arms, hitherto deemed invincible. Like Morgarten and Courtray, the fields on which the Flemings and the Swiss about the same time overthrew their oppressors, this victory of the Scots stands forth as a bright example, showing how, even in that age of feudal tyranny, a few men of set purpose, fighting for their common liberty, could withstand a great mass of feudal retainers fighting simply at the bidding of their lords."

The thought is in the words marked in italics. But it would have borne being dwelt upon at least at the length at which the difference of fiefs and commendations has been dwelt upon.

Of the remainder of her task Miss Macarthur has probably acquitted herself as well as was possible. Scottish history is so full of unsolved problems, and has been so much the prey to party hatreds, that the work of writing it, especially for children, is one of extreme difficulty. The way in which she has accomplished it shows that she has fully understood the difficulty, and has done her best to overcome it.

It is not surprising that Mr. Hunt's *History of Italy* is the least satisfactory of the series. That this is the fault of the subject rather than the author Mr. Hunt

shows by the way in which the last chapter is written, which tells of the recovery of Italian unity and independence. Probably a good history of Italy suitable for children cannot be written by anyone. A history of Venice or Florence might be so handled as to instruct and interest the young. But the history of a country without unity, and no tendency to become united, can only be treated satisfactorily in the sort of way in which it is treated by Quinet in his *Révolutions d'Italie*, in which the common life of the Peninsula, underlying the diversity of States and Governments, is touched with a light hand. Such a book, however, would be useless for the young, who have not sufficient knowledge to comprehend it. Mr. Hunt, too, hardly makes the most of the days of Papal greatness, in which the old Roman spirit of rule was reproduced; and when he speaks of the marriage of the clergy as preventing them "from giving all their strength to the struggle for power, and as lessening the veneration of the lay folk by bringing the priests down to the level of other mortals," he forgets that whether the enforced celibacy of the clergy were good or bad in itself, it at least had the support of all the highest minds of the age, which would hardly have been the case if it had not rested on some better ground than this.

Mr. Sime is more fortunate than Mr. Hunt. Except in the brief intervals of the interregnum of the thirteenth century, and of the domination of the first Napoleon in the nineteenth, Germany, from the days of Charlemagne, has always had some centre of unity round which to gather, however feebly the pulse of nationality might beat. Mr. Sime is therefore able to group his facts round the fortunes of the Empire, and to give to them a unity of treatment which is only possible when they are viewed from some central point. The volume, we are told, "has been carefully revised by Mr. A. W. Ward, than whom England can supply no one better fitted to deal with matters of German History of all dates." But *aliquando bonus dormitat Homerus*. In his wakeful moments Mr. Ward of course knows that it was Christian of Halberstadt, not Christian of Anhalt (p. 153), who opposed Tilly in 1622, and that Mansfeld was defeated at the Bridge of Dessau, and Christian of Denmark at Lutter in 1626, not in 1627 (p. 154). But these are mere slips of the pen. The great question with this as with the other volumes of the series is whether it is possible to interest children in so brief a narrative. In the hands of an experienced teacher the value of these books would be very great, as supplying accurate knowledge on subjects on which accurate knowledge is much wanted. But teachers capable of clothing the bare bones with flesh are not always to be had, and young people will probably regard as just a trifle dry a book which tells the whole story of the Reformation struggle in Germany in seventeen short pages, and dismisses the period which extends from the Peace of Augsburg to the end of the Thirty Years' War in fourteen and a half.

SAMUEL R. GARDINER.

CURRENT THEOLOGY.

Theologia Germanica. By S. Winkworth. (London: Macmillan & Co.)—The preface and introduction might almost as well have been omitted from this very pretty reprint, for they are addressed to the public of twenty years ago. The book itself has more of the advantage of *à propos* now than when it was first translated, for the course of theological discussion has brought us back to the rudiments of the religio life, and to works which, like the *De Imitatione* and the *Theologia Germanica*, give the last word of bygone schools of piety. It is curious that the *De Imitatione* should have been so much the more popular of the two, for it represents the mysticism of the mediaeval cloister reduced to its last and most faultless expression, while the *Theologia Germanica* represents the mysticism of groups of pietists who for the most part lived in the world. Both—though the *Theologia Germanica* insists parenthetically on bare passive good will—are really open to a charge brought too indiscriminately against all mystics: they make the love of God too much an *égoïsme à deux*; but, taking the books as a whole, the *De Imitatione* is clear and rational, while the *Theologia Germanica* is confused and arbitrary. One reason of this is that the *De Imitatione* is founded on the ecclesiastical tradition of a time when the Church included the whole of culture, while the *Theologia Germanica* is founded on the fragmentary traditions of uneducated coteries, who accepted ecclesiastical observances without understanding them, only because they had sense to perceive that upon the whole this disturbed their inward peace less than resisting them. The superior good sense of the *De Imitatione* comes out very clearly in the treatment of the ups and downs of spiritual life: the German author talks of passing many times in a month from the mystical Heaven to the mystical Hell and back again, while the Latin recommends such things to be left to themselves, and not allowed to draw off the attention from patient continuance in well-doing. In fact, the *Theologia Germanica* altogether ignores the worth of common virtue and the simple fulfilment of everyday duty, which gives implicitly and unconsciously the temper which the author inculcates as something to be reached consciously by the most heartrending struggles. The whole book is pervaded by a contradiction; it preaches self-renunciation in a way that can only be understood by the most exaggerated self-consciousness. And as the subjective worth of the outer life is missed, the writer is tempted by extravagant theories of its objective value, as if the life of the world and humanity were in some way necessary to the complete self-realisation of God. If so, God apart from and above the creature could not be the supreme all-sufficient only Good which the author always says He is. Neither, leaving this out of the question, does it appear why the false light and the false freedom of Antinomian quietism, which the writer has always to combat, is to be condemned if it satisfies "nature;" for the only criticism which can condemn an individual "nature" is the external historical order, which the author only appeals to in a capricious way when he wants a precedent—too isolated to be convincing, because the facts of sacred history only have a meaning for him as repeated in the individual consciousness. The writer indeed has another and a valid criterion in the experience of the truly spiritual. But this criterion is incommunicable; and for this reason a popular and durable religion is hardly likely to be built upon the facts of individual consciousness. The attempt which is being renewed in our own day is apt to throw doubt upon the reality of the facts (admirably described in the *Theologia Germanica*), for the following reason. There are people born without an eye for colours; there are people born without an ear for music; there are people born with little heart for religion: it is only the last who are reproached for their defect; it is only they who treat the pleasures and the

experience of more receptive natures as chimerical; hence it may come to be commoner for the naturally unmusical to learn to sing in tune, than for the naturally irreligious to learn to pray.

The Third Book of St. Irenaeus, Bishop of Lyons, against Heresies. Edited, according to the Benedictine Text, &c., by H. Deane, B.D. Oxford, Clarendon Press. (Macmillan & Co.) Mr. Deane's Preface tells us that "the work has been undertaken for the convenience of students for the Theological School, and does not pretend to any originality." The reader is disposed to regret this modesty of aim, for what is done is done well enough to indicate that we might have had a good deal more.

This book is little more than a handy reprint, while Mr. Deane could have given us a real edition; the glossary appended is good, and the marginal notes are good enough, but there ought to be half as much again of the first, and three times as much of the second. The principle of recent changes in the Oxford Schools seems to be to introduce the study of books important for this matter, but lying beyond the classical period of their languages; but it is to be hoped that in extending the range of a student's ordinary reading the requirement for scholarly accuracy will not be forgotten. Because Cicero is a classic and Irenaeus is not, it does not follow that the one can be learnt from a slight if not careless treatment, such as everyone would see to be inadequate for the other.

The Epistle of the Apostle Paul to the Romans. A New Translation, with Notes. By John H. Godwin, Hon. Prof. New Coll. Lond. (Hodder & Stoughton.) Exegesis is doubtless a different thing from the History of Dogma, but it is neither essential nor desirable, as a qualification for treating the former subject without prejudice, to ignore or refuse whatever light can be thrown upon it from the latter: to do which seems to be a fundamental canon with Professor Godwin. The consequence is that, though sometimes ingenious and oftener suggestive, his notes are rarely conclusive, and his translation never satisfactory. If we make abstraction of any supernatural influences on the belief, such as are supposed to have been common to St. Paul and to later Christians, then no doubt it will be right, in attempting to discover his real meaning, to set aside the meanings that have been imputed to him by Catholics and Lutherans, Calvinists and Arminians; but, whether St. Paul's doctrine of grace coincided with that of any of these schools, or was something different from all, the history of language has determined that "grace" is the English word for *whatever* he meant by χάρις. This being so, nothing whatever is gained by translating it "favour;" it might have been worth while to remind us that it was not as a technical term of theology that he took up the word, but from the use he made of it it was both inevitable and legitimate that it should become one. On the other hand, "lower nature" is often a correct gloss upon the Pauline σάρξ, but is in no sense a translation of it; but where the literal translation is familiar, Mr. Godwin prefers the paraphrase, just as he reverted to the primary meaning where it sounded strange. The analysis of the Epistle is well conceived, but not lucidly arranged; and there seems a little uncertainty whether the passages from speeches in the Gospels, prefixed to each section, are meant to serve for edification or for illustration. The whole book reads too much like a reproduction of lectures on successive portions of the text. Now, the information which a professor is forced to distribute according to the artificial divisions of his time, an author ought to collect in a comprehensive view, and arrange in a rational digest, adapted to the intellect of a competent reader, instead of the exigencies of a class.

The Wise Men: who they were; and how they came to Jerusalem. By Francis W. Upham, LL.D. (Hodder & Stoughton.) Dr. Upham maintains, to the comfort and edification of

several devout Americans, that St. Matthew's "wise men" were not vulgar enchanters, but members of a regular national hierarchy—the Persian, he thinks, rather than the Chaldean. This is surely in its negative part little more than "Glimpses of the Obvious," and in the affirmative we find assertion disproportioned to the proof; but the author writes in good taste and with a scholarly tone, and has some knowledge of the contents of the Zendavesta, apparently at first hand.

Essay on Germs of Scepticism. By Mrs. Louis Le Bailly. (Town and Country Publishing Co., Limited.) Mrs. Le Bailly writes with a fervour that sometimes suggests matter for thought, but fails to make up for her total ignorance of even her own side of a controversy.

The Bible Educator (edited by the Rev. E. H. Plumptre, M.A., and published by Messrs. Cassell, Petter & Galpin) has its educational value—whatever that might otherwise be—greatly diminished by the unfortunate circumstance that it came out in numbers. In consequence, whatever might have been valuable as a treatise had to be transformed into a series of articles: and the change might be effected in two ways, either by the mechanical division of section from section, which is unjust to the author and wearisome to his readers, or by the author condescending to the conditions of magazine-writing, which does still more harm to both. There are papers here—those on natural history, and most of those on "Books of the Old Testament"—that will repay picking out their *disjecta membra* and reading them continuously; there are others not free from flimsiness and incoherence that can only be excused by the conditions that produced them; and others (some by men of reputation within their own sphere) whose inclusion can only be justified if rhetorical commonplace be as instructive as special knowledge.

More instructive than such a collection of miscellaneous essays or lectures would be a series of good school editions of separate books of the Bible; and Mr. Bowker's little book (*St. Mark's Gospel*, with explanatory Notes, by George Bowker) is a good example of the size and appearance such editions should have; while St. Mark's Gospel would admit, more easily than most books, of adequate treatment without entering on disputable questions. But it is not adequately treated here: there is in fact little beyond what any decent schoolmaster would know, or what any thoughtful schoolboy with a reference Bible could discover. What little there is consists mostly of information on points of Jewish antiquities—not derived in general from very good authorities, nor always repeated very accurately from those employed. Messrs. Sampson Low are the publishers.

Hartham Conferences, by the Rev. F. W. Kingsford (H. S. King & Co.), are as one-sided in argument as most tracts; but, if dialogues on religious subjects do not rise above the tract level, we need only condemn their author if he meant them to rank as literature.

Sermons for the Times. Preached in St. Paul's Cathedral and elsewhere. By Thomas Griffith, A.M. (Longmans.) If all conscientious preachers were thoughtful and well educated, we should have many more sermons like Mr. Griffith's than we have now; and this would no doubt bring or imply great benefit to the average clerical mind. It is more doubtful whether it would tend to benefit the Church generally: if it is a misfortune that the clergy now often stand outside the general tendency of thought, it does not follow that, if they understood it, they would be able or competent to guide it rightly. An educated congregation is now often liable to be wearied by a good man who is unconscious that logic is applicable to religious matters: but they are commonly content to learn from his religious earnestness, without applying to his mind the test of logic. It will be other-

wise if he learns to provoke them by a parade of logic, which the position of a speaker will force him to supplement by rhetoric. A man of God exerts a practical attraction towards godliness; but the disputant who tells us, when we have no chance to answer him, that "there are yet words for God," arouses the reflection that there are yet words for atheism, or at least for the atheists whom he affects to understand and does not. Men who are not convinced by Pascal will not be by a contemporary who rediscovers Pascal's position.

Mr. Brown's sermons (*"Until the Day Dawn:"* Four Advent Lectures. By the Rev. Marmaduke E. Brown. Henry S. King & Co.) keep well on the level of good and thoughtful preaching of the common, non-logical type: in spite of a little affectation and false symmetry, the first rises above it. He has not, or at least does not show, a tithe of Mr. Griffith's ability; yet his sermons must have been better worth hearing—perhaps they were even better worth publishing.

Voices of Comfort (edited by Thomas Vincent Fosbery, M.A., and published by Messrs. Rivington) reminds one in its plan of Dr. Vaughan's *Rays of Sunlight for Dark Days*; it is, like it, a canto of devotional passages in prose and verse of a consolatory tone, but is less derived from the classics of the language, and more from contemporaries, more also from sermonists or professed devotional writers: a good deal being contributed by the editor himself, and two or three personal friends. A work of this kind is not to be judged by a literary standard—to tell the truth, some of the extracts would not bear such a judgment very well; but it is praise enough to say that the volume as a whole has a harmonious tone, and leaves an impression on the mind just such as Mr. Fosbery desired to produce.

Life of S. Vincent de Paul. Edited by the Rev. R. F. Wilson. (Rivingtons.) This book is readable, but it is no use to read it. The writer has made a compilation from the standard French lives without taking the least pains to realise the individuality of the saint or his place in Church history. The editor seems to think English readers will have a special admiration for Saint Vincent, and find him an useful model. The present time is not likely to foster simplicity, which was one great element of his power: his almost obtrusive humility would now generally be regarded as importunate; in our present state of ecclesiastical anarchy his confidence in routine would only lead to disappointment. The most noticeable anecdote is of a monk who applied to the Saint when he was on the board of ecclesiastical patronage to get him made a bishop, that he might have a dispensation from austerities and husband his strength for preaching: the Saint advised him to take a rest from preaching and persevere in his austerities. There is also a noteworthy letter to a bishop, whose diocese was attacked by the plague, advising him to visit the infected places, but avoid infection, while encouraging the clergy to brave it.

Annus Domini. By C. G. Rossetti. (Parker.) Miss Rossetti has issued, with the imprimatur of the Rev. H. W. Burrows, a text and a prayer for every day of the year, with a hymn at the beginning, the only part of the book which belongs to literature.

Le Baptême. Par R. Bezoles, avec une préface par Emile Burnouf. Directeur de l'Ecole française d'Athènes. (Paris: Maisonneuve et Cie.) M. R. Bezoles, lost to science last year by an early death, had prepared a comparative study of baptism in the Greek and Latin churches, and this work has recently been published at Paris, with an introduction by M. E. Burnouf. We can but pay our tribute to the spirit of minute and attentive research which M. Bezoles carried into the smallest details of his subject, and from its abundance in technical information his essay may be consulted with profit by all those who like this often instructive class of liturgical enquiries. It is only to be regretted that the author should

have undertaken this comparison with a very defective knowledge of the history of the Church and of dogma in the first ages, as this circumstance takes away almost all weight from his conclusions. For instance, when we see Dionysius the Areopagite seriously quoted as first Bishop of Athens, and the date of his death given as 95, we are more edified than we could wish as to the critical value of such a work. It is no less astonishing that M. E. Burnouf does not even appear to suspect all the defects of this nature in M. Bezoles' studies. This is perhaps due to the strange point of view which he seems to have adopted in his appreciation of religions in general. Thus we read at p. 3 of his preface that "religions only live by their mythology." It is obvious that those who believe that it is precisely that whereby they perish, are unable to start on a critical appreciation of them from principles like those enunciated by the Director of the French School at Athens.

Dictionary of Sects, Heresies, Ecclesiastical Parties, and Schools of Religious Thought. Edited by the Rev. John Henry Blunt, M.A., F.S.A. (Rivingtons.) Comparing the *Dictionary of Sects, Heresies, &c.*, with the same editor's *Dictionary of Doctrinal and Historical Theology*, the later work appears more valuable and complete in execution than the earlier, in nearly the same proportion as the scheme and subject is less extensive. In the one most of the articles were too short to give the writers room for more than the enunciation of their own views, which were mostly commonplace, even if held intelligently; some were mere bits of antiquarianism, of the sort least akin to fruitful or instructive history; while the best were essays on speculative subjects, selected almost at random, and each too vast for satisfactory treatment in less than a volume. In this, the subject gives less scope for the airing of individual or partisan opinions and sympathies, and more for research; now, without saying that the research of Mr. Blunt and his coadjutors has been very profound, we must admit that they have collected a great mass of information, which it would be very hard to get at elsewhere, and of which a good deal is both useful and interesting.

One might have expected, from the traditions of high orthodox Anglicanism, that the best part of the book would be the account of heresies in the primitive Church; on the contrary, there is here little embodied of the results of the best and latest historical criticism, and, though putting the outlines of the subject in a convenient form, the book will do little to raise the standard of accuracy of knowledge upon it. But the mediaeval sects are, in general, fairly, intelligently, and pretty clearly described; the history of religious movements and parties in Germany is more than respectable; and that of the various sects developed since the Reformation in England, Scotland, and the United States seems to be as well done as is allowed by the complexity of the subject, the scantiness of its intellectual interest, and the consequent scantiness of literary material for its treatment. In the articles on "Schools of Thought" a certain narrowness may be observed, but scarcely blamed; the work is not a dictionary of philosophy, and it is, therefore, no fault in it that thinkers and systems are treated only upon the one side where they come into contact with Christianity.

The history of theology will not and should not be written by men without theological opinions; and it is no blame to English High Churchmen that they let theirs be seen even when treating a subject historically. Of unfairness in telling a story there are very few instances, though matters of still living controversy are a severe temptation; the article "Broad Churchmen" is in this respect the worst in the book, while it savours of petty spite to treat "Roman Catholics" as the name of an English sect organised by the Jesuits in or about 1570. The article, however, under this title on the Roman

community in England has the characteristic merits of those dealing with the same period; and the history both of the Reformation and of the rise of Puritanism is, on the whole, intelligently conceived and impartially told. But it is a pity that the editor has not yet learned from Mr. Freeman that the British Church before St. Augustine, whether better or worse than the English Church founded by him, is at any rate not to be called English.

EDITOR.

NOTES AND NEWS.

It is a sign of the wakening intellectual activity of Italy, that translations of two English books scientifically treating of economy and politics respectively—Mrs. Fawcett's *Elementary Lessons in Political Economy*, and Mr. Freeman's *English Constitution*, will be shortly issued from the Italian press.

MR. HUBERT SMITH, the author of *Tent Life with Gipsies in Norway*, has built himself a house near Laurvig, in that country, where, on July 9, he was married to a gipsy of the name of Esmeralda, who is said to possess extraordinary musical talent.

WE have received from the publishers, Messrs. Sampson Low and Co., a translation of Victor Hugo's *Quatre-Vingt Treize*. It is in three volumes, and is the result of the labours of Mr. Hain Friswell and Mr. Frank Lee Benedict. It is not expressly stated how their labour was distributed: whether one translated and the other revised, or whether both worked together at the translation. But however the result has been attained, it is not a very satisfactory one. It would be hard to make a dull story out of *Ninety Three*, even by the worst translation conceivable; and we may say that after having passed through the hands of Messrs. Benedict and Friswell, *Ninety Three* still remains a tolerably readable book. It is by no means a perfect translation. But much in Victor Hugo defies perfect translation. Unfortunately the version before us fails in that which it is quite easy to render. There is much awkwardness of idiom. For example: "He is about to risk, he also, serious danger." And there are expressions which are not part of our native tongue: "Boisberthelot grumbled, in a half-voice, in the ear of La Vieuville." And the Revolution is spoken of as "she," instead of "it." Why is a Revolution "she"? We do not know; but it is plain that the translation is rather a crude piece of work.

AMONG Messrs. Trübner's announcements for October next is an English translation, under the author's revision, of Carl F. Neumann's *Iloei Schein*, or the discovery of America by Buddhist monks in the fifth century.

MESSRS. CASSELL, PETER and GALPIN intend to issue shortly a work dealing comprehensively with the History of the Reformed Churches. The work will be entitled *The History of Protestantism*.

AN excellent article from the pen of the Comte de Jarnac on Sir Robert Peel appears in the last number of the *Revue des Deux Mondes*. Such a subject would generally trench too much upon the domain of modern politics to form suitable matter of comment from us; but the chief value of this essay is derived from the interesting personal and social reminiscences which it contains. Comte de Jarnac, then Comte de Rohan-Chabot, first visited London at the end of the year 1838 as second secretary of the French Embassy, and was in almost continual residence here till the fall of Louis Philippe. Intimately associated as he was with our leading statesmen, and a constant attendant at our parliamentary debates during a period which included the stormy days of O'Connell, and the not less exciting movement for the repeal of the corn laws, these graphic sketches of men and measures from a foreigner's point of view should attract considerable attention. Perhaps we may without offence give one extract, which follows upon the description by the Comte

de Jarnac of his first interview with Sir Robert Peel:—

"Quelques jours après, il m'engagea à dîner; les invités étaient peu nombreux: le marquis de Chandos, depuis son collègue au ministère sous le titre de duc de Buckingham, un membre du parlement orangiste, le colonel Verner, et M. Disraeli, quant alors affectueusement dévoué à son chef. Toujours brillant et disert, M. Disraeli tint sans relâche le dé de la conversation, où sir Robert Peel ne manquait pourtant point de placer quelques observations frappantes, quelques saillies enjonnées. Que de fois j'ai dû penser depuis à ce dîner, à la douce cordialité qui régnait entre les deux principaux convives, quand j'ai assisté aux terribles luttes qui suivirent la rupture, et vu le grand homme d'état succombant sous les coups d'un rival dont il n'avait point suffisamment pressenti la puissance et les hautes destinées!"

On two points, however, the writer seems to labour under a misapprehension. He mentions the late Lord Derby as the "Hotspur of debate," and seems to detect in the tone of that orator's speeches an echo of the "cri de guerre du chevaleresque Percy: 'Encore une fois sur la brèche, chers amis, encore une fois.'" For this latter illustration he will scarcely find authority in Shakespeare, though we will readily allow that the poet puts similar words into the mouth of Henry V.

THOSE who have read the account of the festivities at Avignon will turn with pleasure to an article by M. Henri Blaze de Bury in the same number, entitled "Laure de Noves." The author gives an eloquent and trustworthy summary of the lives and relations of Petrarch and Laura, with spirited sketches of Papal Avignon and Vaucluse, and of the very complex society of the fourteenth century, so familiar to Englishmen from the pages of Chaucer. M. de Bury's article is not the least graceful offering that has been made to the poet's memory on the five-hundredth anniversary of his death.

APROPPOS of the fête, M. W. C. Bonaparte-Wyse, the author of *Li Parpaillon Bleu*, has published a translation of Théophile Gautier's exquisite poem *Le Triomphe de Pétrarque* in English and Provençal, with the original text printed in gold letters.

THE *Nation* announces that Mr. J. W. Bouton will shortly begin issuing, in ten parts, at 2 dols. 50 c. each, Mr. G. H. Felt's *Kabalah of the Egyptians and the Greek Canon of Proportion*, or, as the title goes on to explain, "the normal law of being and of beauty applied to art, sculpture, architecture, symbolism, language, natural law, and science, and the deciphering of the hidden meaning of the sculptured and written Egyptian and Hebrew religious records." The book will consist of 640 quarto pages, with upwards of a thousand illustrations.

DR. HANS HILDEBRAND has favoured us with a letter intended to reassure would-be visitors to the Anthropological and Archaeological Congress to be held in Stockholm next August, who may have been terrified by reports of epidemic disease in that city. He assures them that the sanitary condition of Stockholm is now excellent.

A VALUABLE collection of books and MSS. has just been dispersed under the hammer of Messrs. Puttick and Simpson, of Leicester Square. The most prominent item in the sale was lot 216, *The Boke of Encyclos*, compiled by Vyrgyle, translated and printed by William Caxton, 1490, which, although wanting two pages, was knocked down for the sum of 191l. The following also realised high prices:—Lot 91, *Missale ad usum Ecclesie Sarisburiensis*, printed at Paris, 1515, 42l.; lot 92, *Psalterium Davidicum ad usum Ecclesie Sarisburiensis*, 1555, 19l. 15s.; lot 96, Beza's New Testament, Englished by Laurence Tomson, 1576, 13l.; lot 119, *The Life of St. Barbara*, an illuminated MS., 12l.; lot 125, Lauri, *Album Amicorum*, 1598-1640, 10l. 6s.; lot 132, Whittintoni *De Syllabarum Quantitatibus*, &c., printed by Wynken de Worde, 1519, 20l. 10s.; lot 147,

The Newe Testament, Tyndale's version, 1553, 16l. 15s.

THE eminent Swedish publicist, and editor of *Aftonbladet*, Dr. August Sohlman, was drowned on July 6; he was yachting in the Baltic, and a sudden squall upset his little vessel. He was a powerful swimmer, and would have been able to reach the shore, but for the exhausting efforts he made to save his little son.

A CORRESPONDENT transmits to us the following little record of old country credulity, extracted from an original news-letter, lately in his hands, dated at Coventry, August 28, 1671:—

"Here has been of late a strangely ridiculous and idle report about both our town and country, about the spiriting away of young children, who they say are to be killed for their blood to cure the French king of a leprosy, which absurd 'whimsey' has taken such impression amongst the vulgar and ignorant, that 'tis hard to dispossess them of the belief of its reality, insomuch that many parents as foolish as fond will not suffer their children to go to school."

A SIMILAR communication dated in March of the same year mentions a rumour of a "strange kind of sound or drumming in a well at a town called Hill Wootton, near Warwick," then to be heard. The inhabitants, moreover, affirmed that the same drum-like noise "beating several points of a march and a call most exactly" had been heard in 1642, just before the commencement of the civil war, and again just before the Restoration. The correspondent says that he had himself been over to the place to be informed of the truth of it, and had discussed the matter with the owner of the well ("one Nibbs," as he parenthetically explains), but was unable to detect the least sound of the kind. The entire body of inhabitants was, however, ready to swear that they had heard it within the previous fortnight.

IN our notice of the Historical MSS. Commission Report, a week or two since, it was somewhat inconsiderately set down that Shakspeare's *Richard II.* formed the subject of a conversation between Queen Elizabeth and William Lambarde. The extract given in the Report from the original notes on this subject runs thus:—

"1601. Aug. 4. . . . Speaking of Richard II. Lambarde referred to an attempt by an unkind gentleman the most adorned creature that ever your majestie made. The Queen said this tragedie was played 40 times in open streets and houses."

The probability seems to be that the allusion is to an earlier play, bearing a like title, regarding which Mr. Dyce has the following note:—

"An older play on the deposing of King Richard the Second was acted at the Globe in 1601. on the afternoon before Essex's insurrection, in the presence of Sir Gilly Merrick, and other of his partisans; 'neither was it casual, but a play bespoken by Merrick. And not so onely, but when it was told him by one of the players, that the play was olde, & that they should have losse in playing it, because fewe would come to it, there was fourtie shillings extraordinary giuen to play it, and so thereupon played it was.'"

This Mr. Dyce quotes from *A Declaration of the Practices and Treasons attempted and committed by Robert late Earle of Essex and his Complices*, &c. (1601.)

As it has been suggested that the context of Meres's quotation of Falstaff's "there is nothing but rogerie in villanous man," which we mentioned last week, must be taken to imply that Shakspeare, though a "mellifluous and hony-tongued" poet, was a crafty cheat, not to be compared to Drayton for virtue and decent life, we print the whole passage:—

"As *Aulus Persius Flaccus* is reported among all writers to be of an honest life and upright conversation: so *Michael Drayton* (*quem toties honoris & amoris causa nominio*) among schollers, souldiours, Poets, and all sorts of people, is helde for a man of vertuous disposition, honest conversation, and wel governed carriage, which is almost miraculous among good wits in these declining and corrupt times, when "there is

nothing but rogers in villanous man, & whea cheating and craftines is counted the cleanest wit, and soundest wiselome."

Now, it would certainly have been pleasant if Meres, when speaking of Shakspeare directly afterwards, had told us that he was as good as Drayton, and left no room for the inference that he was in 1598 as bad as others of the loose crew of actors and playwrights then in London. Yet, as Spenser was one of these "good wits" of whom Meres speaks, we may fairly hold that Shakspeare, though not a Milton or Wordsworth in morals, was an exception to the worthy Francis's sweeping condemnation of the poets of his time.

PERHAPS the most amusing thing in the first number of M. Henri Rochefort's *Lanterne* (London: Simpson and Co.), is the English into which it is translated. Here is a specimen:—

"Tout est calculé pour que nos ramiers arrivent le soir à leur pigeonnier, où un homme à nous les débarrassera de leur littérature; et l'abonné le plus irritable sera désarmé par la ponctualité apportée dans le service de son journal."

"All is so arranged that our 'Mercuries' shall arrive at night at their 'cot,' when a man in our employ will rid them of their literary load; and the most irascible of subscribers will be put about by the over-punctuality brought to bear in the delivery of his paper."

Here is a fragment in the style of a third-form boy:—

"It is meet, however, that this glorious personage, wounded, spoiled by the habit of commanding, should forsooth once a week at least learn the truth."

"Forsooth" is good, and there is something touching about "at least," recalling cheery memories of the Greek Delectus. But when this fun is exhausted, there is nothing very brilliant about *La Lanterne*. It casts, of course, a lurid light on Marshal MacMahon, who is not descended from Brian Boru, it seems, but from an Irish doctor. The doctor, however, may have come, like Barry Lyndon, from "the ould ancient kings of all." M. Rochefort has a passage of arms with M. Veuillot, who defends the Carlists for killing their prisoners, on the ground that such massacres are reprisals. M. Rochefort replies that the murder of the hostages in Paris might be called reprisals for fifteen thousand of the people slain by the artillery of Versailles. If he really thinks this an argument, he must be very easily satisfied, but the whole controversy has only the interest of a strife between the *Rock* and the *Church Herald*. And it is scarcely fair of M. Rochefort to abuse New Caledonia as a bad place for free emigrants. Of course he did not like it; but there is a respectable cricket club on the island, and the manners and customs of the natives are most interesting. Few peoples keep up so many of the earlier habits of our race. Cannibalism is by no means extinct, and there must be some curious reason for wearing no dress at all except armlets and bands round the ankles. We cannot blame M. Rochefort for neglecting these institutions, and the religion, doubtless instructive, of the New Caledonians. But he ought not to prejudice emigrants against a country so alluring to the anthropologist. On the whole, *La Lanterne* is much drearier than M. Karr's *Les Guêpes*, which is saying a good deal; but it will be much more popular if it is prohibited. But we hope it won't be prohibited, and that the pigeons who are to save the republican Capitol may return to their usual pastime of being missed by gallant sportsmen at Nice and Monaco.

THE *Quarterly Review* contains, beside a full and suggestive statistical article on the "State of the Church," two very noticeable papers on "Lord and Lady Nithsdale" and "King Victor and King Charles;" the first based on the recent sumptuous edition of the Maxwell papers, of which an account was given in the *ACADEMY*. The wandering uncomfortable life of the noble exiles is fully and skilfully illustrated; their discomfort seems to have

been considerably aggravated by the unthriftiness and shabbiness of Lord Nithsdale. The second, which is more important, is a *précis* of the account of the imprisonment of King Victor after his abdication, given in the recently-printed memoirs of De Blondel, the French ambassador at Turin at the time. According to this view, which seems to have been accepted at Paris and Madrid, King Victor's abdication had no more serious motive than failing health; and D'Ormea, who had first attracted his favour by swindling the Pope out of an unusually favourable concordat, determined to take advantage of the irritation the ex-king showed at the suspension of the weekly report of the business of the kingdom which it had been arranged his son should send him, to trump up a charge of a conspiracy to remove the crown by force, and so to frighten the Council and the young king into the extreme measure of the arrest and separation of the ex-king and his wife, which was accomplished under circumstances of great brutality. There can be no doubt of the importance of the new information to which the article calls attention; but as the narrative of the arrest confirms what was known of the uncontrollable character of King Victor's passions, it is less certain that the designs attributed to him were imaginary, than that the means adopted to defeat them were excessive: the whole subject requires further investigation.

THE *Edinburgh Review* contains an interesting but fragmentary article on the "Canon of Beauty in Greek Art," suggesting a new autometric modulus for comparing proportions, according to which the whole height of the figure should be divided into four cubits, twenty-four palms, ninety-six digits, and nine hundred and sixty lines, and the relative dimensions of each part expressed in terms of this scale. The measurements of previous writers are treated fully enough to satisfy readers already familiar with the subject, and there are interesting incidental observations on the change of proportion at different periods of life as corresponding with those at different periods of art, and on the curious variation of proportion in sculptured genii, though the writer does not discuss the obvious possibility that the feet and head were enlarged for mechanical reasons.

THE Norwegian Historical Society has published the first and most important volume of a complete edition of the poetical works of Petter Dass, never collected before. Dass, called the father of Norwegian poetry, was, like the first Danish poet, Kingo, of Scotch extraction. His father was a Peter Dundas, a burgher of Dundee, who came over to Bergen, about 1630, to escape the oppressive laws of Charles I. against the Presbyterians. He married into a good Norse family, and their eldest son was the poet, known to posterity as Petter Dass, born in 1647. Dass lived high up in Nordland, close under the Arctic Circle, and never travelled farther south than Bergen, where flourished the only literary life in Norway that was independent of Copenhagen. Petter Dass and his intimate friend, the gifted and beautiful poetess, Dorte Engelbrechtsdatter, were the first writers of genius that appeared in Norway. The poetess was twelve years older than Dass, and was in friendly communication with the literary world of Copenhagen, and especially with Kingo, before Dass came before the public. On her return to her house in Bergen they mutually stimulated one another, and while he gained something of her fluency and grace, he helped to preserve her style from the excessive affectation of the day. Dorte, who was called the eleventh Muse, Sappho being the tenth, is but little studied nowadays, while Dass is as popular as ever. His master-work is a kind of poetical description of life in the arctic provinces of Norway, and is called *Nordland's Trompet* (Nordland's Trumpet). This long poem is written in the most airy, lively style imaginable, is full of quaint, egotistic humour, and is quite invaluable as a photographic

picture of the times. Only in rare passages does it give proof of the imagination which Dass undoubtedly possessed, to discover which one must turn to his spiritual songs. *Nordland's Trompet*, however, is quite a unique work, and its extreme popularity, undiminished after two centuries, proves its inherent vitality. The new edition is beautifully got up, and edited in a very painstaking way by A. C. Eriksen, and the first volumes adorned with a portrait of the poet, which represents him with a domed forehead, long light curls, and handsome, massive features. The present volume contains the *Nordland's Trompet*, the Folk Songs and Rhymes, and a correspondence in verse with Dorte Engelbrechtsdatter and others. Two more volumes will follow.

THE new "Quarterly Statement" of the Palestine Exploration Fund contains another interesting batch of letters from M. Ganneau, which are, as the editor remarks, "full of inscriptions, legends, traditions, and suggestions." The most important features are his examination of the columns and balustrade of the Kubbet es Sakhra, and his excavations of the rock-built chambers north of the Via Dolorosa. His transliteration of Hebrew words is decidedly susceptible of improvement, as for instance when he speaks of the destroying angel "Melek (!) ha-Machhit." Nor can his etymological argument for identifying Kurn Sartabel with the spot referred to in Joshua v. 13-15, be pronounced other than highly fantastic. Lieutenant Conder contributes a paper on the identification of Aenon "near Salim;" he also offers an answer to the problem of the tells of Palestine, which he considers to be brick-making accumulations. He traces the victory and pursuit of Gideon (Judges vii.), identifying Zerzerath (a town, not, as he infers from our authorised version, a district) with Ain Zahrab. His argument in favour of Ras el Ain as the site of Herod's Antipatris may be read with the paper by Major Wilson on the same subject. This number also contains the last report from the late Mr. Tyrwhitt Drake, who speaks of the continued subsidence of the bottom of the Dead Sea. Lieutenant Conder gives some painfully interesting details on the circumstances connected with the death of his lamented friend and colleague.

NOTES OF TRAVEL.

THE Geographical Society of Paris has, according to the *Débats*, received information confirming the rumour of the death of M. Dournaux-Dupéré, who was conducting an expedition in the Sahara. The young traveller had advanced to Ghadamès by a route hitherto unknown to European explorers, and after a long stay there, he started for Ghât on April 12. When about five days' journey from Ghadamès, he was robbed and murdered, together with another French traveller, M. Joubert, by some deserters from the tribe of the Chamba. The news was brought by some Ghadaméans, who had themselves been robbed of their camels, and had seen the bodies of the French travellers lying on the road, and was transmitted to the French governor of the district of Tripoli. The crime seems to have been pre-arranged, through the treachery of Si-Nahécour-ben-Ettahar, one of M. Dournaux-Dupéré's guides, who has been handed over to the caimacan of Ghadamès, and by him delivered up to the French consul-general at Tripoli, who will send him to Algiers. The murder appears to have been committed on April 17 or 18.

THE Damascus correspondent of the *Levant Herald* describes a recent visit of English travellers to Palmyra, which throws much light on the state of the country between Damascus and the famous ruins.

"At first they kept along the high ridge of Jebel Kalamoun, exploring the fortress-convent of Saidenaya with its wonderful picture, said to have been painted by Saint Luke, and the half savage village of M'alula, whose houses are stuck against the rocks like wasps'

necks, and whose people, with those of three neighbouring villages, still speak a *patois* derived from the ancient Syriac. The rich harvest of manuscripts which existed in this region has been carefully gathered, and there only remained to be gleaned a few volumes of ecclesiastical legends in Greek, Estrangelo, and Karshouni, written on gazelle skins (rik) and on thick cotton paper. . . .

"Jebel Kalamoun is a limestone plateau where drought is permanent. Each village once had enormous flocks which found sufficient pasturage on the mountain declivities; besides which the cultivation of madder, and the collection of el kali, gave the people profitable employment. But by the discovery of a new dye, madder has greatly fallen in value, and the other resources of the peasants have been also cut off. This year, when Holo Pasha brought back the camels [which had been carried off by Arabs], there was scarcely a bushel of wheat in any house. Just then it was reported that there was wheat for sale at a place called El-Deir, near Euphrates. A market was soon opened at Palmyra, and thus the villages of Jebel Kalamoun have been kept from actual starvation.

"The travellers visited the wonderful vapour-baths near Havarin. At the summit of a hill $3\frac{1}{2}$ hours to the north of Kuryetein, they found extensive ruins and a large Roman reservoir.

"The tourists left Kuryetein on May 30, and an hour after sunrise the following morning Dabbous and his robbers passed over the place where they had encamped. From Kuryetein the tourists proceeded to Ain-el-Wu'ul, $8\frac{1}{2}$ hours from Kuryetein, and thence in 10 hours to the fine fountains Abu Fawaris, just outside the city of Zenobia. The existence of these fountains has been kept as secret as possible, in order that travellers might hire camels to carry water, but now that the springs are known, the difficulties of the journey will be considerably diminished.

"At Tadmor the party found the governor very obsequious until he succeeded, by many importunities, in getting from them a bottle of brandy. He then became rather disagreeable. He invited the tourists to dig for the antiquities, but when they were about to begin, he told them they could not commence unless they paid him £T.4.; he subsequently lowered his terms to £T.3. A body of the Amour Arabs under Kafley and Adab swept up towards the travellers in the ruins. They came on in fine style shaking their spears and shouting, but by an injudicious show of force on the part of the travellers, the Arabs were scared away at long range. They then wheeled round and made for the temple in which all the inhabitants of Palmyra now dwell. The people rushed to the gate with their matchlocks, and kept the Arabs out. The latter then called a halt in the triumphal arch, and the governor paid them a friendly visit. He and they are on very good terms, and lately they presented him with two of their best horses."

THERE is so much attention given to Icelandic matters this year, that Dr. Carter Blake's little pamphlet, *Sulphur in Iceland* (E. & F. N. Spon) comes at a most appropriate moment. It appears that the lakes in the north-east corner of that island, a district rarely visited by travellers, are surrounded by primrose-coloured mountains of pure sulphur; the large body of water called Myvatn is the centre of this district, and the hills on its eastern border are brilliantly yellow with the masses of sulphur with which their sides are thickly studded. In no part of the world is this substance found in such abundance, and Dr. Blake states that a given area in Iceland will produce ten times as much sulphur as the same area in that part of Italy from which at present the world is supplied. A British subject, Mr. Lock, has bought a concession of six square miles of the very heart of this district, the whole a mass of live sulphur; and if it be found possible to bring it down to the port of Husavik—a much-abused harbour, which Dr. Blake defends—there seems every reason to believe that it will richly repay any outlay of capital. The Icelandic Althing, with the "Home Rule" sentiments that distinguish that body, were anxious to wrap their treasure up in a napkin, and refused the concession; but the Danish Government overruled their decision, and Mr. Lock has come into possession of his solfatras, or sulphur springs. Dr.

Blake's pamphlet is very clear and concise, and illustrated with good maps.

M. DE LESSERS, calling the attention of the French Academy to the project of Captain Roudaire for improving the climate of Algeria by inundating a dry basin (bassin du Chott) and creating an artificial sea, invited M. Leverrier to contradict various absurd rumours of the mischief that would ensue from carrying out the design; one alarmist predicting that it would abolish the hot wind that melts the ice of the Swiss mountains, and cause that country to go back to the Glacial epoch! M. Leverrier replied that from the beneficial action of the little thread of water in the Suez Canal upon the adjacent district, where rain had fallen, it might be expected that the evaporation from a water-surface 300 kilometres long and 50 wide would provide an abundant rainfall for a district which the ancients had called the "granary of Italy." It was said that in the coming war budget, a credit of 25,000 francs would be demanded for levelling the ground between Riskara and the Gulf of Gabès.

ALL the newspapers in the east, north, and west of France unite in pronouncing this year's harvest a very prosperous one, and now the *Journal de Marseille* says the same of the south. A few hail-storms have done slight damage to the wheat and to the fruit-trees, but on the whole the abundant rain has proved beneficial. The wheat promises exceedingly well, the ear having formed under the most favourable conditions; the same may be also said of all the cereals. Hay and lucerne are of good quality, but there is not much of them; some trefail has been cut and gives satisfaction, but the greater part which has been left has been spoilt by the rain. Potatoes are everywhere in capital condition.

From Shanghai we hear that two large works have been published by order of the Inspector-General of Chinese Maritime Customs to illustrate the international exchange of products in connexion with the part taken by China in the Austro-Hungarian Universal Exhibition of 1873. One, a volume of over 500 pages quarto, gives the port catalogues of the Chinese Customs collection; the other, somewhat smaller, is devoted to the trade statistics of the same places. The catalogues give, in a succinct and clear form, the names in English and Chinese—and German also in the majority of cases—of the exhibits, remarks on their origin or method of preparation, the places of production and consumption, uses and value, and quantity imported or exported in 1871—thus forming a minute and comprehensive commercial dictionary of Chinese products.

It is reported that the Japanese expedition to Formosa is accompanied by a special correspondent of the *New York Tribune*.

MR. B. S. LYMAN, who has been making geological surveys for the Japanese Government, has sent home a preliminary report. Native surveyors were employed in the work, with only a single exception.

THE *Times* states that Henry Grinnell died at New York, on June 30, aged seventy-five years. He was the first President of the American Geographical Society, and originator of the first expedition in search of Franklin. One of Mr. Grinnell's whalers saved the famous ship *Resolute*, for which Congress, in 1855, voted an appropriation of \$40,000 to the salvors, and then returned the ship to Great Britain. The ship had been adrift for three or four years in the Arctic seas, and was received by Queen Victoria herself on its arrival in England. Mr. Grinnell absolutely refused to accept his lawful share of the salvage. Another of Mr. Grinnell's memorable shipping adventures was that of the *Euphrates*. The *Euphrates* was built before the war of 1812, and was run up the river at New Bedford for the purpose of being scuttled, an English vessel being in pursuit. The *Euphrates*

however, lived to be burnt by the *Shenandoah* in the great war of the rebellion. Again, in 1844, Mr. Grinnell built the *Henry Clay*, which was named after his great friend and leader. The *Henry Clay* was burnt at her dock in New York a few years later. Mr. Grinnell took Henry Clay down to view the charred timbers, the figure-head, strange to say, being the only part of the vessel which the fire had not touched. "That is the best likeness of an ugly man I ever saw," was the only comment of the great Whig statesman. Mr. Grinnell was not only an intimate friend of Henry Clay, but also of Daniel Webster. These two great personal friends accompanied him on a visit to Hell Gate, when, in 1846, he was, at his own expense, blasting the famous Pot Rock. He reduced the surface of the rock from 4 ft. to 10 ft. below low-water mark, spending a small fortune in the operation. Clay and Webster were both loud in their approbation, and told Mr. Grinnell that he was manufacturing the future water-ways of New York City. Mr. Grinnell was for thirty years a member of the great whale-ship firm now known as Grinnell, Minturn & Co.

M. FERDINAND DE LESSERS, at a recent meeting of the Geographical Society of Paris, gave some information with regard to the projected Central Asiatic railway, and the encouragement which he has received from the Czar and his ministers, and from influential persons in this country. M. Charles de Lesseps, after meeting with a favourable reception from the authorities in India, has visited Cashmere, and has proved the impracticability of the route originally proposed from Orenburg through Samarcand, the Hindoo Koosh, and the Cabool valley to Peshawur, chiefly due to the barbarous condition of the population of Afghanistan. M. Charles de Lesseps proposes therefore to adopt an easterly route, in connexion with the line in course of construction between Moscow and Siberia, through the Sir-Daria valley to Tashkend (which has flourished under the Russian régime, and now has a population of 200,000), skirting the lofty table-lands of Pamir, and passing thence to Kashgar, Yarkand, and Cashmere. The engineers considered this the safest route, especially as the new government at Cashmere seems determined to tread in the paths of civilization, and has given great facilities for trade, of which the English in India have not been slow to avail themselves. The route now proposed seems to lose in topographical advantages what it gains in safety of communication. It has to cross several lofty mountain-chains—the Monz-Dagh, the western spurs of the Kuen-Lun and Karakorum ranges, and the Himalayas. But the difficulties do not seem insuperable; and, if successful, this line will give fresh life to once powerful countries, and possibly change the face of the world.

JAMES THE SECOND AND MAGDALEN COLLEGE.

THE following letters, giving a contemporary account of the expulsion and subsequent restoration of the Fellows of Magdalen College, Oxford, will not be read without interest. The forced intrusion of Parker, Bishop of Oxford, into the Presidency, and the spirited conduct of Dr. Hough, the President, and of the Fellows, are known to everyone through the pages of Macaulay; James's tyrannical bearing in this instance doing "more than even the prosecution of the Bishops to alienate the Church of England from the throne." The writer was one Thomas Tramallier, of Jesus College, and the letters are addressed to, or written for the information of, Viscount Hatton.

E. MAUNDE THOMPSON.

I.

"Jesus College: October 27th, 1687.

"On Thursday last in the afternoon came hither the Ecclesiastical Commissioners, viz., the Bishop of Chester, the Lord Chief Justice Wright, and Baron Jenner; and the next day in the morning they went to Magdalen College Chapel; but that place not

pleasing them, they remov'd to the College Hall, where, according to a citation putt up on the College gate two days before, appear'd before them the President Dr Hough, the Fellows, with the rest of the Society. Their Commission was first read, empowering them to visit the Universities, particularly Magdalen College, the same in effect, mutatis mutandis, with the general Commission of that Court; and then the Bishop of Chester made a Speech, or a Charge, consisting for the most part of upbraiding Reflexions upon the Loyalty and behaviour of the College towards his Ma^y, with some exhortations to submit to the King's Mandate. In the afternoon they mett again; when Dr Hough declar'd to them in his name, and the name of the Society. That he own'd their Authority so far as it agreed with the Laws of the Land, and y^e Statutes of the College, and no further: telling them withall, That it was a hard thing they should undergoe a Visitation, at so short a warning. This Declaration of submitting no otherwise to their Visitation, as also of the hard measure he had, he afterwards confirm'd, among other arguments, by the Oath he had taken as President, which is indeed very solemne and express; and other Statutes of the College, which they are all sworn to observe; giving them an account of the whole Transaction; but particularly of the methods they had us'd to avoid their falling under the King's displeasure. In the mean while the Commission order'd several Papers to be read, concerning that affair, both from the Ecclesiastical Courts, and the College; askt questions to and fro, especially about the coming in of some of their Presidents by Mandates: to which sutable answers were return'd, and call'd for y^e Books and Registers, with other Instruments relating to the Estate of the College. One thing I must not omit, because indeed it was very singular: when Dr Hough insisted upon their obligation to observe the Statutes of y^e Coll: and told them it was his Resolution, by God's help, to do it; the Bp. askt him, why then they did not read Mass, according to the Statutes of the College? to which the Dr answering, That besides that Mass contain'd several impieties, it was contrary to the Laws of the Land; the Commissioners desir'd him to shew them to what Law; and the Acts of Uniformity being instant in, they all profess't, they could see no such thing in them; but all this was but skirmishing in respect of what was done on Saturday. That morning then the Commissioners, according to their adjournment, sate in the College Common room, whence all People were turn'd out; but being lett in again, after they had closeted the Dr for about an hour, the sentence of the Ecclesiastical Court was read thrice by the Bishop; which was to this effect, That he was declar'd no President, and was forthwith to deliver up the Keys. To this he answer'd, That he was perhaps the only instance in England since the Restauration, that was turn'd out of his property, without a legal Tryal, or so much as a Citation; and that he could not, nor would not part with his Right. In the afternoon the Fellows were call'd in, and being askt one by one, whether they would comply with the king's Mandate for the Bp. of Oxon? that being read to them; they all unanimously refus'd it, but two, Dr Tho. Smith, and Charnock. It happen'd a little before, as Dr Hough was Protesting against the Proceedings of the Commissioners, and appeal'd to the king and his Courts of Justice, that the People gave a Hem; for which they thought fitt to bind him over to Westminster in 2000 *lib.* bail. They talk't once of Committing him; though he told them, That by depriving him they had discharg'd him from looking after the College; and with [that] all the Fellows offer'd to take their oaths, that they were no way concern'd in it. My L^d Chief Justice was pleas'd to say, That if the Civil power could not keep us Civil, the Military should. It was a rude thing, without doubt; and therefore it was since condemn'd by a Programma from the Vice Chancellor. On Tuesday morning they sate again; but it was in order to admitt the Bishop of Oxford; which being not to be done by the Fellows, they did it in the person of his Chaplain; who, as his Proxy, took the Oaths, and was afterwards putt in possession of the President's Lodgings; but not without breaking open the doors, Dr Hough retaining still the keys. It was expected the Sheriff of the County would have bin concern'd in it, with the Posse Comitatus; or that y^e three Troopes of Horse which have been quarter'd here ever since the raising of the Army should have bin employ'd in that execution; but it was done in y^e manner that I relate,

whatever private Instructions they might have. In the Afternoon the [course] was chang'd; and the Bp. of Oxon being consider'd as possessor of the Presidentship, a new Question was putt to them, viz. Whether they would obey him now he was in by the King's Authority? To this the Fellows, Demyes, Chaplains, and others of the Foundation, answer'd, They would submit to him, as far as was consistent with the Statutes of the College; only two refus'd it absolutely, the Famous Dr Fairfax, and the Under Porter. The Dr moreover entering his Protestation in due forme of Law, was depriv'd instantly of his Fellowship, and commanded to depart the College within a fortnight; as the Under Porter was within three days. In the morning there was putt into the Court an answer to that doughty argument That the King's Mandate is an Inhibition; but they were wheedled off of it by some few sugar words, they then beginning to flinch. I was surpris'd, I must confess, to see it come to this; but I dare not judge them. This is plain, I think, That they have thereby shew'd the king a way to putt into every place; not to say, That in it's consequence it affects every man's Property in England. They pretend that they have herein follow'd the advice of their most judicious Friends; and that there was positive Order sent to turn out every man of them, that would not submit.

II.

"Jesus College: Nov. 17, 87.

"I presum'd about three weeks agoe to trouble your Lordship with a long tedious account of the Proceedings of the Ecclesiastical Commissioners at Magdalen College; and because they are return'd here again, I shall beg leave to continue my relation, of what has hapen'd since. I inform'd your Lordship then, as I apprehended it, and as I think, most people did that heard them, that the Fellows had submitted to the Bishop of Oxford, and that they would obey him as their President; but it seems we were mistaken; for on the Thursday following, when the Commissioners would have had then to subscribe a kind of Address of Submission, to be presented to his Ma^y, they putt in this final answer. May it please your L^{ships}, We have endeavour'd in all our actions to express our duty with all humility to his Ma^y; and being conscious to ourselves, that in the whole conduct of this business before your L^{ships} we have done nothing, but what our Oaths and Statutes indispensably oblige us to; we cannot make any Declaration, whereby to acknowledge that we have done amiss, as having acted according to the principles of Loyalty and obedience to his sacred Ma^y, as far as we could without doing violence to our consciences, and prejudice to our Rights (of which we humbly conceive this of electing our President to be one), from which we are sworn on noe account whatever to depart. We therefore humbly beg your L^{ships} to represent &c. Subscribed by all, but Dr. Thomas Smith and Charnock. Mr. Fullam, one of the Fellows, had the misfortune then to be suspended from his Fellowship by the Commissioners during the King's pleasure, for telling them that they had violently enter'd the President's lodgings, without the legal way by the Sheriff, and the Posse Comitatus. But on Tuesday they came hither again in the afternoon, and lodg'd that night at the Bp. of Oxon in Magdalen College; where yesterday morning they sate in the college Common Room, and the Fellows appear'd before them. The first thing that was done was, the reading of a couple of Mandates from the King, out of a bundle the Bp. of Chester held in hands, in favour of one Joyner, who was a Demye there above forty years agoe, and sold his place before the Troubles broke out; and one Alibone, a Student of St. Omers; but both Papists; and the admitting of them Fellows thereupon by the Commissioners, without taking any other Oath, but that of Fellow; the rest being dispens'd with by the Mandate. Then Chester, being the mouth of the Commissioners, made his Speech; where after a recapitulation of his former Charge and their Proceedings, he fell a railing most violently against the Fellows, calling them popular, petulant, obstinate, perverse, seditious, rebellious, forgetting all this while that he stands register'd at Queen's College, for having born arms against the King at Worcester. But amongst other his strange Doctrines I must not pass by one; for it is a piece of new Divinity, worthy the ambition of the Candidate of the Arch-Bishoprick of York; and it is this; he told the Fellows in the exhortative part of his Speech, That they must sacrifice

their Consciences, as a Peace-offering to the Father of their Country. After this there was an instrument product, containing the forme of a Submission, to which they were all requir'd to subscribe, except Dr Tho. Smith, of whom the Bp. was pleas'd to say, That his Ma^y, in consideration of his carriage in that whole affair, did graciously condescend, that it should not be putt to him; and Charnock: but they all refus'd it; for which they were presently after sentenc'd by the Court, five and twenty in number, to be depriv'd their Fellowships, and banish't the College. They were denied a Copy of the Instrument; but it was to this effect, that they should acknowledge themselves to have acted all along disloyally and disobediently, and beg the King's Pardon; and that they own'd the Bp. of Oxon as their lawful President, and would obey him accordingly. There were afterwards three new Fellows putt in by Mandates; and two Mandates more were offer'd, but not accepted of by the persons for whom they were design'd. The Fellows putt in their several Protestations; and the Commissioners went away in the Afternoon; but God only knows where that furious zeal will terminate."

III.

"Jesus College: November 1st, 1688.

"It is now about a twelve-month, that I writ to My Lord an account of the Visitation at Magdalen College, and the Ejection of that Society; I suppose his Lordship will not be displeased to hear of their Restauration, and therefore if you think it fitt, I shall desire you to read this to him. On Saturday last was sennight the Bishop of Winchester, as being Visitor of the College, in pursuance of an Order from the King forthwith to resettle the Society of Magdalen College, came hither; he was attended into the Town by above three hundred persons on horseback, most of them Scholars, and six or seven coaches, full of Noblemen and Doctors. The Solemnity was to be performed [the day] following; but to our great amazement his Lop. was gone on Sunday morning; it seems there came a Messenger from Court to summon him to the Council, to be present at the business of the Prince of Wales, as it appeared afterwards. But on the Wednesday in that week he came again; and the day following after Morning-Prayer in the Chapel, and a speech made to him by one of the Doctors of the House, producing the King's letter he completed the Resettlement. Things were putt in Statu quo; only Mr. Charnock was left out. And thus by the Providence of God, and upon a revolution of affairs, that honest and stout Society, which was designed to be the praeludium of further attempts, was restaur'd within the compass of about a year to it's full Rights and property; having first seen that illegal anti-Church of England Court, by which they had suffer'd, fully dissolv'd. The Bishop went for London, being to attend his Majesty to the Field. Mr. Walker, it is sayd, is going to resigne up his Headship of University; his Disciple, we hope, will follow his steps herein likewise at Christ Church."

CORRESPONDENCE.

ENGLISH SURNAMES.

Peckham: July 9, 1874.

If Mr. C. J. Robinson had investigated the subject of his communication more fully, he would not have appeared in the ACADEMY of the 27th ult. He seems little aware of what has been done in our onomatology within the past generation. I take to myself the credit of being the first person who ever wrote a separate treatise on our family nomenclature. Camden has a learned chapter on the subject in his *Remains*, and Verstegan, in his *Restitution*, has a distinct essay of comparatively little value. Subsequently a few cursory articles appeared in various periodical and other works. About forty years ago, when a mere youth, I devoted much time to the study, and read all that was known to exist upon the matter in the English language, and subsequently consulted some French essays which had a bearing on our family names. In 1842 appeared my *English Surnames, Essays on Family Nomenclature*, of which a fourth edition, two volumes 8vo, is now in the press. This work has been succeeded by two distinct volumes from other pens, but bearing the same title—1. *English Surnames, and their Place in the Teutonic Family*, by Robert Ferguson, 1858; and 2. *Our English Surnames, their Sources and Significations*, by C. W. Bardsley, M.A., 1873. During the present year has appeared an anonymous volume called *The Norman People*, which, though erroneous on some points—as all books of this nature must necessarily be—throws a great amount of light on the origin of the Norman names which exist so numerous in our midst. But the principal work as to bulk is my well-known *Patronymica Britannica: a Dictionary of the Family Names of the United Kingdom* (1860, royal 8vo, double columns, pp. 492), which contains many thousands of names, their origin and history. It had a large sale, and I am now preparing a greatly enlarged edition.

After these statements I hope Mr. Robinson will modify his notion, and see that English surnames have received not merely a moderate but a very large amount of attention at the hands of recent and still living writers. Let me assure Mr. Robinson that we shall never see a complete treatise on the subject, for, as Camden well observes, "To reduce Surnames to a method is matter for a Ramist, who should haply find it to be a Typocosmy."

MARK ANTONY LOWER, M.A., F.S.A.

[Mr. Lower has done much, but confesses that he has not exhausted the subject. It is almost too much for any one man, and Mr. Robinson's suggestion is still to the purpose, that contributions from all parts of England, if sent to one receiving centre, may at last result in the disclosure of some new materials.—EDITOR.]

THE CAMBRIDGE MANUSCRIPT OF THE SAMARITAN TARGUM.

Trinity College, Cambridge: July 14, 1874.

A sentence occurs in Mr. Cheyne's article on Mr. Nutt's edition of the fragment of the Samaritan Targum in the Bodleian Library which is calculated to lead to a misapprehension unless explained. It is as follows: "He [Mr. Nutt] hoped to have added another fragment from a MS. belonging to Trinity College, Cambridge; but, as is still too often the case in England, was unable to obtain the loan of the MS." The natural inference from this would be that the College had ungraciously refused to allow Mr. Nutt the use of the MS. As such an inference would do the College a great injustice, and as the whole blame, whatever there may be, rests with myself, I will explain what really has happened.

Some few years since Professor Lightfoot presented to the College Library a MS. of the Samaritan Pentateuch which he had procured from Nablus. With this was thrown in as a make-weight to the bargain a fragment of thirty leaves in small quarto, which was probably supposed by the vendor, Jacobus-Shellaby, to belong to another MS. of the text of the Pentateuch. Upon examining it, however, I discovered that it contained the Samaritan Targum of Leviticus complete, with the end of Exodus and the beginning of Numbers. This fact, together with some specimens of the glosses which occur in the MS., I communicated to M. Neubauer, who embodied it in an article he wrote for the *Journal Asiatique* in 1870. The MS. was in a very dilapidated condition, the edges being broken and injured by damp. When Mr. Nutt applied for the loan of it, the Master and Seniors decided that it must first be bound; and as in the process of binding it was possible that some parts might be rendered less legible, I was requested to copy it before placing it in the binder's hands. This I undertook to do, and have done. My first intention was to hand over my work, when completed, to Mr. Nutt; and with this view, in describing the MS. in the "Catalogue of Arabic, &c., Hebrew and Samaritan MSS. in the Library of Trinity College, Cambridge," published in 1870, I did not give a detailed account of it, on the ground that it would be edited by Mr. Nutt, stating this as the reason. But as the work went on, I found the labour of making out the faded letters, and of deciphering the glosses with which the MS. abounds, so considerable, that I was not disposed to give up the results, even to a friend, and preferred to edit the MS. myself. That it has not been published long since is due to the fact that my leisure for such studies is but scant, and grows scantier year by year. When it appears, I trust that it may be worthy of being a companion to Mr. Nutt's volume.

This explanation is of necessity rather long, but it will have served its end if it shall show that, whatever may be "still too often the case in England," such churlishness in refusing scholars access to its literary treasures is not characteristic of Trinity College, Cambridge. I know that, on the contrary, its liberality in this respect has been abused, that MSS. which were once in the College Library are now in the British Museum, and that others have disappeared entirely. I would add, moreover, that if the clause which I have quoted from Mr. Cheyne's article was suggested by his own experience, he must have been singularly unfortunate; and all that I have known of libraries and private owners of MSS. would lead me to the opposite conclusion.

WILLIAM ALDIS WRIGHT.

PROCTOR'S "UNIVERSE AND COMING TRANSITS."

12, Royal Parade, Blackheath:
 July 20, 1874.

Mr. Proctor's views, as explained in his last letter, agree so closely with my own, that I can only express my regret at having misunderstood him when, like many others, I inferred from former statements of his that he wished stations to be chosen for Halley's method instead of those selected by Sir G. Airy. At the same time it strikes me that with regard to the two methods Mr. Proctor is somewhat in the position of those who try to make the best of both worlds if they can. All ambiguity would perhaps have been removed if Mr. Proctor had originally defined the term Halleyan station as that at which both "ingress and egress will be worked up by Delisle's method," which is, as I gather from his two letters, the sense in which he uses the words.

Although Mr. Proctor has "had no difficulty in obtaining information as to foreign arrangements," he tacitly accepts my corrections with the single exception of the statement about Crozet Island. It is rather strange that such an ex-

cellent map-maker should have overlooked the fact that others may make use of a map to settle practical points which can hardly be reduced to figures. A glance at a map will show that the Americans can visit Crozet Island, without the least trouble, on their way to Kerguelen Island, the prior claim of the English to the latter station having been acknowledged by both Germans and Americans, in the event of their succeeding in finding other suitable stations.

The insinuations against the Astronomer Royal require no notice. But perhaps these are some of the recondite jests for which Mr. Proctor is by this time so famous. W. H. M. CHRISTIE.

[We can insert no further correspondence on this subject.—EDITOR.]

THE EARLIEST KNOWN SPECIMEN OF THE GIPSY LANGUAGE.

3 St. George's Square, N.W.: July 21, 1874.

Mr. E. A. Freeman has so often reproved me in print for the shockingness of my conduct in waltzing with fair-haired young ladies during holidays in the country, while I was editing *Andrew Boorde* (1870), that I desire to mention a most lamentable result of the practice which has just come to my knowledge, as well for the justification of my censor, as for a warning to all other editors.

Dr. Zupitza, of Vienna, has lately pointed out the sad fact that I mist seeing in Andrew Boorde's specimens of the Egyptian language in 1542, the earliest known specimen of the Gipsy. Dr. Zupitza told this to his friend, Professor Franz Miklosich, who was about to lecture on the subject in the philosophico-historical classes at the "Kaiserliche Akademie der Wissenschaften" in Vienna; and, in the printed prospectus of his lectures, the Professor has referred to Boorde's book as the really oldest of the hitherto known specimens of the Gipsy language.

Boorde's specimen and account of the people are so short, that perhaps you will print both, though I rely on the honour of every Gipsy-loving man who reads them to buy the book at Trübner's, (it is really the most quaint and interesting book on Europe and England written in Henry VIII.'s reign) and thus help our Early English Text Society, to which everybody ought to subscribe, and only five hundred bodies do:—

"The people of the country be swarte, and doth go disgrisyd in theyr apparel, contrary to other nacyns; they be lyght fyngerd, and vse pyking;* they haue litle maner, and euyl loggyng. & yet they be pleas(a)unt dausers. Ther be few or none of the Egipcions that doth dwell in Egypt, for Egypt is repleted now with infydele alyons. There mony is brasse and golde. Yf there be any man that wyl learne parte of theyr speche, Englyshe and Egypt speche followeth.

Good morow! Lach illur ydyues!
 How farro is it to the next towne? Cater myla barforas?

You be welcome to the towne. Maysta ves barforas.
 Wyl you drynke some wine? Mole pis lauena?

I wyl go wyth you. A euatosa.

Sit you downe, and dryncke. Hyste len pee.

Drynke, drynke, for God sake! pe, pe, deue lasse!

Mayde, geue me bread and wyne! Achae, da mai

manor la vue!

Geue me fleshe! Da mai masse!

Mayde, come hyther! harke a worde! Achae, a wordcy

susse!

Geue me aples and peeres! Da mai paba la ambrell!

Much good do it you! Iche misto!

Good nyght! Lachira tut!" (pp. 217-18.)

I fear that "Andrew Boorde, of Physycke, Doctour," had not visited Egypt. But on a somewhat like question to that between Mr. Freeman and me, the Doctor utters an opinion that I quote with entire sympathy:—

* Cf. "picking and stealing."

"I have gone rownde aboute Crystendome, and oerthwarte Crystendom, & a thousande or two and more myles out of Crystendom, yet there is not so moche pleasure for harte & hynde, bucke and doo, and for roo bucke and doo, as is in Englande; & although the flesshe be dysprayed in physycke, I pray God to sende me parte of the flesshe to eate, physycke not-withstandyng. . . . all Physycyons sayth that venyson . . . doth ingender coloryke humours; & of truneth it doth so: wherefore let them take the skyn, and let me have the flesshe" (pp. 274-5).

Let Mr. Freeman take the work in the country, and let me have the fair-haired friends, the walks, the pulls, and the waltzes (p. 110). Broiling here, I long for them now. F. J. FURNIVALL.

THE AUXILIARY "DO."

1 Oppidans Road, Primrose Hill, N.W. : July, 15, 1874.

It may perhaps help to show how quite distinct the auxiliary use of *do* is from the *proverbial*, if we notice that in Latin *facio* may be found used proverbially but not as an auxiliary. Thus, Virg. *Ecl.* ii. 43-44:—

* Jam pridem a me illos abducere Thestylis orat;
Et faciet, quoniam sordent tibi munera nostra."

Here *faciet* is exactly "he shall do so;" it is equivalent to "abducat," as Forbiger notes. The only instance I see in Faccioliati—but I am much mistaken if others besides that just quoted do not exist—is from Tac. *Dial.* 19: "Nam quatenus antiquorum admiratores hunc velut terminum antiquitatis constituere solent, quem usque ad Cassium Severum faciunt quem primum affirmant flexisse ab illa vetere atque dicendi recta via," &c.; but it is just possible *faciunt* may have its full meaning here, and not merely stand for "constituunt."

J. W. HALES.

SCIENCE.

Der Paulinismus. Ein Beitrag zur Geschichte der urchristlichen Theologie. Von Otto Pfleiderer. (Leipzig, 1873.)

THE great difficulty in the way of understanding St. Paul is, for the ordinary reader, the tendency to import into his writings our own ideas, and, in short, to find only what we bring; for the critic, the temptation to exact from him a greater logical consistency and a more coherent scheme of thought than, in writings produced under the influence of strong feeling, and adapted to special occasions, it is natural to expect, or than can actually be found. Paul was the native of a city famous in the ancient world as a seat of learning, and second only to Athens itself; and to whatever extent he may have enjoyed the advantage of the Greek culture available to him there, it can scarcely be that the intellectual atmosphere which he breathed as a boy should not have exercised some influence on his subsequent development. But he was a Jew—a Hebrew of the Hebrews—and profited in the Jews' religion above his equals, being more exceedingly zealous of the traditions of his fathers. He was a man, it is plain from his writings, of great intensity of thought, of vivid imagination and great fervency of feeling, for whom, accordingly, the subjective ever tended to become the objective, the abstract to pass into the concrete, and words to take the place of things, and who was so far under the dominion of words as to be sometimes in danger of being carried away by them. There is no doubt, however, that Paul had a system, though it may not have been a perfectly consistent one, if indeed any system ever was. There is a certain range of thought,

embracing the whole universe in its relations to God, through which he moves. There are certain dominant terms, constantly recurring, round which his mind revolves. To fix the value of these terms, and determine the mutual relations of the ideas they represent is the business of exegetical criticism. Professor Pfleiderer, in the admirable work before me, seems to me to err in too entirely disowning the influence of Greek thought, and especially of the Jewish-Alexandrine speculation, on the mind of Paul. That, however, is a matter of detail. Generally speaking, his work is an exposition of the Pauline theology in its original form and subsequent development down to the reconciliation of the two opposing tendencies—Pauline and Jewish Christianity—in Catholicism, which, for clearness of form, insight, and competent learning, leaves little or nothing to be desired.

What was the *genesis* of the Pauline system? Paul's gospel, in its decided rejection of the Jewish law, was broadly distinguished from that of the Twelve. That it came to him by revelation is his own statement, and that it was not derived from the elder apostles its independence of them is a guarantee. What, however, were the logical and psychological conditions which prepared the way for his conversion? Pfleiderer, in his introduction, expresses his dissatisfaction with the now favourite theory that Paul's doctrine of the inefficacy of the law originated in the consciousness of his own inability to fulfil its demands, and asks us to consider what a difference there is between the subjective feeling of one's own defective righteousness, and the objective persuasion that righteousness generally is impossible. A Jew, he argues, however much he might be convinced of his personal failure to fulfil the law, would never conclude thence that the law—the divinity of which he never questioned—was given with any other view than that it might be fulfilled, and man by its means be brought into a state of righteousness before God. Even if he felt that man could never fulfil the law so perfectly as to need no atonement, this persuasion would lead him to see in the death of Christ an addition to the law only, but by no means an abrogation of it. And, in fact, this was precisely the conclusion of the Jewish Christians, who also believed in the atoning death of Christ, but far from regarding it as involving the abolition of the law, treated the inference of Paul as an error by which Christ was made the minister of sin. With the Jewish Christians, then, Christ's death was a subordinate point. A crucified Messiah, that stumbling-block to the Jews, was a paradox which they endeavoured to smooth over as best they might. With Paul, on the contrary, this was the fundamental idea of his whole conception of the gospel. The death of the Messiah, if it was to have its full effect as an atoning sacrifice, would logically involve the abolition of the law, and the fact and its consequences were both given to Paul in the same supreme moment, at his conversion, as he himself says (Gal. ii. 21), "If righteousness come by the law, then Christ is dead in vain." That the Messiah should die *in vain* was a thought not for a moment to be entertained, and

therefore no alternative was left but either to reject Jesus and persecute his followers, or admit the reality of the sacrifice with its utmost consequences. Paul, according to Pfleiderer, must have been long familiar with the arguments of the Christians. He could neither deny the force of those arguments, so far as they were founded on Scripture, nor doubt the possibility at least of the alleged appearances of the risen Jesus. For the psychology of that day there was no middle course between accepting the facts, and regarding those who affirmed them as intentional liars. But there was nothing in the conduct of the Christians to suggest imposture, and to their strong convictions, for which moreover they were ready to die, Paul had nothing to oppose but his own subjective feeling, his instinctive horror of a crucified Messiah. In this way, however, and the more unable he found himself to answer the arguments of the Christians, the sharper appeared the contradiction between a crucified Messiah and Judaism. It was the *interest* of Paul to think out this contradiction to its extreme results, because the greater it was, the more was he justified in his persecution of the disciples.

"Thus it becomes quite naturally intelligible that Paul, previous to his conversion, felt the fundamental irreconcilableness of faith in the crucified and of the old legal religion far more sharply and clearly than any one of the older disciples before him; it was precisely the old hatred of the Pharisee for the suffering Messiah which enabled him to see so clearly the full consequences of the new faith in the crucified."

This line of remark suggests the following considerations:—Pfleiderer seems to regard Paul's doctrine of the abolition of the law through Christ as an *inference* from which there was no escape when once he had admitted the crucified Jesus to be the Messiah. The crucified was, *ipso facto*, under the curse of the law ("for it is written, Cursed is everyone that hangeth on a tree," Gal. iii. 13, comp. Deut. xxi. 23); how then could he be a sacrifice according to the law and supplementary to it? If a sacrifice at all, then as one so completely contrary to the law it must be also as one in which the law was forever abolished. Admitting the legitimacy of the argument, it may still be asked, Is it so obvious that it must have pressed itself irresistibly on the mind of Paul, especially when we consider that its force was not felt by the elder apostles, and if they ever heard of it, it failed to convince them. True, Pfleiderer lays great and just stress on Paul's Pharisaism; but was Paul the only Pharisee who became a Christian, and if so, what becomes of the Pharisees mentioned in Acts xv. as urging, in the Jerusalem Church, that it was needful to circumcise the Gentiles, and to command them to keep the law of Moses? Had they not read "Cursed is everyone that hangeth on a tree"; and, in fact, is not Paul's reference to that text a good deal in his usual style of quoting Scripture to support a foregone conclusion? Pfleiderer's position, I may remark, would be much more consistent if he did not maintain that the Jewish Christians regarded Christ's death as a sacrifice. That they did so before the appearance of Paul there is no proof, unless, indeed, we suppose that the

doctrine was taught by Jesus himself. But what certainty is there that he ever used the words ascribed to him in Matthew xxvi. 28, if indeed these words must be understood in a sacrificial sense? Again, admitting to the fullest extent the correctness of Pfleiderer's remarks—and I am far from denying their value—there is nothing in this view inconsistent with the idea that Paul's profound sense of the inadequacy of the law in his own case had much influence in the way of preparing his mind for its ultimate rejection. He had read in his Bible the terrible sentence, which we may well suppose preyed upon his mind, "Cursed is everyone that continueth not in all things that are written in the book of the law to do them," and after all it was no such rash inference to conclude that righteousness was impossible for man. *He* had done his best. He had had every advantage, and yet he was deeply conscious that he had failed. It might have been unnatural, or rather it would have been impossible, for him to conclude at once that therefore the law was never designed for justification; but when a remedy against its curse was freely offered, how natural to accept it as a full and complete one! Once more, I venture to doubt whether either of these views is adequate, or both in combination, to account for St. Paul's conversion, without reference to those Hellenic surroundings, the influence of which his master Gamaliel acknowledged. The conversion of Paul cannot be explained psychologically on the ground of Pharisaism alone. It was the rebound of a nature originally broad, sympathetic and human, from the narrow legalism by whose forms it had for a time, from purely conscientious motives, consented to be bound. It was the self-assertion, in the person of Paul, the Hellenic Jew, of the new universalism which was then abroad in the world, against the old Hebrew particularism. Undoubtedly, there were many subtle links, far more than it is possible to trace, between Paul's Christian teaching and his previous life, and we may be thankful for every new light thrown upon any of them; but unless there had been a certain element of heathenism mixed with his Jewish blood, or, at any rate, affecting his intellectual character, would he ever have been precisely what he was?

Meantime, we have not got beyond the Introduction; but to follow our author minutely through his very elaborate and admirable exposition of the Pauline theology or even to give a satisfactory summary of it, in the space here available, would be obviously impossible. The first chapter on Sin and the Law furnishes a good illustration of Paul's method of handling abstract ideas, as well as of his occasional logical incoherence. In Rom. vii. sin is represented as an active principle rooted in man's flesh, and belonging to its nature; while in Rom. iv., on the contrary, it appears as the consequence of a particular transgression—the disobedience of Adam, who, on the other view, would have been condemned previous to any actual sin. The attempt, indeed, has been made to reconcile these opposite theories by assuming that by the fall man's nature was changed; but of this, argues Pfleiderer, there is no trace. The truth is, that in one passage

Paul writes as a Platonist, in the other as a Jew. Pfleiderer will not allow that Paul teaches the doctrine of inherited corruption. But neither, of course, does he ascribe to him the rationalistic theory of merely personal sin. In the view of Paul, Adam was the head and moral representative of the human race, and accordingly, in virtue of his sin, the whole of humanity passed at once into the condition of sinners before God—a somewhat harsh idea, but one for which Paul was not altogether responsible.

Passing over the valuable section on the Law, which for Paul meant all the Mosaic enactments, without distinction of moral and ritual, and even the whole of the Old Testament, we now come to the second chapter on Redemption through Christ's death. According to Jewish ideas, life only could atone for sin, but it was indifferent *whose* life was sacrificed, whether that of the sinner, or of a victim substituted for him. Vicarious atonement is undeniably the ground idea of the old Semitic rite of redeeming the first-born by a slain lamb, and it was on this principle accordingly that Christ, as the lamb of God, was slain on behalf of mankind. Christ, however, did not, in this, become the *object* of the Divine wrath, but merely endured, as an outward infliction, the sufferings due to sinners. The idea, Pfleiderer thinks, came from Jesus himself; rightly, it may be, if Matt. xxvi. 28 be historical. But why, if God desired to show forth his love by the forgiveness of sin, was this sacrifice ever insisted on? The obvious answer to this question, that the law required the punishment of death, and must be fulfilled, Pfleiderer rejects as inconsistent with Paul's view of the law as a merely temporary institution. The law, according to the apostle, was designed to prepare for the gospel; it was valid only between the promise and the fulfilment; how then could it possibly extend its claims beyond the point at which the fulfilment had commenced? If, then, Paul had set out with assuming the temporary character of the law, and had reasoned consequentially from that assumption, he would never have arrived at the conclusion that Christ's death was sacrificial. But this was by no means the case. For Paul, as for every Jew, the law was of unconditional validity. It was the death of Christ, regarded as an atoning sacrifice, which first revealed its temporary character, while, at the same time, this very notion of the necessity of an atoning sacrifice was itself based on the assumption of the eternal validity of the law. The contradiction, evident to us, was not so to its author; but it was the deepest reason why the Pauline system could not be maintained in the Church in its original form. The successors of Paul started from the point which he had with difficulty attained, of regarding the law as degraded and set aside, and had no need therefore to attempt to reconcile Christ's worth with its claims.

The next chapter, on the Person of Christ, is an important and interesting one. The risen and glorified Jesus—the immediate object of Paul's faith—was the Son of God (proved so by the resurrection) in virtue of a spirit of holiness (Rom. i. 4), which was no accident—not something imparted to him

at his baptism, as the Jewish Christians believed—but which constituted the essence of his personality. Only on this condition could he be free from sin, if his spirit was directly from God—a holy spirit. This being so, the person of the Messiah was different from every other person. This divine origin, moreover, implied his pre-existence, and as the heavenly man (1 Cor. xv. 45–47) Christ had existed prior to his manifestation on earth (from all eternity?), and had acted as mediator between God and his people (1 Cor. x. 4), as well as at the creation of the world (1 Cor. viii. 6). For this last passage cannot be referred, with some, merely to the scheme of redemption, and equally vain is the attempt to explain 2 Cor. viii. 9 by Christ's earthly experience, as if it meant, "Though he was rich in spiritual goods, yet for your sakes he submitted to temporal poverty." Paul sometimes refers the manifestation of Christ to his own act (2 Cor. viii. 9; Phil. ii. 7, 8), sometimes to the Divine will (Rom. viii. 3, &c.), but in either case he points unmistakably to a state of pre-existent glory. Paul, however, is far from placing Christ on an equality with God; on the contrary, his lordship over the Church presupposes his unconditional subordination to God. (Cf. 1 Cor. iii. 23 and xi. 3; Phil. ii. 9, 11; 1 Cor. xv. 24, 28). Pfleiderer agrees with Weiss, against most of the modern critics, in refusing to allow any indebtedness on the part of Paul, in reference to this subject, to Jewish or Alexandrine philosophical notions, such as the Ideal man, or the "Adam Kadmon." "Paul" he remarks, with considerable justice, "drew his Christian ideas from the originality of his own Christianspirit, and not from foreign philosophical systems" (p. 143). And again, very truly, "The whole of the pre-existence idea was the reflection, thrown back into the past, of the image under which the fancy of Paul and of the whole Church represented the exalted and glorified Christ living in heaven" (p. 141). To these statements I should see no objection provided they are not understood as precluding a general influence of the Jewish Alexandrine speculation on the Pauline system. The originality of Paul's genius assuredly will not be denied! But how precisely Paul came to leave behind the Jewish Messiah, and preach a Son of God sent from heaven to redeem mankind, and though whom, moreover, the world was made, is a problem which can scarcely be solved, scientifically, by assuming a purely Jewish stand-point.

The next chapter is on Justification by Faith, in which it is shown that faith, in Paul's view, is primarily simply belief that God has sent his Son; this faith, however, implies love, and hence follows the mystical union with Christ. Justification, which is *not* a making righteous, but a pronouncing righteous, is, Pfleiderer maintains, a divine act once for all accomplished. It is not a *process*, and in fact it would be nearer the apostle's sense to regard justification in general as an act preceding individual justification. Passing over two very interesting chapters on Life in the Spirit, and the Christian Church, we can at present only briefly notice the concluding sections of the first part on the Parusia and the End of the World. Least of

all in relation to these subjects do we find in Paul perfectly definite and consistent ideas; rather, we see him adhering firmly to the Jewish-Christian eschatology, but at the same time combining with it, though without any attempt at reconciliation, those more spiritual views which were subsequently developed in the Johannine writings. The resurrection body is at one time a development of the earthly body, into which it will be changed; at another time it is "our house which is from heaven," and related to the earthly body like a new garment to an old one. So, when Paul contemplates the Parusia as close at hand (1 Cor. xv. 52; 1 Thess. iv. 15, 17), it is easy for him to think of entering at once into life eternal, without concerning himself with the question, "In what state shall we be between death and the resurrection?" Sometimes, no doubt, this state is spoken of as a "sleep." At other times, even when death, and not the Parusia is in contemplation (2 Cor. v. 1-5; Phil. iii. 10, 14), there is no reference to any intervening state, and here accordingly the Jewish eschatology is unconsciously abandoned, and "the Christian idea of the development within the soul of the higher life already present therein" put in its place. Surely, however, if 2 Cor. v. begins with a reference to the dissolution of the body by death, the apostle passes immediately to the thought of a supernatural change, which could be effected only by the coming of the Lord. Another striking inconsistency is Paul's retention of the Jewish doctrine of retribution—a judgment day, when every man shall receive according to the deeds done in the body (2 Cor. v. 10), which Pfeiderer thinks is entirely irreconcilable with the rest of the Pauline system, especially with the doctrine of grace.

The resurrection of Christians and the last judgment follow immediately on the Parusia, but are by no means "the end." Paul, like the author of the Apocalypse, believed in two resurrections, and between the Parusia and the end of the world assumed a period of time—not, however, of a thousand years, but of indefinite duration—when Christ would rule in visible glory and put all enemies under his feet. This follows plainly from 1 Cor. xv. 23, *sqq.*, where the "end" is unmistakably distinguished from the first resurrection. We have here, in fact, a regular series indicated in the words ἀπαρχή—ἐπείτα—ἐπειτα—"Christ, the first fruits," then, "they that are Christ's at his coming," after that "the end," when all the dead shall rise, and when Christ shall deliver up the Kingdom to his Father. The reign of Christ obviously requires a lapse of time, and the "end," when he shall resign his kingdom to his Father, is certainly to be distinguished from the Parusia, when he enters upon it. The view indeed has its difficulties. A second judgment seems to be required for those who had no part in the first resurrection. The first judgment seems to be made of none effect; else, who are the enemies that remain for Christ to overcome? The writer of the Apocalypse represents the reign of Christ as a time of peace, when Satan shall be bound; but Paul plainly implies that it will be a time of war. All that need be said is that these inconsistencies did not occur to the apostle. Instead of adopting any of the

numberless combinations and hypotheses which have been proposed to explain them, it is better to admit that we have here simply another example of the co-existence in the mind of Paul of irreconcilable ideas—that of the Parusia accomplishing the world's deliverance by a sudden act of Divine power, and that of a redemption to be worked out by a gradual process of development.

It will be evident from all that has been said that Pfeiderer writes with entire independence of all modern systems of theology. It is perhaps needless to add, that he considers Paul's theory of the "end," when "the Son himself shall be subject unto him that put all things under him," impossible to reconcile with the Church doctrine of the Trinity.

The second part of this valuable work, tracing the development of Paulinism, may perhaps be considered on another occasion.

ROBERT B. DRUMMOND.

A Treatise on the Use of the Tenses in Hebrew. By S. R. Driver, M.A., Fellow of New College. (Oxford: at the Clarendon Press, 1874.)

THIS volume will be very acceptable to Hebrew students. It treats in a masterly way one of the most difficult subjects in Hebrew grammar. The author has carefully studied the works of the great German scholars, particularly those of Ewald and Böttcher; but he has also examined and thought for himself, and his treatise bears in every part the stamp of independence and thoroughness.

It is distributed into ten chapters, the first of which (1) is introductory; and the others treat of (2) the Perfect alone; (3) the Imperfect alone; (4) the Cohortative and Jussive; (5) the Voluntative with *waw*; (6) the Imperfect with strong *waw* or *waw* conversive; (7) the Accents; (8) the Perfect with *waw* conversive; (9) the Perfect and Imperfect with weak *waw*; and (10) Hypotheticals. To which there are added three Appendices: (1) on the Circumstantial Clause; (2) on the Original Signification of the Jussive; and (3) on Arabic as illustrative of Hebrew. Under each of these heads, the author states his views with singular clearness, and illustrates them by numerous examples. The only chapter in which there is any superfluous matter is the seventh, which might with advantage be abbreviated, or altogether omitted, in a second edition.

Mr. Driver's theory of the tenses is substantially that of Ewald, as is indicated by his adoption of the names *Perfect* and *Imperfect*. The former he takes to denote *completed* action, in whatever sphere of time; and his discussion of the use of this tense, both when it stands alone, and when preceded by *ו*, whether consecutive or simply copulative, leaves scarcely anything to be desired. The latter, he thinks, denotes primarily *incipient* action, whether in the past, the present, or the future. In this view he coincides rather with Böttcher than with Ewald, who, in his account of the tense, begins with the idea of *incompleteness*, and thence deduces its other uses. Perhaps it is impossible to express by means of a

single word the radical idea of the Hebrew imperfect or future, which stands in antithesis to the perfect, and bears to it a relation somewhat analogous to that of the abstract to the concrete noun.

With the notion of *incipient*, Mr. Driver connects that of *progressive* (repeated, habitual) action, which the imperfect also expresses. This use of the tense, both by itself and in combination with the equivalent form *לָקַח*, has long been well known, though it is not unfrequently overlooked by English expositors. For example, the *Speaker's Commentary* still retains the story, so familiar to our childhood, of David's single-handed encounter with a lion and a bear, whilst a youthful shepherd tending his father's flocks (1 Sam. xvii. 34-36). But, in the Hebrew text, the whole structure of the narrative (particularly the combination of tenses employed by the writer), evidently points not to one but to repeated encounters, sometimes with the one, sometimes with the other, of those enemies of the flock. An accurate exposition of this and similar passages will be found in the *Observationes Philolog. Exeg.* (Amsterdam, 1755) of Koolhaas, whose labours in this department of Hebrew grammar must not be forgotten. Mr. Driver, who gives numerous examples of this usage, remarks in explanation of it, "that an action of which it may be predicated that it is beginning or ready to take place, is in the nature of things likely to happen more frequently." This is not quite satisfactory, and seems to show that the primary signification of *incipiency*, which he assumes for the tense, is too limited.

Exception may also be taken to Mr. Driver's view of the origin of the cohortative and jussive forms of the future. The *-ah* termination of the former, he thinks, was originally "merely *intensive*, and not specially *cohortative* or *intentional*" (§ 70). And, as to the latter, finding "formidable difficulties" in the way of accepting the usual theory of its origin, he has come to the conclusion that these difficulties will disappear if, "instead of beginning with the idea of a command, we assume rather that the jussive was at first a special modification designed to emphasize the idea of potentiality or contingency which we know to belong to the imperfect" (§ 175). To discuss these views fully would occupy too much space. They have been propounded with the laudable desire of furnishing an explanation of some of the exceptional phenomena of the language. But it is questionable whether explanations of the forms of a language should be sought for in such phenomena rather than in common usage. And, as to the particular phenomena in question, it is by no means clear that they admit of explanation more easily on Mr. Driver's hypothesis than on that which is commonly received by grammarians.

But, while acknowledging our inability to accept some of Mr. Driver's theoretical views, and likewise reserving our assent to his exposition of some particular passages, we desire, at the same time, to express, as strongly as we can, our appreciation of the

ability and value of his treatise. To all students of Hebrew, however advanced, it will prove instructive and suggestive; to those who are unable to consult the principal grammars in the German language, it is simply indispensable. Mr. Driver had already, in a previous work, done good service in the field of Hebrew scholarship; and his present volume heightens our expectations of his future services.

DUNCAN H. WEIR.

NOTES AND NEWS.

Variations of Blood Pressure in different parts of the Body.—The invention by Marey of the instrument termed the sphygmoscope or sphygmograph enabled the physiologist to take accurate tracings of the form of the pulse-wave, but gave only indirect and insufficient evidence of the amount of pressure exerted by the blood against the walls of the vessels. To supply this defect Professor Fick, of Zürich (*Vorhandlung der Würzburger Phys.-med. Gesellschaft*, band iv., 1873, p. 223), has made a series of experiments with a manometer and revolving drum tracing apparatus on dogs, to determine the nature and amount of the difference of pressure under which the blood moves in different parts of the system. He finds that in the larger arteries the blood-pressure rises very rapidly at the commencement of the pulse-wave, and then gradually falls to its original level. In the right auricle the pressure varies to a very slight extent, and usually stands at zero, or, in other words, is equal to our atmosphere. The action of the heart has little influence upon it, and it is somewhat remarkable that the contraction of the right ventricle has more effect in augmenting the pressure than the contraction of its own walls. The respiratory movements cause distinct variations of the pressure in the right auricle, expiration causing it to be increased, inspiration to fall as much as 10 mm. of mercury below zero. When the manometer was placed in the right ventricle, the pressure rose during its systole to between 18 and 42 millimètres of mercury. An important point noticed was that after the systole the pressure fell considerably below zero, showing clearly that the walls expanded actively and exerted a kind of aspiratory power. The pressure in the left ventricle amounted to 140 mm. of mercury during the systole. The pressure rose to the same height in the aorta, but never fell so low, on account of the closure of the valves of the aorta. During very rapid action of the heart the pressure in the ventricle fell below its previous amount.

Influence of Nerve Lesions upon Temperature.—Dr. S. Weir Mitchell, in a paper on this subject in Brown Séquard's *Archives of Medicine* (No. 4), states that he has recently made a number of experiments to confirm the views of Waller as to the influence of cold upon the functions of nerves. The nerve chosen was the ulnar, which he tried to freeze with a rhigolene spray, but only caused temporary effects on the nerve and somewhat lasting annoyances in the way of a superficial slough of the skin. He was more fortunate with mixtures of ice and salt, in which he kept his elbow until the nerve was frozen. His results were the same as those of Waller; but he compares them in an interesting manner with the effects of section of the nerve. When a main nerve is cut, he observes, the parts which it innervates rise in temperature, but apparently lose heat and becomes permanently cooler after the lapse of weeks or months. When a nerve has been slightly cooled the temperature of the tissues related to its terminal filaments falls somewhat, and where men are exposed to severe general cold, this must help to chill the surface of the entire skin.

In local freezing of the ulnar nerve, as it ceases to be painfully affected and anaesthesia comes on, the included vaso-motor nerves also cease to be

irritated or to act at all; and under this paralytic influence the heat rises in the ulnar part of the palm two to four degrees, while the part becomes red and swollen. It occurred to Dr. Mitchell that the proper use of these facts might enable him to determine absolutely whether the nerves exert on the tissues any direct action productive of a rise of temperature, or whether it is due solely to their power of altering the size of the bloodvessels—a question which has given rise to much difference of opinion. Dr. Mitchell's experiments were thus made:—The ulnar palm temperature was taken first; then he held his hand suspended above his head for ten minutes, till it grew quite pale, while the blood was repeatedly pressed towards the centres by properly-directed pressure with the other hand. Next a tourniquet was placed around the arm, and the arterial and venous circulation arrested. Again the temperature was taken, and noted once more, while the elbow was acted on by a freezing mixture. The general result obtained in all the experiments was that the check of blood-flow, and the reduction of the amount of blood in the limb to a minimum, prevented the rise of temperature which usually follows freezing of the nerve. The rise must, therefore, depend solely on variations in the size of the vessels, due to palsy of vaso-motor filaments, and not to any direct influence of the nerve on the tissues.

Bite of the Viper.—At the last meeting of the Academy of Medicine of Paris (June 23, 1874), M. Le Roy de Méricourt communicated a paper which gave rise to an animated discussion on the employment of intra-venous injections of ammonia in the treatment of bites by vipers. It is well known that the subcutaneous injection of ammonia, introduced by Dr. Halford, of Melbourne, has proved very successful in his hands. Practitioners in India, however, have not expressed themselves strongly in favour of it. Perhaps this may be due to the greater malignity and swiftness of action of the poison of the Indian as opposed to the Australian serpents. In the case of the Australian reptiles, the ammonia may have time to overtake and neutralise the poison before it has exerted a fatal action on the central nervous system, whereas in the case of the most dreaded of the Indian snakes the action is so rapid, that before the remedy can be applied the lethal effects have been produced, and the sufferer is moribund. Some allowance must also be made for differences in the subject, the patients in India being chiefly the feeble-bodied Hindoo, whilst in Melbourne the sufferers are usually the stronger constitutioned European. Lastly, some difference in the result obtained may be due to the mode in which the ammonia is injected, Professor Halford throwing in rather strong doses as rapidly as possible after the bite, whilst in some non-successful cases a good deal of time has been lost. M. de Méricourt pronounces against the utility of ammoniacal injections, and formulates his ideas in the following propositions: 1. The only effective means, the use of which should be generally and popularly known, are those which prevent the absorption of the poison immediately after the bite, viz., ligature above the part bitten, suction, lotions, cauterisation by means of a red-hot needle or of a small heap of gunpowder placed on the wound, or the application of some coagulating caustic. 2. If these means have been neglected, or have been applied tardily and ineffectually, hot alcoholic drinks should be given gradually and in a methodical manner, so that sweating and the elimination of fluids by the kidneys may be induced as freely as possible. The action of the new sudorific "jaborandi" may be tried. 3. If in consequence of violent vomiting the introduction of medicine by the stomach be prevented, and any confidence be still retained by the practitioner in the use of ammonia, he may practise it, as it is at least harmless. The bite of the viper in France appears to be occasionally fatal. M. Robin mentioned, in the discussion which followed the reading of the paper, one fatal

case which had occurred in his experience. Other speakers also alluded to fatal cases that had fallen under their notice.

Centres of the Vascular and Respiratory Centres.—A résumé of recent researches on these centres is given in the *Centralblatt* (No. 16, 1874). Dittmar, who has worked in the Physiological Institute of Leipzig, essentially corroborates the previous statements of Owsjannikow, whose method of experiment, namely, by making sections through the medulla oblongata, he has improved. Dittmar found (in rabbits) that the inferior limit of the vaso-motor centre was at a plane about three millimètres above the point of the calamus scriptorius. The upper limit was at about the upper border of the corpus trapezoides. This region corresponds to the place of origin of the nervi faciales. In Dittmar's experiments the blood-pressure was determined by the kymographion, and its rise after irritation of the sciatic nerve constituted a measure as to the extent to which the vaso-motor reflex centre had been eliminated by the section made. Sections showed that the sensory nerves, at least of the sciatic nerve (the irritation of which caused a rise of the blood-pressure), as well as the vaso-motor nerves themselves, ran in the lateral columns. Moreover, the centre on both sides lies in that part of the medulla oblongata which corresponds to the lateral column of the spinal cord, more particularly, however, in the anterior part of the same. Microscopic investigation showed this region to have a grey nucleus containing large multipolar ganglion cells, which has been designated by Dean and Kölliker as the inferior diffuse part of the superior olivary body; and by Clarke as the "antero-lateral nucleus."

Schlesinger and Oser, whilst admitting the medulla oblongata to be the essential centre of the vaso-motor nerves, point out that both vascular and motor nerves proceed from the spinal cord. After separation of the brain from the medulla, the spinal centres are greatly enfeebled; but by the injection of strychnia their energy may to a certain extent be reawakened, and even after section of the spinal cord in the neck strychnia causes considerable elevation of blood-pressure and energetic uterine contractions.

Rokitansky found that respiratory movements could still be performed by rabbits after section of the cervical region of the spinal cord, if strychnia were administered, and he therefore concludes that there are respiratory centres in the cord, the functional activity of which, however, is ordinarily dependent on their connexion with the brain.

A FOSSIL discovered by M. Sismonda, and preserved as unique in the University of Turin, has been determined by Professor W. Schimper to be *Annularia sphenophylloides*, a plant likely to have been aquatic. Only one group of verticillate leaves was preserved, converted into anthracite. It was imbedded in a mass of protogine (the granite of Mont Blanc), broken off from an erratic mass, and its presence in such a situation can only be accounted for by assigning an aqueous origin to the protogine.

At the Botanical Congress recently held at Florence, M. Alphonse de Candolle discoursed on the origin of the vegetation of the Alps, his idea being that localities rich in rare or numerous species were those in which the glacial period soonest passed away. He considers that the southern portion of the chain disengaged from the glaciers when all Switzerland was still covered by them, preserved the remains of an ancient alpine or sub-alpine flora which joined on to the modern vegetation. In other cases antiquity is the cause of this richness, as for example the Cape and Brazil compared with the poverty of new islands, or arctic regions lately under ice.

M. PLANCHON gives the following account in the *Revue des Deux Mondes* of the discussion at

the Botanical Congress at Florence concerning the supposed parasitic character of the gonidia of lichens:—

"The question was to decide the true nature of lichens, those singular organisms which cover with foliaceous or fruticulate expansions, or with divers coloured crusts, the bark of trees, rocks, or even the soil. Whatever may be their external colour—dead white, grey, bluish, greenish, yellow, or orange—these lichens always exhibit in the substance of their *thallus* (as their various expansions are called) a certain number of granulations, or rather of green cellules, more rarely yellow, blue, or brown. These are called *gonidia*. The surrounding tissue, called *hypha*, is formed of filamentous colourless cells, composing a felted web, and the gonidia are sharply distinguished from it by their colour. The gonidia were for a long time regarded as essential constituents of the lichens. More lately their resemblance to some of the lower algae living on the ground, on stones, or on bark, suggested the singular idea that they might actually be algae entangled in the tissue of the lichens and connected with their life by links that remained to be discovered. Was it a simple cohabitation, commensalism (fellow boarding), if we may employ a term applied to certain associations of animals, such, for example, as that between oysters and the little crustaceans known to Aristotle as *xinnotherae*? Or, on the contrary, was there a mutual dependence between the lichen and the algae, and if so, which was the parasite, the lichen or the algae? The first hypothesis has little *a priori* probability, as the different algae with which the gonidia had been identified are known as living independently when away from the lichen tissue. The parasitism of the lichen on the algae, or, to speak more correctly, of the filamentous hypha upon the gonidia, seemed to follow from the fact that the filaments of the hyphae are in a manner implanted among the gonidia, which they embrace in their folds, applying themselves to their surfaces, adhering to their membranes, and apparently exercising a debilitating action, diminishing their size, and hampering their evolution. These and other facts have led M. de Bary in Germany, and M. Schwendener, of Bale, to admit the parasitism of the lichen on the algae which its tissue enfolds. According to this theory the lichen is a complex being, or rather a compound of two beings, of which one, the foundation, is an algae, and the other a sort of fungus living at the expense of the former, an hypothesis without doubt very bold, even paradoxical, but which, if opposed by learned lichenographers like Dr. Nylander, has found an emphatic defender in Dr. Bornet, of Antibes, whose admirable micrographic labours in this department have made him a great authority. It was after having seen, as I did, the beautiful microscopic preparations of Dr. Bornet, that Dr. Weddell, correspondent of the Academy of Sciences, brought the subject before the Congress at Florence. While confident that the gonidia are algae, he holds in reserve the question of the parasitism of the hypha upon them."

We have given the above as being an intelligible popular account of a curious theory. The other side of the question is not explained by M. Planchon, but it must not be inferred that the theory he espouses, and which originated with Schwendener, is generally accepted by lichenologists. A *résumé* of the arguments for and against the hypothesis will be found (as we stated in a former number) in the *Popular Science Review* for July, in which the Rev. J. M. Crombie represents the balance of evidence as decidedly against it.

PROFESSOR GALLE has called our attention to an error into which we have fallen through a misapprehension of his meaning, in an account we gave of a recent paper of his in the *Astronomische Nachrichten*, on the orbit of a large meteor. The effect of the earth's attraction appears to have been fully allowed for, and we regret that through the smallness of the correction we were led to conclude that it had been neglected.

MR. A. H. GREEN, M.A., late Fellow of Gonville and Caius College, Cambridge, has been appointed Professor of Geology in the Yorkshire College of Science. Mr. Green has for many years been attached to the Geological Survey, and has been chiefly engaged in working out the

structure of the Yorkshire coal-field. He is therefore peculiarly fitted by his local knowledge to occupy the new chair at Leeds.

THE Indian Government has now for several years carried on the work of examining all public and private libraries in India, with a view of determining the exact amount of ancient literature which is still extant in manuscripts. Dr. Bühler, Mr. Burnell, Rajendralal Mitra, and others have been employed in the different Presidencies, and the result has been most satisfactory. It has been shown that the bulk of Sanskrit literature exceeds that of Greek or Roman literature, but, on the other hand, it can no longer admit of any doubt that no MS. in India can claim a much higher age than the twelfth century A.D. MSS. of that date are, in fact, extremely rare, and we hear that the Secretary of State for India has just sent out a despatch to order a number of the most ancient and important Sanskrit MSS. lately discovered in India, to be sent to England, in order to have them exhibited at the International Congress of Orientalists in September. Dr. Rost, the learned Librarian of the India Office, will exhibit at the same time some of the most valuable treasures of his own collection, which, in its present locality, is but little known to the public at large.

M. ABRAHAM FIRKOWITSCH, well known in connexion with rare Hebrew manuscripts, died recently at the age of eighty-eight. He has left a splendid collection of no less than 1,500 MSS., which rivals, if it does not surpass, the fine collection of Hebrew-Arabic codices at Oxford. M. Neubauer and others have drawn attention to the great value of the Firkowitsch fragments of ancient MSS. of the Old Testament, both for various readings of the Hebrew text and for the Masora. We are glad to learn that the second volume of the work described by M. Neubauer in a recent number of the ACADEMY is quite ready for publication.

DR. VOLCK's discourse *On the Importance of Semitic Philology for Old Testament Exegesis* (Dorpat, 1874) is a most superficial performance, and will not even serve the purpose of a convenient repertory of facts. Those who touch Assyrian and Egyptian matters should either be experts or constant readers of the periodical literature in which the latest discoveries are embodied. An English scholar would, at least, have had the modesty to leave such a trivial attempt unprinted.

A REVIEWER in the Leipzig organ *Centralblatt*, June 27, with the transparent initials of Th. Nöldeke, gives a cautious and instructive criticism of Dr. Schrader's recent work on *The Descent to Hades of the Goddess Ishtar* (Giessen, 1874). He writes from the point of view of a trained Semitic scholar, and there can be no doubt of his intimate acquaintance with the laws and usages of the better known Semitic languages. He admits (which is much from a German philologist) the soundness of the basis on which the inscriptions have been interpreted, but professes an exaggerated scepticism on points of detail, which a few weeks' study of the subject would assuredly diminish. And yet the article deserves to be taken to heart by those whom it especially concerns, the Assyriologists, whose dogmatism and unscientific philology repel many students, and embarrass the course of many more. From a careful reading of Dr. Schrader's earlier work on the cuneiform inscriptions in relation to the Old Testament (Giessen, 1872), we suspect that Dr. Nöldeke's unfavourable verdict on the exegetical and especially the philological part of this new work is well founded. Rash and impossible etymologies abound in the one, and, judging from Dr. Nöldeke's examples, are not uncommon in the other work. At the same time the reviewer admits that Dr. Schrader has made an important contribution to the study of the subject, and remarks that the mythological ideas of these documents correspond remarkably with those of the

Mandaean literature on which he has been so long and zealously engaged. Would that our English Assyriologists, so learned and ingenious, and yet so weak on the whole in philology, might take the hint conveyed by Dr. Nöldeke: *Chi va piano va sano*.

M. DELAUNAY, whose communications to the Institute of France have been repeatedly noticed in these pages, has published the results of his researches on *Monks and Sibyls in Judæo-Greek Antiquity* (Paris, 1874). The first part is devoted to the origin, doctrines, and rites of Jewish monachism, and closes with the translation of the surprising work in which Philo describes the contemplative life of the Judæo-Alexandrine monks, the Therapeutae. The second part contains a history of the Sibylline oracles, not only of those which are of Alexandrine origin, but of those which have constituted the most ancient form of Greek poetry. It has also a translation of the eight hundred verses, hitherto merged in the collection of Jewish or Christian oracles, which an attentive examination has led the author to attach to the Judæo-Alexandrine cycle of literature. The work is interesting in its bearing on the question of the historical evolution of Christian ideas.

FINE ART.

Numismatique de la Terre Sainte. Par F. de Saulcy. (Paris: J. Rothschild, 1874.)

FOR half a century the gallant author of this splendid work has devoted himself to numismatic researches, interrupted only by occasional excursions into other archaeological fields. He has rescued from chaos the coinages of Gaul and Judæa, of Byzantium and the Crusaders, besides contributing very much to the arrangement and explanation of those of Spain and other parts. Of the coins of the kings of Judæa he has treated in his work published in 1854, a work which preceded, and to a great extent furnished the materials for, the researches of Reichardt, Madden, and others. The present volume, written in England, and inscribed to Mr. Poole, of the British Museum, is a complete account of all the coins of Palestine which have fallen under M. de Saulcy's observation. We add the qualification because he avows, in a regrettable passage of his preface, that his personal hostility to Germany has prevented him from taking any steps to examine pieces in the German museums. Probably he may not have missed very much, but in the case of a work so complete as the present every lacuna is noted, and it is a pity that M. de Saulcy did not sacrifice the excited feelings of the moment to his well-known love of knowledge. Science is of no country.

The success of the Palestine Exploration Fund would prove, if it were not daily forced on our observation, how intense is the interest taken by the English nation, and indeed all Christians, in every object having even the remotest connexion with the Jewish and Christian histories. Hence the attention bestowed usually on the coinage of Judæa, an attention which intrinsically it scarcely merits. The only coins in the whole series which an unbiased numismatist would consider interesting are the shekels ascribed by M. de Saulcy to Jaddua, high priest at the time of Alexander's conquest, and by most numismatists to the Maccabean princes. But we are all biased, and study the worn morsels of copper issued by the later kings with ever

fresh interest. The reason for the want of interest in the civic coins of which the present volume treats is not far to seek. Until the Roman conquest the towns of Judaea did not issue coins at all. Under the early Caesars, that is, before the destruction of Jerusalem, the gold coinage of the country was Roman, the silver coinage either Roman or belonging to the Phoenician towns on the sea coast, the copper coinage Roman, mixed with the coins of the few towns which had the right of striking copper, and the very small pieces issued by the kings and the procurators. But of course the mint-cities were in no case allowed to choose anything like a national type for their coins: we have palm-trees, trophies, implements of Roman cult and Greek divinities in monotonous succession; little to indicate a Jewish rather than an Arabian or Pisidian mint. As we have before remarked, the coins of the kings are not treated of in the present volume, but those of the procurators may delay us for a moment. M. de Saulcy has accepted the suggestion of Mommsen that the dates engraved on these coins may be the "anni Augustorum," not the years of the Actian æra, as he supposed in 1854. Repeated travels in the Holy Land have enriched his collection with pieces of almost all years in which the procurators could have struck, and he records, with pardonable pride, his possession of coins of the sixteenth, seventeenth, and eighteenth years of the reign of Tiberius, the years when, as he supposes, Pontius Pilate was ruling in Jerusalem, and our Lord was preaching through Palestine. But M. de Saulcy gives no reason for including in this part of his work the coins of the procurators of Judaea, while excluding those of Herod and Agrippa. Does he suppose them to have been current only in Jerusalem? This is surely unlikely, yet he has arranged them among the civic coins of that city.

About the memorable year 70 we find for a moment a coinage which might in one sense be called national; but it is the utter defeat of the Jews which it commemorates, and it was issued by the Roman commander. We may mention one curious, and we think unpublished, coin of this class, the reverse of which is thus described by M. de Saulcy: "[N]ΕΙΚΟΠΟΛΕΩΣ, Un loup et un porc combattant. C'est le loup qui mord vigoureusement le groin du porc, qui est placé dans une attitude simplement défensive." Here the wolf, of course, represents the Roman legions, the hog the Jewish people. This coin renders it highly probable that the city of Nicopolis, its place of mintage, was so named in honour of the victory of Titus; its former name having been Emmaüs. Cassiodorus and St. Jerome both assert the change of name to have taken place in the reign of Elagabalus; but the present coin is strong evidence the other way, and is supported by the probable attribution to the place of a coin of Faustina the younger, which also bears the name of Nicopolis.

After the destruction of Jerusalem the Jewish coinage becomes more varied and wide-spread, but less interesting, for at this period Judaea was scarcely more Jewish than were Cyprus and Egypt. Probably the most attractive series of this period for most per-

sons is that of Neapolis in Samaria. The usual type of this city is the Mount Gerizim, on which the Samaritans kept up, as to this day they keep up, their peculiar worship. It is thus figured:—

"Une montagne conique, à large base, est divisée au sommet en deux cimes bien distinctes, dont l'une, celle de gauche, supporte un temple à fronton orné de colonnes dont le nombre varie; la cime de droite, au contraire, ne supporte qu'un très-petit édifice de forme peu déterminée, mais sans colonnes. Un escalier monte directement de la base au sommet, et, à l'entrée du temple, orné de colonnes. Plusieurs édifices se montrent sur les flancs de l'escalier et le long de son trajet; quant à la base de la montagne, elle est munie d'une longue colonnade qui la garnit tout entière."

It is unfortunate that ancient coins are seldom accurate in their representations of architectural details. The number of columns, even the style of architecture, will be unhesitatingly sacrificed to the engraver's sense of the fitness of things. Thus, in the present instance, the huge staircase must surely symbolize a path or road up the mountain; and we find it hard to believe that the Samaritans would worship in a temple of Greek or Roman style. This same want of accuracy diminishes the interest naturally attaching to the representations of the great temples of Heliopolis or Baulbec, on the excavation and restoration of which M. Joyau is at present engaged; and to several other plans of temples in Damascus, Abila, and elsewhere, which figure in the coinage of Judaea. To pass from architecture to comparative mythology very interesting hints are thrown out by coins of Arabia and Palestine of a national Arabian pantheon, the scattered traces of which should be carefully collected. The armed deities, for example, which appear in the civic coinages of Damascus and Rabbath Moba, and which are both identified by M. de Saulcy with Mars or Ares, seem to be rather district heroes or war gods. Another remarkable figure belongs to the coinage of Dium, a male simulacrum between two recumbent bulls. The determination of the sites of the various cities is a work of great labour and research, but producing valuable results. To this specially the author has devoted himself, undertaking many laborious excursions into the Syrian and Arabian deserts. He is proud of being no closet-scholar, but one who has gathered his own materials slowly and painfully on the spot. Hence his excellent habit of indicating, where possible, the spot where each piece was found. We must not entirely pass over a very remarkable series of autonomous coins of Palmyra. The discovery of this coinage of the city is, we believe, entirely due to M. de Saulcy. He has described above fifty examples of it, and some of the types are of a character to interest students of the brief but brilliant history of the city.

To numismatists this work is of great importance. A detailed account of all the coins of any district or province of the ancient world is an excellent work; and there are few writers who combine numismatic ardour with the learning and experience of M. de Saulcy. In a work of detail there is little chance of wide-reaching and fundamental errors, but we have noticed many slight defects of detail. For example,

at p. 113 we find a coin described under the head of Caesarea in Samaria, which from its fabric should apparently be attributed to Caesarea in Bithynia. A much more serious defect is the apparent want of any means of referring from the text of the work to the plates which accompany it, and from the plates to the text. It is a work of time and labour to discover which of the pieces described are engraved and which are not, and as the order of the towns in the plates is different from that in the text, and there is no index to the former, the utility of the whole work is to some extent compromised. The plates are executed by Dardel in his usual careful and accurate, but somewhat monotonous and meaningless style. It is very much to be hoped that the gallant gentleman who has given us this work will be enabled to carry out the rest of his design: "Il ne me restera plus qu'à donner un catalogue raisonné des monnaies royales de cette même Palestine, pour avoir entièrement rempli le cadre qui embrasse la numismatique antique de cette terre illustre entre toutes." PERCY GARDNER.

A VISIT TO PIENZA.

THE annals of the Roman Pontificate in the fifteenth century present on the one hand a dark and repulsive, on the other a bright and noble aspect. The Popes who reigned from 1404 to 1500—Paul, Sixtus, Innocent, Alexander—became responsible for that bias, determined with evil results to their office and their credit, which led to the secularising of the spirit and aims, the general deterioration of the character and influences, thenceforth distinguishing the Papacy during the ante-Reformation period. Among those more estimable men raised to its supreme chair prior to 1400, the two who especially represent the worthier phase in the life of the Papal sovereignty, and who sought to reconcile the Roman Church, as well as their own true interests, with modern thought and culture, are Nicholas V. (elected 1447) and Pius II. (1458).

Aeneas Sylvius Piccolomini was the scion of a patrician but at the time of his birth impoverished family of Siena, and was born at a small town in the Val d'Orcia (so called from the river watering that valley), about thirty-two miles distant, south-eastward, from that Tuscan city. At Corsignano, as the little town was named, the family had settled for economy's sake, the parents of Aeneas having numerous offspring and little of this world's goods. The amiable manners and talents of the youth early attracted notice, and gradually won for him the high prizes first of the secular, and afterwards of the ecclesiastical career upon which he entered. Appointed secretary to the Cardinal Bishop of Bologna (Albergati, who was beatified), and charged by him with a political mission to Scotland, for effecting the desirable reconciliation between its king, James II., and Henry VI., king of England, the young Piccolomini saw many lands on a long and somewhat disastrous journey. Next we find him in the service of the ex-Duke of Savoy, Amadeo, who had been inauspiciously elected Pope (1442) by the Council of Basle, as Felix II., in rivalry against Eugenius IV. When the cause of that Antipope was declining, the Emperor Frederick engaged his talented secretary for an important diplomatic mission, with the object of offering friendship and support to the much-tried Pontiff who was legitimately elected at Rome. Eugenius died soon after the arrival of the Emperor's envoy at that city. Nicholas V., his successor, recognising the abilities and merits of Piccolomini, appointed him first to the post of "Apostolic Secretary," next to the bishopric of Trieste, and finally

to the archbishopric of Siena. Callixtus III., successor to Nicholas on the Papal throne, added the cardinal's hat to these honours; and, after that Pope's death, Cardinal Piccolomini, then fifty-three years of age, was elected in his place (August 1458), assuming the name of Pius II.

I have not here to consider this Pontiff's merits as a writer or as a theologian, in both which capacities he distinguished himself, though not constant to his originally avowed principles in the latter, the theological, character. The public works, the architectural creations accomplished by him, are my present subject. Marked by the distinguishing stamp of the Renaissance at its best Italian phase, and favourably contrasting with the pseudo-Renaissance of later periods, a style so glaringly conspicuous at Rome and Naples, the buildings raised by Pius II. are still (even in the decayed state into which many have fallen) among the monuments best entitled to the regard of the studious, but comparatively little noticed by the tourist class in Italy. Exceptional, however, is the fate of those at Siena, where the edifices due to the Piccolomini Pope are conspicuous and well-known—the majestic and nobly characterised palace built for his relations, but now applied to magisterial uses as the “palazzo del Governo;” and, near it, the loggia with round-arched portico and columns (reminding not a little of that, superior indeed, called after the architect Orcagna, at Florence) erected 1460, and dedicated “gentilibus suis” by the patriotic Pontiff; the architect of both palace and loggia being the renowned Francesco di Giorgio.

Still more noteworthy are the erections of Pius II. at the formerly insignificant little town, his birth-place, in Val d'Orcia. Corsignano is first mentioned in the ninth century. Remains of its feudal period, dilapidated walls and towered gateways, still exist; and the old church, SS. Vito e Modesto, once collegiate, in which the Aeneas Sylvius of such high destinies was baptized, is a mediæval building, with a crypt, supposed to date from the twelfth century. After he had been raised to the highest rank in the Church, this Pope first visited his native town in 1459, on his journey to Mantua, for the convocation of that congress of princes and ambassadors through which he hoped to attain what was his main object, fervently and bravely pursued throughout the six years' pontificate of Pius II.—a crusade against the Turks, and the rescue of Constantinople from their dominion. During that sojourn at Corsignano he ordered the undertaking of the public edifices and *palazzi* which have given a completely new aspect, one may say an historic importance, to the place, and which (we learn from the Pontiff's own words) were almost completed, after not more than three years' labours, before he arrived for another stay at this town, with several cardinals, in 1462. The architect engaged for all these buildings was Bernardo Rossellini, a Sienese. His undertaking comprised a cathedral, a *canonica* (or adjacent residence for canons), a palace for the Piccolomini family, an episcopal palace, and a *pretorio*, or magisterial residence, with offices, tribunals, prisons. Rossellini had estimated the cost at 10,000 gold florins (namely, for the cathedral alone, as Pope Pius's own report seems to imply), but the expenditure to which he actually went was more than 50,000. During that sojourn in 1462 the Pope held a consistory with his attendant cardinals, and therein publicly proclaimed his native town to be raised to the rank of a city with a bishopric, its name being changed from Corsignano to the commemorative one, Pienza, after himself. The See was declared to be in immediate dependence on the Papacy, subject to no other metropolitan. Shortly afterwards Pius II. consecrated the new *duomo*, with the assistance of a distinguished French cardinal, Estouteville. In 1496 this bishopric was bestowed on another Piccolomini, the nephew of that Pope, who was also raised to the pontifical sovereignty, in 1503, as Pius III. The succession of bishops, with the history of the

Pienza Cathedral up to the middle of the seventeenth century, is given by Ughelli in his *Italia Sacra*. In 1502 the city, and probably its public buildings also, suffered much from military occupation, that of Cesare Borgia with considerable forces (lawless and ferocious, we may imagine), on their march to support the pretensions and the party of Pandolfo Petruccio at Siena.

A striking picture of the renovated Pienza and its new embellishments is supplied by him who may be called its second founder as well as greatest benefactor. Pius II. himself dictated to secretaries, in a curious and interesting work, almost autobiographic, the *Commentarii Pii Secundi*, in the later years of his life, near the close of his unfortunately short pontificate. This was in the original judiciously altered, and portions of it omitted, by one favourite amanuensis, and at last published under the name of Gobelinus, a German priest, in the form in which alone we now possess this literary treasure, mutilated but still important and valuable. I have before me the edition brought out at Rome in 1584, and dedicated to Pope Gregory XIII. The illustrious writer, with natural complacency, extols the beauties and dwells at length on the details of his public works at his native place. The *duomo*, he tells us, was finished (namely, as he found it in 1462), all but one-third of the campanile, which was to rise to the height of 160 feet; the façade of travertine stonework, with pilasters, arched recesses for statues, three portals, and pyramidal sky-line, being complete; its elevation 72 feet. The interior, divided by columns into three naves, each of the same altitude, under vaulting painted blue and studded with gold stars, he describes as suited to excite religious feeling, a reverential awe such as modern Italian churches usually fail to produce in the mind (“*ipsa templi facies commotionem mentis et religionis quandam reverentiam excitat intrantibus*”). He further describes the rich details of this interior—the episcopal throne and sedilia in the semicircular apse, the gracefully sculptured tabernacle for the Holy Sacrament, and aediculae over the altars (of which there were four), as well as the paintings he had caused to be hung over those altars, all by distinguished masters of Siena. The new Piccolomini palace is the subject of still fuller description, and must have been (or would have been if maintained as the founder intended) a very *beau idéal* of the Italian palazzo, classical in style, splendid but not gorgeous in ornamentation. Its founder reports of it as seen by him, complete on three sides only of the quadrangle marked out in the plan; the circumference 540 feet, the elevation 90 feet, the whole construction of regularly hewn travertine stone, the “*cortile*” surrounded with a portico of three orders, the second of these three storeys with colonnades being adorned with paintings, the columns all monoliths 16 feet high. The great “*aula*” and the chapel entered from it are duly noticed; as is the (at that period probably rare) luxury of a fireplace with sculptured mantelpiece in each chamber; also the imposing effect, from a distance, of twenty-three lofty chimneys, like pinnacles crowning the stately edifice. The *pretorio*, or civic palazzo, is next visited and described, with its high belfry-tower and suitable residence for magistrates. Already had three cardinals and certain prelates from Rome followed the example of the Pope by founding stately palaces in the new city; and the chief piazza (here dignified by the name of Forum) was flanked and surrounded by imposing structures. An interesting anecdote is given about the architect, Rossellini, who had been calumniated and accused of betraying the confidence of his employer by unauthorized expenditure. The Pope summoned him; he came trembling and fearful; was encouraged, praised, declared to deserve rank among the first artists of his time, and rewarded on the spot with 100 gold florins, besides a scarlet mantle bestowed by the Pontiff's hand. His Holiness inserts in his

pages the edict issued by him before he left the city, that none, under spiritual penalties, should in any manner alter the buildings or adornments of the cathedral, paint its walls or columns, or add to the number of its chapels and altars; also prohibiting interment of any except the bishops and clergy of this See within its beautiful *duomo*—“*si quis contrafecerit anathema esto.*”

I visited the now decayed, and by the tourist-world (I believe) almost forgotten, Pienza from Montepulciano, the nearest city approached, though not reached, by railway. A drive of between two and three hours through a cultivated and fertile hill-country, uplands and valleys fair to look on but little inhabited, brought me to the old walls of Pope Pius's birth-place, which stands, as do almost all Italian towns of not modern origin, on high ground, and is more imposing at a distance than when seen from a nearer point of view—its ruinous fortifications and towers being distinct and striking to the eye long before one enters its gates. A silent, lifeless, and most *triste* place is it at the present day; no sign of movement, intelligence, or industry, save what may be inferred from the presence of a caputular clergy, from a few paltry shops, a third-rate *locanda* beyond the walls, and a wretched *caffè*, which I entered in order to observe such an establishment, usually a test of social conditions in Italian towns, amidst such surroundings. One wonders how the pulse of life is kept beating amidst the mournfully manifest inertness of this place—the “*gloomy slumber of the stagnant soul*”—yet Pienza is still an episcopal See, and the residence for each alternate half-year of bishops who preside also over the united diocese of Chiusi. My first visit was, of course, to the *duomo*, which did not disappoint me even after reading the vivid eulogium on its architectural beauties by the tiara-crowned founder. The façade is graceful and rich; its details—light columns supporting rounded arches, classic pilasters, and niches with triangular pediments, the adjoining octagonal campanile crowned with a low spire—present an harmonious *ensemble*; the Renaissance characteristics here assimilated to, not overcharging or masking, those proper to a temple for Christian worship. The interior also has a solemnity, inspiring something (if not all) of that devout emotion attributed to its architectural effect by Pope Pius. The deep blue, star-studded vaulting, and the Sienese paintings, on gilt *fondo*, over the altars,* still remain as described in the *Commentaries*. The church stands on a steep ridge, and not long ago was much injured in the rear part of its buildings by a landslip. Near it is the piazza—the only one in this dull little city—in the present aspect of which it is difficult to recognise the original, as described with laudatory language in the *Commentaries*—now indeed only different from such “*piazze*” in other small provincial towns of Italy in not being mediæval, but rather modern, though prematurely decayed; and also in the one feature, still imposing, of the bell-tower above the municipal palace, a building which, one perceives, has once seen better days.

I next visited the Piccolomini palace, now dilapidated, shut up, and to all appearance uninhabited, if not indeed uninhabitable, though still owned by that aristocratic family, and, as I was told, kept up for their use. The grace of its pillared porticoes round the quadrangular court, the well-defined cornices and pilasters of its three storeys,—Doric, Ionic, Corinthian,—and the mulioned windows of two lights with the simplest tracery in their rounded arches, the massiveness of the

* No one could give me any information as to these pictures, which are altar-pieces of the smaller size, evidently by superior artists, and of the devotional Sienese school contemporaneous with the pontificate here in question. The church contains two minor altars, besides those particularly described in the *Commentarii* (lix.). A competent cicerone at Pienza is not to be expected.

well-cut stonework and the deep warm tint given by time to the whole travertine structure, produce such an impression that one is inclined to class this with the finest specimens of the Italian palatial style in the fifteenth and sixteenth centuries—with the works of Bramante and Antonio Sangallo. But the desolated condition, the forlorn neglect to which this Piccolomini palace is now abandoned, wofully mar the pleasure such architectural character might otherwise excite. A sad reality is here before us, which attests the deplorable disregard on the part of present authorities for the less conspicuous monuments of a land the most abundantly enriched by the genius of past ages; and also (conveying a still deeper lesson from history) the rapid decline of the Roman pontificate from the spirit, purposes, and aims which animated the truly estimable and high-minded Pope Pius II.

C. I. HEMANS.

THE BRUNSWICK ONYX VASE.

DR. FIEDLER, of Wesel, recently addressed a letter to the *Allgemeine Zeitung*, in which he gives an interesting account of the Brunswick onyx vase, whose numerous hair-breadth escapes from capture and destruction might supply materials capable of adaptation for many a thrilling tale of startling vicissitudes, adventurous wanderings, and critical turns of fate. What had been the destiny of this nonpareil before the seventeenth century, where it saw the light, and who fashioned it in all its incomparable beauty, are questions which have hitherto baffled enquiry. All we know is that when, in the year 1630, the city of Mantua was captured, after many months' siege, by the imperialists, Duke Francis Albert of Saxe-Lauenburg, who commanded an Austrian contingent, noticed this now far-famed vase in the hands of one of his soldiers, and purchased it for 100 ducats from the man, who valued it only for the gold of which its foot and handle were formed. The soldier, when questioned about it, related that during the three days' plunder to which the city had been subjected, he and a companion had made a raid on some of the apartments of the royal palace, and observing the gold on the vase, he had snatched it up, and carried it away as part of his share of the booty. This palace had been the favourite residence of Vincenzo II., Duke of Mantua, and head of the great art-loving family of the Gonzagas, whose death without direct heirs in 1627 had drawn upon the unhappy Mantuans the war which laid waste their fair city, and which originated in the claims advanced by the Emperor Ferdinand II. on the duchy, in right of his empress the sister of Vincenzo. From the possession of Francis Albert of Saxe-Lauenburg, who was a connoisseur in art, and recognised in his newly-acquired treasure a genuine antique, it passed to his widow, who left it by will to her sister, the Princess Sophia Elizabeth, wife of August, reigning Duke of Brunswick-Lüneburg.

By this lady it was bequeathed as an inalienable heirloom to her son, Duke Ferdinand Albert, the Marvellous, whose zeal in collecting rare and costly works of art made him a fitting recipient for such a trust. By his directions a green satin case, bound with silver cords, was made for the vase, which was further secured from risk of injury by being enclosed in a padlocked and strongly-made wooden case, covered with silk and gold and silver lace. What is of more interest to us, he also caused the learned secretary, Eggeling of Bremen, to write an explanatory treatise in Latin on the goblet, and its mode of decoration. From this composition, entitled *Mysteria Ceres et Bacchi in vasculo ex uno onyche, &c.* (Bremæ, 1682, quarto), we learn that the vase is fashioned out of a genuine and precious gem, known as onyx, or sardonyx, and provided with a pure and massive wrought gold cover, spout, handle, and foot. Independently of these metallic additions,

the vase measures about 5½ inches in length, and about three inches in breadth. The ingenious workman who prepared the gem for its present adaptation has secured strength and cohesion for the entire mass by passing two hoops of gold around it in connexion with the handle and spout, and has thus divided the surface into three compartments, in the central one of which the artist has drawn twelve figures, which are cut into the stone in bas relief, and represent a sacrificial or other ceremonial connected with some religious mysteries. The upper division is decorated with appropriate emblems of fruits, leaves, heads of bulls, &c., while the lowermost compartment exhibits goblets, fruit-baskets, torches, serpents, and two human heads.

Eggeling's learned treatise was met by a counterblast of rhetoric from Dr. Feller, Professor of Poetry at Leipzig, and librarian to the University, who declared that the figures referred to the Eleusinian mysteries, and were not Bacchanalian in character, as the secretary had asserted. Soon a paper war disturbed the atmosphere of German academic literature, which reached its height in an angry retort by Eggeling, entitled *Absterio Fellerianarum Culumniarum atque acerbiſſimarum Injuriarum* (Bremæ, 1689); but which left the question of the real significance of the bas-reliefs undecided.

The monetary value of the treasure seemed to have been nearly as difficult of determination as the subject of its decorations, and in the inventories of the ducal *pretiosa* it fluctuated between 60,000 and 160,000 Reichs-thaler. In the beginning of the eighteenth century an attempt was made by the then possessors (the widow of Duke Ferdinand Albert and her sons) to find a purchaser for the vase, in order to give the Princess Sophia Eleonora of Brunswick the sixth part of the purchase-money in part payment of her dowry, in accordance with her father's intentions; but no one presented himself as a competitor for the prize, and the onyx cup, after a prolonged public but carefully guarded exhibition, was restored to its own iron chest, which was only to be unlocked in the presence of a high Court official.

In 1766, after having been the joint property of the Brunswick and Bevern branches of the family, it became the sole possession of the reigning ducal line, and thenceforth it followed the chequered fortunes of those princes. After the battle of Jena, in 1806, in which Duke Charles William of Brunswick was mortally wounded, the onyx vase passed with the fugitive family from Lübeck to Sweden, next from Als to Slesvig, and was at length deposited at Glücksburg, whence, however, from fear of Danish interference and in imminent peril of being seized by the French, it was conveyed to England by Colonel Von Nordenfels, whose perils by sea from privateers, and dangers by land from hostile armies, would fill a volume. Napoleon was at that very time turning a longing eye on the Mantuan onyx, and in return for its possession he is said to have offered to remit half a million francs of the war indemnity in which poor Brunswick was mulcted, but in vain; the family clung with hereditary tenacity to their precious treasure, and refused to listen to the tempter. On December 23, 1810, Colonel Nordenfels, attended by a faithful servant, left Glücksburg, and after passing through Prussia and Sweden to disarm suspicion, assuming disguises of every kind, and having to endure detention, delays, and interrogations at every turn, he reached London on April 16, 1811, and had the satisfaction, on the same day, of consigning his precious charge to the hands of the widowed Duchess Augusta of Brunswick.

Like many other fugitives of note, the Mantuan onyx remained in London till 1814, when it returned to Brunswick with the long exiled princes of the duchy. For a time it seemed as if nothing more could now threaten the peaceful rest of the wanderer; but in 1830, when the reigning Duke Charles heard his people clamour-

ing for his downfall, and saw his palace in flames, he bethought him of his Mantuan treasure before he sought safety in flight, and having sent a confidential friend to remove it from the ducal museum, he carried it away with him. Thenceforth nothing was known of it. No one ever saw it during the lifetime of the eccentric Diamond Duke; and when the city of Geneva, in conformity with his testamentary wishes, claimed as his universal residuary legatee all his works of art, a fruitless search was made for the long vanished onyx vase. At length, after oft-repeated examination of the ducal treasures, it was noticed that a shred of flannel protruded from the base of a metallic vase which appeared to be of very little value. On a closer inspection this vase was found to be split lengthways, and to be excessively heavy when compared with another vase of identical form and external appearance with which it seemed to form a pair. On separating the split surfaces the onyx came to view perfectly intact and uninjured, and thus the mystery of its supposed disappearance was at once explained. Genevan art-lovers were overjoyed at the discovery, but their hopes of calling the peerless beauty their own were shattered by the claim set up by the reigning Duke of Brunswick for the Mantuan onyx as an inalienable heirloom of his family; and now, after a second separation of thirty-four years, the gem is restored to the ducal museum of Brunswick. Since its unexpected resuscitation, various drawings and photographs have appeared of it in Germany, and among these the best is a water-colour sketch by Professor A. Gnauth, which gives a very correct representation of the figures with which it is decorated.

NOTES AND NEWS.

A RECENT sale at Christie's of a few examples of Sir Joshua, coming pretty directly from the family, will be within the recollection of our readers. Among the pictures was one of the Angel's Heads, like that in the National Gallery—the five heads being, as is known, five portraits, in different positions, of the child Frances Gordon, Lord William Gordon's daughter. The work, now carefully but sparingly cleaned, appears to reveal itself as a very exquisite example of the master; and with regard to it, Mrs. Noseda, its purchaser, has made an interesting discovery—to wit, that the earlier engraving of the angelic heads (that by Peter Simon), is in truth made from the picture now in her possession, and not from that in the National Gallery, as has hitherto of course always been supposed.

RETURNS have lately been printed "of the aggregate cost to the nation of the South Kensington Museum, including administration, buildings, maintenance, objects for exhibition in London and loan collections for country circulation, from the commencement of the Museum to the end of the financial year 1873-4:

"Of the cost of all purchases, classified according to the nature of the objects;

"And, of the cost of the loan or circulating collection, and of the objects which are retained permanently for exhibition at South Kensington."

The following are among the most noticeable items:—

1. Total cost to the nation of the Museum, including administration, &c., &c., building, objects, &c., to March 31, 1874, 1,191,700*l.* 17*s.* 4*d.*

2. Cost of purchases: sculpture, marble, stone, terra-cotta, original casts in wax, stucco, &c., 19,857*l.* 0*s.* 11*d.*; carvings in ivory, bone, horn, 18,435*l.* 8*s.* 6*d.*; woodwork (carvings, furniture, frames, marquetry, lacquer, &c.), 24,659*l.* 11*s.* 4*d.*; metal work (iron, steel, copper, lead, bronze, &c.), 17,806*l.* 12*s.* 11*d.*; coins, medals, medallions, and embossed plaques, 1,907*l.* 17*s.* 11*d.*; arms and armour, 3,025*l.* 15*s.* 4*d.*; silversmith's work (with ecclesiastical work, not enamelled), 13,374*l.* 5*s.* 3*d.*; jewellery and goldsmith's work (personal ornaments, gems, carvings in crystal, shell, amber,

coral, &c.), 15,995*l.* 10*s.* 6*d.*; enamels on metal, 17,017*l.* 5*s.* 2*d.*; earthenware and stoneware, 22,796*l.* 18*s.* 11*d.*; porcelain, 6,898*l.* 3*s.* 11*d.*; glass vessels, &c., 4,990*l.* 2*s.* 8*d.*; textiles, including embroidery, 6,603*l.* 9*s.* 8*d.*; musical instruments, 3,802*l.* 15*s.*; paintings in oil, copies of ornament in tempera, &c., 4,709*l.* 0*s.* 7*d.*; water-colour and other drawings, miniatures, illuminations, &c., 4,806*l.* 18*s.* 3*d.*; Meymar collection of Arabian art, &c., 2,261*l.*; other items raise the purchases to a total of 194,799*l.* 18*s.* 2*d.* Reproductions: plaster casts, electrotypes, fictile ivories, 30,220*l.* 18*s.* 1*d.*; art library, 38,642*l.* 0*s.* 11*d.*

THE new part of the *Revue Archéologique* (July) opens with a short article by M. François Lenormant on a series of engraved gems acquired in the early part of the present year by the British Museum. These gems were collected among the Greek islands, and are chiefly remarkable for the manner in which they correspond with the early Greek painted vases, both in style and in choice of subject. On the latter point it is to be observed that, except perhaps in two specimens in the Museum collection, the subject invariably consists of a quadruped, a Cretan goat, a bull, a deer, or a lion. Birds, which are not uncommon on the early vases, are here rare. Of the two specimens just mentioned as exceptions, the one (engraved *Rev. Arch.* pl. xii. fig. 1) represents Herakles fighting with the sea-god Nereus as on the archaic sculptured architrave of the temple at Assos in the Troad, now in the Louvre. The other represents the vulture gnawing the liver of Prometheus. In regard to style, the first thing that strikes one is the persistency with which the engravers have occupied the entire available surface of the gems, not scrupling to twist and distort the heads and legs of the animals even to the extent of making them barely recognisable sometimes, provided no blank surface were left. Without taking so much liberty with the figures, the early vase painters also appear to have diligently covered the whole ground of the vase, with pattern if not with figures. When the figure of a quadruped was to be painted on the neck of a vase in which the neck was peculiarly long, there seemed to be no resource for the early painter but to produce the legs of the animal as far as was required.

THE Royal Numismatic Society of Belgium held its annual general meeting at Brussels on July 5. A great number of members were present. Mr. C. Roach Smith, of London, and the Marchese Carlo Strozzi, of Florence, were elected honorary members. The Vice-president, M. Chalon, reported the success of the *Revue Belge de Numismatique* to have been greater than that of almost any foreign periodical of the same kind. M. de Schodt read a long and interesting historic, archaeological, and numismatic notice upon the ancient cathedral of St. Lambert at Liège.

IN consequence of the report of the Commission of the Fine Arts, the picture of Rubens, representing the Assumption of the Virgin, has been taken down from the high altar of Notre-Dame, at Antwerp, to be subjected to a close examination of its state of preservation.

MESSRS. BRAQUENIÉ, BROTHERS, manufacturers of tapestry at Aubusson and Malines, whose fine works may be remembered in the Paris Exhibition of 1867, are now exhibiting gratuitously at Malines an important series of Flemish and French tapestries from the fifteenth to the eighteenth century, containing specimens after the designs of Rubens, Lebrun, Oudry, Van Orley, Van der Meulen, Lucas of Leyden, &c., in which are fully displayed the beauty in design, colouring, and workmanship of this ancient industry of Flanders, Brussels and France.

THE French Government have determined to raise a monument in Switzerland, not far from the French frontier, to commemorate the fraternal conduct of the Swiss towards the French army

during the late war. The design for this monument consists of a pedestal in red granite, mounted on a base of granite four mètres in height. Round the frieze of the pedestal are twenty-two escutcheons, on which are represented the arms of the twenty-two Swiss cantons. On the front side of the pedestal the words are engraved:

"1870-1871.

A la République helvétique
La République française reconnaissante,"

while to the right and left are two groups in bronze representing, the one "The Arrival," in which a French soldier, worn out with cold, hunger, and fatigue, falls fainting into the arms of a compassionate Swiss peasant and peasant woman; and the other "The Departure," wherein we see the same soldier, restored by kindness, bidding a grateful farewell to his generous hosts. The principal group on the top of the pedestal is to be of marble, and has for its subject "Exhausted France confiding her children to Switzerland."

THE Corot testimonial fund has a long list of subscribers; indeed, the popularity of Corot in Paris at the present time seems unbounded, and is increased no doubt by what is considered the injustice of the Salon awards. The project of a gold crown of laurel leaves and a bust that was at first contemplated has been given up, and at a meeting of the Corot committee a short time since, it was decided that the testimonial should take the form of a medal, or rather medallion, in the style of the Renaissance. The execution of this work has been entrusted to M. Geoffroy Dechaume, a distinguished sculptor, and one of M. Corot's oldest friends.

THE Italian Government have recently given a warning to the German Archaeological Society in Rome that may perhaps restrain other societies, as well as private archaeologists and tourists, from infringement of a law which has hitherto been somewhat disregarded, but which it seems it is now determined to put in force under severe penalties. The law relates to the abstraction of works of art and antiquity from Italian soil, and the Italian Minister has just reminded the German Ambassador that the edict of Cardinal Pacca of April 7, 1820, forbidding the removal of such works except under proper authorisation, is still in full force and will be rigorously insisted upon. The Italian Minister especially desires that the directors of German museums shall be informed of this, and calls attention to the commission formed under the Papacy to regulate such matters, which is still in power. In cases in which the Government does not wish to buy the objects of art submitted to its inspection, extradition may be authorised by the Sovereign on the payment of a certain fixed duty. All antique sculptures, mosaics, blocks of antique marble, and pictures of the old schools are subject to this tax, and can only be bought by foreigners to be taken out of Italy under these prescribed conditions.

AN important step has been recently made towards the more perfect elucidation of the topographical and archaeological history of ancient Rome by the complete uncovering of the Forum, the true dimensions and exact site of which have hitherto remained a matter of discussion. At the close of last month the excavations of the Colosseum and the Forum were resumed with great energy, under the direction of Signor Rosa, whose well-directed and unremitting efforts have been rewarded by important results, which have definitely determined the limits of the Forum of ancient Rome. In 1848 the first real advance to this discovery was made by Canina's detection of the site of the Basilica Julia, which stretched its entire length on the southern extremity of the Forum, from which it was separated by only a narrow road. After a temporary resumption of the works in 1852, nothing more was attempted in this direction till 1870 and 1871, when the true pavement of the Forum, with its many-sided

large stones, was laid bare, and followed eastward towards the left, till it was found to be intersected by four lines of similarly paved roads. The south side of the enclosure was then clearly defined with its seven pediments, on which an equal number of votive statues had stood. One enormous columnar shaft was found shattered and split beside its base, both alike covered with the accumulated débris of ages. In 1872 the question of the extent of the Forum was decisively settled by the discovery of a transverse road, paved like the others, which formed a right angle with the front of the temple of the Dioscuri, and thus proved that the Forum did not extend towards the arch of Titus, as older topographers had assumed. At this point the workmen came upon the bas-reliefs which commemorate Trajan's erection of schools and asylums for orphan and outcast children in Rome and other parts of Italy, and his remission of all arrears of certain taxes. Although these tablets, which have been replaced on their original site, are unfortunately much injured, enough has escaped mutilation to show the beauty and harmony of the design. Near these bas-reliefs the eastern boundary of the Forum has been traced by the travertine stones of the pavement and the line of pediments which skirted it. Among these is a columnar base, inscribed in still legible characters, and proclaiming its dedication by the prefects L. Valerius and Septimius Bassus to the three emperors, Gratian, Valentinian and Theodosius, and belonging, therefore, to the period between 379 and 383 A.D. An enormous mass of broken architectural fragments has been brought to light in the process of clearing out this sacred spot, but few perfect remains have been recovered, which perhaps can scarcely be wondered at when we bear in mind that at one extremity of the Forum the superincumbent mass of débris had risen to a height of more than 24 feet. Yet, in the year 1527, not three and a half centuries from our own times, the German and allied troops of the Emperor Charles V. were able with small labour to clear the Via Sacra from the Arch of Titus to the Forum, for the triumphal passage of the conqueror of Rome.

A MOVEMENT, which is not the less strong because hitherto it has been rather of a covert than of an open nature, is going on in Germany, the object of which is to effect the centralisation of German art in the capital of German Imperial power. Berlin, say the instigators of this movement, is the only fitting place for the exhibition and gathering together of the art treasures of Germany, since within its precincts are centred the political power and life of the German Empire. In conformity with this craving for central unification, Munich is threatened with the loss of all that Cornelius and Kaulbach achieved for her, and the Bavarian Chambers, indifferent to the reputation of her art-schools, are on political grounds withholding the funds necessary for the erection of the contemplated schools of design at Munich.

A CORRESPONDENT of the *Augsburger Zeitung* writes from Athens, on June 25, that the Turkish Government has taken possession of Dr. Schliemann's house at Athens, and not being able to find the so-called "treasure of Priam" has laid an embargo on everything it could find, including the Metope with the Helios, and a bedstead valued at 5,000 francs. Dr. Schliemann still hopes to get the decision of the Areopagus, by which the antiquities found at Hissarlik were declared to be the property of the Turkish Government, rescinded.

DR. W. LÜCKE has written to the *Allgemeine Zeitung*, drawing attention to the various plans which are at present under consideration for the restoration of the Cathedral of Mayence, and calling upon the German public to interpose before it is yet too late to save that noble specimen of national Romanic art. The Cathedral of Mayence is worthy of special notice as being the prototype in Ger-

many of churches with double choirs, and a corresponding style of architecture in the towers and cupolas. In consequence of the dangerous condition of the eastern tower of the chancel of the Mayence Cathedral, its immediate restoration is urgently called for, while the connexion between the great central octagonal tower, with its cupola, and with the foundations of the towers on either side of it, renders it probable that the entire triple group of towers will require to be rebuilt in order to secure safety, as well as unity of design in the whole. The plan which has hitherto met with most approval from the Committee with whom the question rests, is one that aims at the restoration of the low broad and squat forms of the eleventh century; and it is this which Dr. Lübke appeals against with all the weight of his authority as a barbarous affectation, the result of which would be to produce a piece of work more slavishly mediæval than the Middle Ages themselves. He condemns *in toto* the uniform and undecorated pyramidal roof which was contemplated for the new east tower, and strongly advocates the adoption of the plan given in by Herr Wessicken, of Mayence, in which the higher elevations, more ornate decorations, and richer detailed ornamentation of the twelfth century, as exemplified in some of the noblest specimens of German ecclesiastical architecture, are made the ground-work of the design.

THE *Times* states that the Committee of the Dresden Gallery have just purchased of Mr. Cox, of Pall Mall, the splendid Sebastiano del Piombo, *Christ bearing his Cross*, from Prince Napoleon's collection, and also a work by Johannes Fyt and a Rubens.

THE STAGE.

SOME ACTING AT THE QUEEN'S AND AT THE GAIETY.

IF Mr. Boucicault's adaptation of M. Feuillet's drama, *La Tentation*, were only a little shorter, and if the first act were more interesting and more pregnant, and the duel scene less sensational—and if the programme ceased to be ornamented with a running commentary on the action of the piece, containing such alarming phrases as "the forlorn wife," "the self-tormentor," "the serpent on the hearth,"—it would perhaps be more generally recognised not only that the play affords opportunities for good acting, but that some of these opportunities are taken. For the piece, despite its six tableaux, its elaborate decoration with stamped leather hangings and Persian rugs, and its alarming finger-posts of phrases in the programme, is an ambitious and serious one: full of passages which delicate acting of minor characters could make effective, but doesn't; and containing several very dramatic situations which those who act the chief characters represent with some force, if with but little subtlety.

And yet the subtlety itself is not wholly wanting. For Mr. Charles Thorne, the new American actor, undoubtedly has it, and his part is the principal part in the piece. And sometimes, where there is not actual subtlety, as in the performance by Mr. Belford of the false Major, and in that by Miss Amy Roselle of the ingenuous yet ready-witted daughter, there is all the necessary intelligence, and that even which is better than subtlety in the wrong place—a subordination of personal display to the true requirements of the character. Mr. Belford's performance is on a good level, never broken from beginning to end. Miss Amy Roselle's is one of the brightest and best-considered bits of comedy-acting now to be seen in London. In its truth, its freshness, and its finish, it is worthy of the Paris Vaudeville and Gymnase.

Mr. Charles Thorne's performance, though weighted with two or three faults which have already been sufficiently indicated, is remarkable for its general conception of a character disappointed and tired rather than bitter; and for its habitual

expression of emotion in reticence, and for its occasional expression of emotion in strength of voice, look, and gesture. Mr. Thorne should specially be watched at the moment in the second act—a moment finely contrived—when Rodolphe, while seemingly addressing a caution in jest to his wife and Hector, is actually addressing it in very earnestness to his wife and the foolish poet, De Lesparre. His burdened aspect throughout the piece is excellent. At one time sadness makes of him the "want-wit" that it made of Antonio: at another it leaves him master of his means, and he is seeking, and adroitly finding, means of quarrel with the poet who would wrong him. Nor is the poet's part played badly by Mr. Edmund Leathes, though in truth it is a bad part. If he is stilted in the declaration of love over the chimney-piece—if this comes from him, as it does come from him, too readily, and too much as if it were the well-learned utterance of some imaginary character in the poet's own invaluable works—Mr. Leathes delivers his few words of greeting to Hector when he meets him unexpectedly, at an awkward moment ("Returned from Paris? You enjoyed your trip, I hope. You're looking very well"), with the utmost naturalness and effectiveness. Nor does Miss Barry fail, in the great part, in the expression of remorse and pain. Her performance lacks, not intelligence, but finish and suggestiveness. And it is in finish and suggestiveness that several of the representatives of minor characters are so much wanting. To be real, one must be individual; and, save in the one or two notable exceptions already instanced, individuality is missing—adequate characterisation by no means to be found.

There has been one uniformly artistic performance within the last week. *Nos Intimes* was performed at the Queen's Theatre on Friday and Saturday, in far better fashion than it has ever before been performed in London. That is not so as regards one or two principal characters. Marécot, for instance, was never better played than by M. Ravel two or three years ago at the Saint James's; but if a swallow cannot make a summer, clever little M. Ravel cannot make a company. And M^{me}. Fargueil has in each case been the heroine. And M. Parade has each time been the heroine's husband—the stolid person whose affection is only demonstrative when its objects are inanimate. He loves his garden as a Dutchman loves tulips—he admires his wife, and is tender to his cactus.

M^{lle}. Massin, it is true, is not seen to very special advantage as Benjaminine—daughter of the husband and wife, who are represented by Parade and M^{me}. Fargueil. Her part in *L'Oncle Sam*—poor as that piece is—has in it something more of that which is dramatic. Benjaminine is a naïve creature: the typical French *ingénue*; and M^{lle}. Massin can represent that character prettily enough; but so she could have done four or five years ago: it hardly gives her scope for the exercise of her present powers, which, though not great, are genuine. Tholosan, the doctor, was played by M. Goudry. His mission in the piece resembles that of Hector in Mr. Boucicault's *Led Astray*, from the French of M. Feuillet; but Tholosan is a cleverer and more important man than Hector. He is readier with his tongue, if not readier with his acts. He is a man of infinite resource, of endless devices—he will pull you through a difficulty with absolute ease, and if Benjaminine is the typical *ingénue*, Tholosan is the typical doctor-friend of modern French comedy and romance. But though he is a type, he is a type in new array. M. Sardou's wit and fancy have furnished him with sayings which it is pleasant to hear. The guests who give the piece its name—*Nos Intimes*, our intimates, our "tame-cats," if you will—are all excellent studies of character. Marécot, the guest who, with the best possible grace, does other guests the favour of taking the best seats and the best bedrooms, is only a little caricatured. Many a

country house could produce its guest who is quite willing to oblige by giving up one room, "pourvu qu'il y a une meilleure;" though in actual life the guest would hardly so naïvely say so. Then the poor man, to whom his rich friend gives everything in the world except success: the poor man for whom the world will never be right since it has treated some men better than himself—that also is a portrait but slightly caricatured. And then the friend who comes from afar, and takes up his quarters with supreme coolness—he, too, is a character not unknown altogether, though there is something farcical in the duration of his stay.

The piece would be full of interest and amusement—nay, we will add, of social instruction—even if M^{me}. Fargueil did not display in the part of the heroine her utmost art. As it is, it is something more than commonly interesting and amusing. M^{me}. Fargueil's dramatic power finds ample opportunity for its display; and great as she is in all great moments, she is intellectually almost greater in the quieter passages, for it is in these that she reveals the motive of the dramatic action—the motive, so to say, of the piece itself. Restlessness—which comes of a sense of something wanting: something by such a temperament never to be attained—is at the root of Cecile's adventures. And it is in showing this indeed that M^{me}. Fargueil makes a study of character. The stronger scenes are but a study of passion.

FREDERICK WEDMORE.

A WEEK ago it was the business of the critics to write of the performances of wearied artists before wearied audiences. Now there are hardly any audiences and hardly any performances to write about. The theatres have been fighting hard against the weather, but most of them have given up the contest. Some of the players have retreated in good order: others have been scattered ignominiously. The company at the Princess's has remained, we imagine, only to reap the proceeds of the benefit given for them on Wednesday at the Opéra Comique. Another benefit was to be given for them at the St. James's; but, at the moment of writing, this appears to be uncertain. M^{lle}. Agar—the travelling tragicactress—had had no difficulty in persuading M^{me}. Christine Nilsson to stay in town to sing for the Princess's company, at a performance at the St. James's; but M^{lle}. Agar's own success at the St. James's (never very brilliant) had perceptibly declined, and the theatre doors were shut several days ago. The Paris Vaudeville Company, only two days after changing its programme at the Queen's, departed altogether, and no announcement whatever was made of its departure; so that the persevering playgoer who went along Long Acre on Monday night, found no sign but that of iron gates closely fastened. Heavy M. Parade, witty Madame Fargueil, and pretty M^{lle}. Massin, had all gone away. Nor have French theatres been the only ones to suffer. The attractive qualities of *Brighton* and *Calypso* have not succeeded in crowding the Court. That playhouse will speedily close. At the Globe, this evening is the last of *Madame Angot*. Even *Giroflé-Girofla* will not hold its own very long at the Opéra Comique; and it is announced that at an early date of August the Prince of Wales's company will begin to take its usual vacation. So that most of the players retreat for the remainder of the summer, to rally again in the beginning of autumn. Meanwhile no place has been cooler and more suggestive of repose than the almost deserted playhouses. Box-keepers have dozed with impunity in the darkened corridors. Playgoers have spent their time chiefly at the refreshment bars. Actors have delivered their dialogue in great tranquillity: undisturbed, for the most part, by laughter or applause.

ALREADY there are signs of reopening. Drury Lane will receive its public before the end of August, when *Amy Robart* will be revived. And

at the end of September there will be produced Mr. Halliday's version of *The Talisman*, under the title, we believe, of *Richard, Cœur de Lion*.

THE Haymarket Company will go into the provinces, with its stock comedies, we understand, after August 3.

MR. IRVING has returned to town, and plays next Monday at the Standard.

MISS HODSON took her benefit at the Royalty Theatre at the end of last week. The event of the evening was the performance of Triplet (in *Masks and Faces*) by Mr. Benjamin Webster.

THE performance of *Polyeucte* at the Théâtre Français has been made the occasion, by M. Clément Caraguel, for a study of a work of Corneille whose interest is now purely literary. It is difficult, as the critic reminds us, to realise the time when it had something to say between the lines, to the audience that listened to it—just as more recent audiences, at the Théâtre de l'Odéon, have read something between the lines in the romantic dramas of Hugo. There was a time—the time of its first days—when *Polyeucte* was rarely performed, lest the French Protestants should be encouraged, by the glorification of martyrdom, to persist in their opposition to the Church. In 1688, as a passage in *Le Théâtre Français sous Louis Quatorze* points out, M^{me}. de Maintenon addressed a memoir to the King, advising him, "d'interdire les spectacles qui donnent une idée de martyre, rien n'étant plus dangereux pour les nouveaux catholiques et pour les anciens." As for the play of *Polyeucte*, Polyeucte himself doesn't touch us any more: he is too much above that human nature of which most of us, as the wit said, possess a good deal. Sévère and Félix are the two human characters in this play of Corneille's. Sévère is a very fine and liberal fellow. "J'approuve," he says:—

"J'approuve cependant que chacun ait ses dieux,
Qu'il les serve à sa mode et sans peur de la peine."
He is rather like Mr. Peter Bayne's Jezebel in this respect—Jezebel, the cultured woman, who, according to Mr. Bayne, was given only to persecute the Hebrews because these were exclusive and intolerant, and

"Tolerance of the intolerant,
Is sin against all toleration."

But the parallel, fortunately for Sévère, is not one that can be far pursued. Félix, like Sévère, is of our time and of all time: "Cet ambitieux sans cœur," says M. Caraguel with indignation: "sans pudeur, sans conscience." His daughter, Pauline, is played by M^{me}. Favart, while Polyeucte is played by M. Dupont-Vernon—almost a débutant. This is hardly the kind of thing to fill the Théâtre Français on a stifling night of July.

AND, *à propos* of this almost débutant, M. Dupont-Vernon, M. Francisque Sarcey has something to say. Dupont-Vernon was just called to the bar when he yielded to his passion for the stage. He took his lessons regularly. He appeared at the morning performances given by M. Ballande: high class classical and romantic performances which are very well attended. He had evidently intelligence and perseverance too, but his looks were terribly against him. He wished to be allowed to join the Comédie Française: the wish at that time was almost an impertinence. And an influential actress—member of the house of Molière—being present one day at one of these performances, in company with M. Francisque Sarcey, expressed astonishment that Dupont-Vernon could expect to gratify his wish. "He act tragedy! Mais regardez-moi ce nez!" And the wise M. Sarcey had the boldness to say to the actress that one day the Comédie Française would be glad to have him, notwithstanding his nose. And the day has arrived.

At the Palais Royal they have revived the *Diablos Roses*, and M^{me}. Schneider has returned to the theatre for this performance.

MUSIC.

CRYSTAL PALACE.

THE idea of devoting one of the present series of Summer Concerts at the Crystal Palace to an exposition of the quaint and humorous in music was an extremely happy one, and the selection given last Saturday was alike full of interest and novelty. The opening piece—Mozart's "Musical Joke"—was also to musicians unquestionably the most amusing. Written originally for a string quartett and two horns, it suffered, no doubt, from being played by a full orchestra, as the horn parts, which are in many places intentionally wrong, did not always come into due prominence. Still there was quite sufficient of the fun which could be appreciated by a mixed audience, though much of it is of a nature to escape the notice of any but musicians. The work is a joke written at the expense alike of incompetent players and bad composers. All could enjoy the fun that is made of the former, as, for example, in the first movement, where the horns come in with a great fanfare half a bar too soon; in the minuet, where the same instruments come to grief utterly in a little piece of duet allotted to them; or again in the cadenza for the violin solo at the end of the slow movement, where the player, having some very high notes, instead of showing his mastery of the instrument, gets most horribly out of tune—this cadenza, by the way, was given with admirably appreciative humour by Mr. T. Watson; his "feeling about" for his high notes being exceedingly comic; or the close, in which the instruments with a great crash leave off each in a different key. That the audience entered into all this was evident from the bursts of laughter which from time to time interrupted the performance. The jokes at the expense of bad composers, however, were less understood, except by the musicians present; though these are, in their way, quite as good as the others. The gross violations of the most fundamental rules of composition, the clumsiness of the modulations, the inane, quasi-idiotic "shiftlessness" of the thematic developments in the finale, are all "most admirable fooling," and the more so as the composer lets us see through the whole work that he is only laughing in his sleeve; and the piece never becomes either really foolish or dry.

Another of the chief items of the concert was Haydn's "Farewell" symphony, written, as it is said, as a hint to Prince Esterhazy when that nobleman was thinking of dismissing his private band. The joke of this work is contained in the last movement, in which all the instruments leave off by degrees, and each performer, having finished his part, takes up his instrument and walks out of the orchestra, till at last the conductor is left alone in his glory. The effect of this finale on Saturday was greatly heightened by the unintentionally comic appearance of some of the members of the band, who left the orchestra with an expression of countenance denoting that they considered it a great hardship, if not an actual indignity, to be asked to take part in this harmless practical joke. The other instrumental pieces in the selection were the well-known "Clown's Funeral March" from Mendelssohn's *Midsummer Night's Dream* music, Mr. Sullivan's capital "Grotesque Dance," from his music to the *Merchant of Venice*; and Rubinstein's Humoresque *Don Quixote*, a very clever work, of which, however, the humour is less generally appreciable than in the pieces above referred to. The vocal music included the song "Una voce poco fa," very well sung by M^{me}. Florence Lancia, but which seems hardly to come into the category of humorous music; the duet "Pronta io son," from *Don Pasquale* (M^{me}. Lancia and Signor Gustave Garcia), John Barnett's duet, "The Singing Lesson," sung by Signor and M^{me}. Garcia—of which we will only say that if the spoken dialogue introduced was in the original, the piece was altogether unworthy of a place in the programme, and that if it was merely

"gag" it was most discreditable to the singers who introduced it; and Donizetti's scena "Il Padre della Debutante," sung by Signor Garcia. Besides these pieces, the London Glee and Madrigal Union (Messrs. Coates, Land, Baxter, and Lawler) sang with admirable finish the old catches, "Would you know my Celia's charms," and "Ah! how Sophia," and Truhn's humorous part-song, "The three Chafers;" and finally the Crystal Palace Choir was heard in Handel's so-called Laughing Chorus, "Haste thee, Nymph," and in Hatton's comic part-song, "The Letter." In the solo part of the former piece Mr. George Fox did his laughing admirably, which is more than can be said for the chorus. Their "ha, ha, ha" and "ho, ho, ho" sounded at times as little like a laugh as can well be imagined.

EBENEZER PROUT.

THE MOZART FESTIVAL AT COVENT GARDEN.

WHEN in Vienna it is desired to honour the memory of a great composer or poet, they raise a fund, from which prizes are distributed after a certain period to worthy and promising students. So, when some three years ago Grillparzer, the poet, celebrated his jubilee, a large sum was raised by voluntary contributions, out of which every three years the author of the best dramatic work produced within that time is to receive a prize. To honour the memory of Wolfgang Amadeus Mozart, the son of the Salzburg Kapellmeister, the "Mozarteum" Society in Salzburg has proposed to found an Academy of Music, at which future musicians are to be educated for a merely nominal sum. This idea, originating in the head of Dr. Bach, the Director of the "Mozarteum," is certainly a good one, but whoever is to carry it out must take Lago's advice, and "put money in his purse." But money was just the thing the "Mozarteum" had not got; for when, two years ago, one of our Vienna friends visited Salzburg, the committee of the society offered to part with a very rare relic of Mozart that was in their possession, viz. the bill of the first night on which *Zauberflöte* was performed (at the Theater an der Wien, under the management of Schikaneder, Mozart's librettist). Our friend bought that bill, and left it to the "Mozarteum," upon condition that they should always retain it in their possession. Such was then the state of the society's means. But Dr. Bach's energy did not flag. He caused concerts to be given in several large Austrian cities in aid of his fund, and established a branch of the society in Vienna, of which Dr. Oskar Berggrün, one of the editors of the *Deutsche Zeitung*, and honorary treasurer to the Vienna Wagner-Verein, was made director. Through Dr. Berggrün's aid and influence new resources were opened to the society, and when in March last year M^{me}. Adelina Patti was in Vienna, he obtained a promise from her that she would give a concert in London for the benefit of the Fund. This concert was given on Thursday, July 16, at Covent Garden, with the personal assistance of the Marquise, together with her ordinary colleagues of the Royal Italian Opera. Of course, when Adelina Patti takes anything in hand, expectation is raised to the greatest height. On the present occasion it was completely fulfilled. The only mistake made, and this we do not attribute to M^{me}. Patti, was the extraordinary length of the programme, of which it was found necessary to omit several pieces. Space will not allow us to speak at length of all the performances; we must content ourselves with mentioning a few of the most striking items, and will first name a perfect rendering of Mozart's Symphony in E flat, played by the orchestra of the Royal Italian Opera, under Sir Julius Benedict's baton. We think, however, that the performance of an entire symphony in the middle of a programme consisting almost entirely of operatic selections, was a mistake. Of double interest to us was the execution of the G minor quartett (first and last movements) by Messrs. Carrodus (violin), A.

Burnett (viola), E. Howell (violoncello), and Mdlle. Marie Krebs (pianoforte). We had heard that best of lady representatives of the German pianoforte school many a time playing both with orchestra and solo pieces, but, as we were unable to attend at the only concert of Mr. Ella's "Union" at which she performed, we had never before had an opportunity of hearing Mdlle. Krebs in chamber-music. We are glad to state now, that we find her to be as accomplished an artiste for quartett playing as for any other kind of pianoforte music. The programme also announced Mdlle. Krebs to play with Mr. Carodus the variations from the sonata in F major; but the concert threatened to become so long that this was omitted, although we, for our part, would rather have dispensed with some of the abundant vocal solos instead. The orchestra also played the overture to *La Clemenza di Tito*, other selections from that opera being the duo "Ah perdona," finely rendered by Mdlle. d'Angeri and Mdlle. Calasch, and "Non più di fiori," most expressively delivered by the former lady. Mdlle. Albani joined Mdlle. Marimon in the duo "Sull' Aria," the former lady selecting the romanza "Dove sono" (both these pieces from *Nozze di Figaro*), and the latter the bravura aria "Gli angui d'inferno" (*Zauberflöte*) for their solos. Signor Bagagiolo sang the well-known "Qui sdegno;" Signor Ciampi gave "Madamina," and Signor Nicolini "Dalla sua pace," both from *Don Giovanni*. One of the finest bits of singing we ever heard was Mdlle. Vilda's delivery of the grand aria of *Il Seraglio*; but the best we must reserve for the last, "pour la bonne bouche;" the performances of M. Faure, the great French baritone, and Mdlle. Adelina Patti, to whom the Mozart Academy is so greatly indebted. M. Faure sang the charming serenade "Deh vieni," from *Don Giovanni* (in place of Signor Cotogni, who was ill), the spirited aria "Non più andrai" (from *Nozze di Figaro*), and joined Mdlle. la Marquise in the ever fresh and delightful duo "La ci darem la mano," their singing of which cannot be equalled by any other two living artistes. For her solo Mdlle. Patti sang, in her own inimitable style, the aria "Batti Batti" of *Don Giovanni*, and being encored, favoured us with another air out of the same opera. A grand close was given to this remarkable concert by the performance of the finale of the last-named opera, in which all the staff of the Royal Italian Opera, orchestra, chorus, and soloists, took part, and we left the house with feelings of gratitude towards those who had not only enabled us to spend a most enjoyable evening, but also done a great service to Art by lending their valuable aid for the Mozart Academy in Salzburg. We must not forget to mention that Signori Bevigiani and Vianesi assisted Sir Julius Benedict in conducting, and that Mr. Gye, in spite of a severe domestic affliction, took an active part in the execution of the arrangements. Also we have to thank the patrons of the concert, at the head of which stood Count Beust, the Austrian ambassador. Owing to the omissions already referred to, and several others made in the course of the proceedings, the concert, which had begun on Thursday evening at nine o'clock, came to its close at a rather early hour on Friday morning. SIGMUND MENCKES.

THE operatic concert given at the Crystal Palace on Monday last by the members of Mr. Gye's company requires no more than a word of mention. The great attraction was, of course, Mdlle. Patti, who sang the "Shadow Air" from *Deronah*, and the well-worn "Ernani involami." Mdlles. Marimon and Albani, Mdlle. Vilda, and Signors Marini, Pavani, Cotogni, and Bagagiolo also took part in the concert.

We are glad to be able to announce that there is once more some definite prospect of the production of *Lohengrin* in London. We learn on good authority that, thanks to Mdlle. Vilda, who is

considered in Vienna the best exponent of the part of Elsa, Mr. Gye has promised to bring it forward next year. Signor Nicolini is to be Lohengrin, and Mdlle. d'Angeri Ortrud. Signor Vianesi has undertaken to direct the performances, and we earnestly trust that nothing will occur to prevent Mr. Gye from carrying out his intentions, and thus earning the hearty gratitude of all amateurs and connoisseurs in this country.

We are informed that Mr. Arthur Chappell has engaged Mdlle. Marie Krebs for the next season of the Monday Popular Concerts.

A MUSICAL festival is to be held at Plymouth on the 14th and 15th proximo, in connexion with the opening of the new Guildhall in that town by H.R.H. the Prince of Wales. The music, which will be conducted by Mr. F. N. Lühr, will consist of the oratorios of *Elijah* and the *Creation*, and of a miscellaneous concert.

DR. W. H. STONE has lately written a letter to our contemporary the *Musical Standard* on the subject of the so-called "French pitch" adopted (or said to be adopted) at the operas. From careful observations made with tuning-forks, he has found that at neither house is this pitch, or anything approaching to it, in actual use. Covent Garden, which is rather the lower of the two, is a full quarter-tone above the French diapason, while Drury Lane is at ordinary English concert pitch.

A NEW opera, *L'Esclave*, by Edmond Membreé, which has lately been produced at the Paris Théâtre de l'Opéra, is reviewed at some length by M. Rey in the *Débats* of the 19th inst. The critic complains of the want of good musical situations in the work, which shows much talent, but (having been written twenty-five years since, though only now produced) is somewhat old-fashioned in style.

A THREE-DAYS' Musical Festival at Halle commences to-day. Among the chief works to be performed are: Berlioz's "Requiem," Brahms's "Rinaldo," Liszt's "Faust-Symphonie," A. Dietrich's violin concerto, and Raff's pianoforte concerto.

THE second trial of new compositions by the Musical Artists' Society took place on Wednesday evening at the Fine Arts Gallery, Conduit Street. This recently-established Society aims at the same object so long and so well carried out by the now defunct Society of British Musicians—namely, the encouragement of native talent by affording composers an opportunity of trying their new works. The Society has been in existence for so short a time that the present number of members is but small; but it is hoped, should the support be met with on the part of the public which is richly deserved, ultimately to give concerts not only of chamber music but also of orchestral works. For the present, however, the operations of the Society are limited to private trials, to which only members and those who receive special tickets of invitation are admitted. Such being the case, any detailed criticism of the works performed would be out of place, if not impertinent; it must suffice to mention that, in addition to various vocal pieces, pianoforte trios by Dr. Maclean (of Eton) and Mr. J. F. Barnett, a pianoforte duet by Mr. C. E. Stephens, and a piano solo sonata by Mr. H. F. Banister, were produced. Two string quartetts were also in the programme; but these were (happily for the audience) omitted. We hope the directors of the society will avoid the all but universal mistake of too long concerts. The present one, as it was, was almost too long; half an hour less would have been much better. We ought to add, in justice to our countrymen, that the average interest of the music was fully equal to that of a programme of either French or German novelties; and that it proved, what few who are competent to judge doubt, that English musicians are able fairly to hold their own against foreign competitors.

POSTSCRIPT.

THE *Temps* gives the following extract from a letter of Victor Hugo, in answer to an invitation to be present at the celebrations at Avignon:—

"Pétrarque est une lumière dans son temps, et c'est une belle chose qu'une lumière qui vient de l'amour. Il aime une femme et il charma le monde. Pétrarque est une sorte de Platon de la poésie; il a ce qu'on pourrait appeler la subtilité du cœur, et en même temps la profondeur de l'esprit; cet amant est un penseur, ce pète est un philosophe. Pétrarque, on somme, est une âme élatante.

"Pétrarque est un des rares exemples du poète heureux. Il fut compris de son vivant, privilège que n'eurent ni Homère, ni Eschyle, ni Shakespeare. Il n'a été ni calomnié, ni hué, ni lapidé. Pétrarque a eu sur cette terre toutes les splendeurs, le respect des papes, l'enthousiasme des peuples, les pluies de fleurs sur son passage dans les rues, le laurier d'or au front comme un empereur, le Capitole comme un dieu. Disons virilement la vérité, le malheur lui manqua. Je préfère à cette robe de pourpre le bâton d'Alighieri errant. Il manque à Pétrarque cet on ne sait quoi de tragique qui ajoute à la grandeur des poètes une cime noire, et qui a toujours marqué le plus haut sommet du génie. Il lui manque l'insulte, le deuil, l'affront, la persécution. Dans la gloire Pétrarque est dépassé par Dante, et le triomphe par l'exil."

THE *Osservatore Romano* announces the death of Father Secchi's friend and colleague at the Observatory, Father Paul Rosa, who at the time of his death was engaged on a still incomplete work on the diameter of the sun, in which he had endeavoured to prove that the circumference of the solar body varies in dimensions at different periods.

THE *Athenaeum* states that Herr Brugsch will attend the International Congress of Orientalists as the representative of the Khedive, and intends to deliver a lecture on the Exodus.

No. 117, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

LITERATURE.

THE UTRECHT PSALTER.

The Athanasian Creed in connexion with the Utrecht Psalter; being a Report to the Right Honourable Lord Romilly, Master of the Rolls, on a Manuscript in the University of Utrecht. By Sir Thomas Duffus Hardy, D.C.L., Deputy-Keeper of the Records.

The Utrecht Psalter: Reports addressed to the Trustees of the British Museum on the Age of the Manuscript. By E. A. Bond, E. M. Thompson, Rev. H. O. Coxe, Rev. S. S. Lewis, Sir M. Digby Wyatt, Professor Westwood, F. H. Dickinson, and Professor Swainson. With a Preface by A. Penrhyn Stanley, D.D., Dean of Westminster. With Three Facsimiles. (London and Edinburgh: Williams & Norgate, 1874.)

Further Report on the Utrecht Psalter; in answer to the Eight Reports made to the Trustees of the British Museum, and edited by the Dean of Westminster. By Sir Thomas Duffus Hardy, D.C.L., Deputy-Keeper of the Public Records.

PROBABLY the dispute about the date of the Utrecht Psalter is at an end, for lack of any more arguments that can be adduced in support of either of the two opinions that have been published on the subject. We call them two opinions, for, in fact, they resolve themselves, for practical purposes, into two—viz., that of Sir Thomas Hardy, who assigns it to the sixth century; and that of his opponents, who variously assign it to the seventh, eighth, ninth, and tenth centuries. Whatever different parties in the Church of England may think as to the issue of the struggle to maintain the Athanasian Creed intact in the position which it has held in the Prayer Book for more than three centuries, the struggle itself has resulted in bringing to light the long-lost Utrecht Psalter, and has brought out perhaps nearly all that can be said on both sides as to the question of its date. The real importance of that date is not so great as it would have been if the date of the composition of the Creed had depended upon it. Had there been no such internal evidence in the Creed itself to settle its date, it would of course have been of the highest interest and importance to be able to produce an undoubted copy of that Creed written in the sixth century. The value, therefore, of the discussion as to the date of the MS. is seriously detracted from when it is remembered that the illustration of the doctrine of the One Person in two natures in the words, "For as the reasonable soul and flesh is one man, so God and man is one Christ," proves that it must have preceded the Eutychian heresy condemned at Chalcedon in 451 A.D. Waterland has observed that up to that time this similitude

had been in common use from the time of the Apollinarian heresy, but would not have been used after the time of the Eutychian heresy on account of the apparent countenance it might give to the Monophysites. The argument is more convincing than this author's further plea for the Creed being earlier than the Council of Constantinople. But whatever force this latter argument may possess, we cannot but think that it is somewhat of a blot upon the otherwise admirable *Critical History of the Athanasian Creed*, that Waterland should have gone out of his way to suggest, without producing even a shadow of evidence for his opinion, that Hilary, Bishop of Arles, was its author.

We are not concerned now with the Creed, its doctrine, or its date, but only with the particular MS., which we believe to be the earliest existing transcript of it. And its history is sufficiently curious.

Amongst the *desiderata* of the magnificent library which once belonged to Sir Robert Cotton, and is now lodged in the British Museum, is a manuscript which has the press mark Claudius A. VII. It was there in the seventeenth century, when Archbishop Ussher, of Armagh, saw it and described it, assigning it, as any one would naturally have assigned it, to the sixth century, from the style of rusticated Roman character in which it is written throughout. This style did not last to any much later period, and though many MSS. have portions, such as headings and the like, written in it, yet no known MS. of later date than that century is wholly written in this character. When Waterland wrote his *Critical History of the Athanasian Creed*, he gave an account of all the MSS. of the Creed which he had seen or heard of, and especially notices the absence of this one from its proper place. How it had disappeared it is impossible now to conjecture. That it had not suffered from fire, as many of the other volumes of the collection had, was pretty plain, because none of the volumes which must have been adjacent to it had been damaged in this way. And there only remains the hypothesis of carelessness on the part of the keeper, or theft by the hands of some unknown fancier of such things. Without, however, attempting to account for the fact, we can only detail it—viz., that the Psalter is now in the library of the University of Utrecht, to which it was presented by a Monsieur D. de Ridder, in 1718, just five years before the first edition of the *Critical History of the Athanasian Creed* appeared, from the pen of Daniel Waterland, Archdeacon of Middlesex. The authorities of the University have kindly permitted its temporary removal to this country, where every page of it has been taken off by photography, so that now every one may see and judge for himself of the handwriting and the surface of the material on which it has been written, the thickness of the vellum being perhaps the only point which cannot be judged as well from the copy as from the original.

The Report which stands first of the three publications at the head of this article was written before the copy had been made, and Sir Thomas Hardy was under the additional disadvantage of not having seen the original.

All that he had seen was the photographed copy of the four pages of the Psalter which contain the *Nunc Dimittis*, the *Gloria in Excelsis*, the *Patet Noster*, the *Symbolum Apostolorum*, and the *Fides Catholica*, which now goes by the name of the Athanasian Creed. However, he still professes, now that he has seen the original, to be of the same opinion—that the Utrecht Psalter, with its drawings, which are perhaps nearly contemporaneous with the MS., is a production of the sixth century; that it is written throughout by the same hand, with the exception of the initial (B) of the first Psalm, and the headings of the Psalms, which, as well as the initial letters of each verse, are written in red uncials of a size somewhat larger than the text, and by a different hand. The mistakes in both of these indicate that the scribe was, at least, not a very accurate Latin scholar. The character of the handwriting is not denied to be that commonly used in the sixth century, and much resembles that of the celebrated MS. of Prudentius in the Imperial Library, as well as the almost effaced writing of the palimpsest from which Cardinal Angelo Mai produced his fragments of Cicero's Orations. When, however, Sir Thomas Hardy ventures to assert that the writing of the Prudentius and the Utrecht Psalter is so alike that they might have been produced by the same scribe, we are obliged to say we cannot go along with him; and we observe that in his second publication he has not repeated this opinion.

There can, we think, be no reasonable doubt that the handwriting is actually of the sixth century; or if not, that it is a copy of a later period, imitating the style of the sixth century—in pretty much the same way as if a book were printed in the nineteenth century in imitation of the black letter of the sixteenth. The question arises, which of these two interpretations is the more probable. Sir Thomas Hardy unhesitatingly adopts the former hypothesis. The writers of the brief notices which have been introduced into public favour under the wing of the Dean of Westminster, eight in number (or nine, if the Dean is to be included amongst them, and he has as good a title to the name of Palaeographer as some of them), assign various dates from the seventh to the eleventh century, some of them not being precise to a century or so; but the reasons they have given for their opinion are either none, or of the very slightest description, with the exception of Mr. Bond, Mr. Thompson, and Professor Westwood, who must be admitted to be authorities on the subject.

The opinion of the Bodleian Librarian, of course, is of great weight, but it is in this instance a mere opinion, unsupported by any argument. The opinions and arguments of Professor Westwood, and of Messrs. Bond and Thompson, are combated at great length, and very minutely examined in the *Further Report*, and it will therefore not be necessary to allude to the second of the works placed at the head of this article, any further than as it is noticed in the third. We shall dismiss it therefore with the single observation that the Dean of Westminster, in the two statements he has ventured to make as regards the drawings, has been guilty of two mistakes, such as no one, we should think,

who had paid the least attention to the text and the drawings could have made.

We were quite convinced by the Deputy-Keeper's First Report that the MS. was of the sixth century—but there were some difficulties still left to be solved. And first, as regards the initial (B) of the first Psalm. Opinions seemed to differ so widely that it seemed as if it would be necessary to have recourse to the argument that such letters were frequently put on at a much later date than that of the rest of the writing. Sir Thomas Hardy was of opinion that it was the work of an Irish artist of the sixth century, and his judgment was supported by eminent Irish authorities; but there did not appear to be much evidence producible either way, and we confess that we were not altogether satisfied about the matter. The letter itself was undoubtedly put on after the book had been bound up, for the mark of the letter shows through to the front, and even faintly on the back of the second leaf. Nevertheless, the space left for it indicates what the shape of the letter was intended to be, and it is highly satisfactory, therefore, to be able to fall back on the great probability which exists, that it was inserted soon after the rest of the text was written. Unquestionably the two facsimiles of the letter B, produced from a MS. of the sixth century, on p. 27 of this *Further Report*, are amply sufficient to show that the same letter in the Utrecht Psalter may be of that date also.

Sir Thomas Hardy plays off his opponents against each other, Mr. Bond describing the B as an Anglo-Frankish initial of the ninth century, whatever that epithet may mean; and Professor Westwood calling it Anglo-Saxon, of the seventh or eighth century at earliest, adding that the drawings may have been added in the ninth or tenth century. It is something, then, to get such an opinion from so good an authority that the drawings may very well have been added a century or two later, and that the only objection, therefore, to assigning the MS. to the sixth century, so far as the mere handwriting and shape of the letters is concerned, rests in the fact that one initial letter is supposed to be of the seventh or eighth century. If this were all admitted, and the argument about the B could be got rid of, Professor Westwood could assign the text to the fifth or sixth century. Now, that the B *may be* of the sixth century is completely proved by the production of two letters precisely resembling it, which are undoubtedly of that age; and we cannot but think, therefore, that the Deputy-Keeper and Professor Westwood have between them established the date of the Utrecht Psalter to be pretty clearly of the sixth century. We are not now concerned with the drawings. We are only arguing for the antiquity of the text, and we confess to a feeling of satisfaction that so easy and intelligible an argument for the antiquity of the Athanasian Creed is producible, inasmuch as it requires more knowledge of theology than any but professed theologians possess to appreciate the internal evidence from which Waterland professes to settle its date.

There remains, however, the possible hypothesis that the MS. is a literal copy,

whether for the purpose of a forgery or for some other unexplained end, of the rusticated character and tri-columnar arrangement which was common in the sixth century, somewhat after the fashion of some modern publications of the nineteenth century imitating the type and spelling of the sixteenth or seventeenth, with which of late years we have been familiar. And here Mr. Bond and Mr. Thompson both assert that the writing is of a weak and irregular character, like that of a scribe who is copying in a hand to which he is not accustomed; and Mr. Thompson even goes so far as to say that "an examination of the letters in detail will show, in the rustic letters, certain deviations from original forms which would not be found in genuine writing." Now this may of course be true, but Mr. Thompson has produced no evidence of this by comparison with other MSS. of the sixth century. In fact, it is scarcely possible to produce any, for writings of this century are so few that they may be counted on the fingers. It is not the fault of either of these gentlemen, but only their misfortune, that sixth century MSS. are not producible in support of their opinion, which may, nevertheless, by possibility be true; and the same observation applies to the remarks they have made on the quality of the vellum. On this point no one can form a reliable judgment unless he has seen the original. We do not profess to notice this argument further than by saying that Mr. Thompson's opinion is that the vellum has "none of the smooth crispness which one *looks for* in very ancient manuscripts;" that Mr. Bond attributes to it the character of being leathery, and wanting the fine surface of a very ancient manuscript; and that the Deputy-Keeper asserts that the vellum of the ninth century, to which these gentlemen refer the Psalter, is "as far as possible removed in surface, substance, and opaqueness from the vellum of the Utrecht MS." (p. 27).

And now we recur to the handwriting. There is, perhaps, on both sides a tendency to overstate the force of the arguments respectively used. But Mr. Bond has been guilty of a great exaggeration in stating the premiss of his argument when he says that "Instances can be produced of the use of rustic capitals even for the greater part of a MS. so late as the ninth or tenth century." Now it must be observed that, to make this argument complete, it is necessary that the *whole*, and not the greater part of several MSS. of the ninth or tenth century should be produced written in rustic capitals, whereas it appears that there is only one instance producible, viz., the treatise of Aratus on Astronomy in the Harleian Collection, No. 647. Moreover, there was here an evident reason why the handwriting was copied. Mr. Bond observes that "in order to keep up the likeness of the figures it was found convenient to preserve the forms of the letters in writing within them" (p. 28).

It may fairly, therefore, be asked, Is there any assignable reason for the Utrecht Psalter being written throughout, as it is, in characters which belong to the fifth and sixth centuries, if it was really transcribed in the ninth or tenth. No answer to that question is as yet forthcoming. Unless, therefore,

there is anything in the drawings to show that they could not be so early as the sixth century, and that being of a later century they were not added to the text at a considerable interval of time, it must be admitted that the immense amount of preponderating evidence is in favour of assigning at least the manuscript part of the Utrecht Psalter to the sixth century. Perhaps Sir Thomas Hardy has laid too much stress upon Archbishop Ussher's opinion, which it seems to us is not entitled to as much weight as that of palaeographers of the present day, who have been much more familiar with ancient MSS. than anyone in the seventeenth century could have been. The theory must rest, not on authorities but on arguments; and the question does not resolve itself into forming a judgment whether we will accept Sir Thomas Hardy's opinion, or adopt the conclusions of Professor Westwood and Messrs. Bond and Thompson—but simply into a fair estimate of the arguments adduced. And one point especially to be borne in mind is the paucity of MSS. of the earlier alleged date against which these latter gentlemen are enlisted. At the same time it must in fairness be admitted that the concurrent testimony of competent judges, although not supported, and perhaps not supportable, by any producible arguments, is entitled to some weight; and, above all, we should be unwilling to disparage that sense or feeling, or whatever else it is to be called, which enables an expert to decide as the Bodleian Librarian has decided, which is independent of the ordinary arguments which would influence the vulgar.

And now to return to evidence which can be appreciated by ordinary readers. The matter of punctuation is of some importance. At least, Mr. Bond and Mr. Thompson appear to think so, for they both decide on this point against the antiquity of the MS. There is a free use of the semicolon, both proper and inverted, throughout the MS., as may be partially seen in the photographic copies inserted in the Deputy-Keeper's first Report, and in the counter reports which have come out under the fostering wing of the Dean of Westminster. And here we may observe, that it is not of the least force to urge, as Mr. Bond has urged, that these stops are not common till the end of the eighth or ninth century, and that they are hardly ever seen before the end of the seventh century. For such an argument to be worth anything—and it would not even then have been conclusive, owing to the paucity of early MSS. to refer to for evidence—he ought to have been able to show that these points *never* occur in any known MS. anterior to the date at which he fixes the Utrecht Psalter. Mr. Thompson asserts, what would be important, perhaps, if it could be proved, that "these marks appear to be contemporaneous with the writing, the colour of the ink being the same. In ancient MSS. there are usually either no stops, or simply the full point." As against this we have Sir Thomas Hardy's expression of opinion that the colour of the ink is *not* the same, nor the punctuation contemporaneous, but that the point alone appeared in the original MS., the virgule which turns it into a semicolon proper, or inverted, being afterwards

added, not to mark the pauses in the sense, but simply as the musical notation employed in chanting (p. 31). Now here is a point about which any person who has eyes can judge for himself, and we should be content to take the judgment of any fifty or a hundred persons selected at random as to the comparative colour of the ink used for these stops, and that employed in writing the rest of the MS. We have no doubt that when the question was put to them, four out of every five would judge that, in many cases at least, the ink of the punctuation was fainter in colour; and that all would agree that the instrument with which it was executed had a finer point than the one used for the rest of the Psalter. This does not, of course, prove anything more than this, that the punctuation was added afterwards by some person, either the original corrector of the MS. or by some other scribe, perhaps after a considerable interval of time. And so it is important to enquire further into the nature of these stops. Apparently they consist of the full-stop, as it is now called, i.e., a single point, and the two kinds of semicolon, erect and inverted. The Deputy-Keeper is of opinion that the original MS. contained only the first of these three stops, and that the others were added afterwards, not to mark the sense, but to assist in chanting. And it seems to us quite plain that some of the full-stops existed in the original MS., and that some of these had the virgule afterwards added to them, whilst in some cases the whole of the erected and inverted semicolon was added afterwards. We may add that in all three cases they appear to have been very capriciously put on in certain instances, whilst upon the whole the last two forms are where they might have been expected to be.

Another exception has been taken to the antiquity of the MS. from the fact of certain contractions occurring in it which it is said are not usual in the most ancient MSS. And here no question is raised as to the abbreviations of sacred names and titles, which, however, it may be observed, are somewhat capriciously written—sometimes at length, and sometimes in the contracted form. But both the authorities of the British Museum lay great stress upon the mark of a waved or curved stroke used as an abbreviation for the termination *ur*, which leads them to suppose the MS. to be of the eighth or of some later century. This contraction is also used very capriciously. As other abbreviations are certainly found in MSS. as ancient as the date claimed for the Utrecht Psalter, the whole stress of this objection must rest on this particular form of contraction; and Sir Thomas Hardy has taken the trouble to ascertain how many times this form of ending occurs in the Psalter. It appears from his analysis that, of 425 times in which it is used, twelve instances occurring at the end of a line exhibit the disputed mark of contraction, and four more in the middle of a line. This accurate enumeration of the instances of its use is of great importance, whether the reader can go along with Sir Thomas Hardy's explanation or not. He asserts that these abbreviations were in all cases added long after the MS. was written, that the

colour of the ink plainly shows this, and that probably they are contemporaneous with the addition of the erect and inverted semicolons which indicate musical stops. To make good this assertion it is necessary further to suppose that the scribe was guilty of carelessness in each instance, which perhaps is not a difficult supposition when it is remembered that similar omissions occur in other words, both at the end of a line and, though less frequently, in the middle of a line. Sir Thomas has quoted two or three, but he has not strengthened his case, as he might have done, by enlarging on the general carelessness of the transcriber of this MS. Not to go beyond the four pages which are appended to the Deputy-Keeper's first Report, we have *unigenite* for *unigenite*, *miserere* for *miserere*, *Jesus* for *Jesu*. The syllable *Pa* in *Patrem* repeated, *Virginæ* for *Virgine*, *Catholicam* for *Catholica*, *tote* for *tolte*, *saluta* for *salute*. From this it will be seen that there is an average of two mistakes to a page. Without bearing this in mind, the hypothesis of sixteen blunders in the rest of the Psalter, which admitted of being remedied in the way suggested, might perhaps scarcely have been thought tenable. And it may be added to this, that the original scribe certainly did not resort to the contraction of the syllable *ur* except under compulsion, as is evident from the bottom of the first page of the Athanasian, when there was plenty of room for the word "prohibem," whereas he wrote *prohibe*, and after leaving ample space for the addition of the letter (*u*), placed the whole syllable *mur* by itself underneath, like a catchword in a modern page. But whether this be so or no, it does not appear to us at all a violent supposition that where the same mark was made to do duty for so many different contracted syllables, it may have been used in extreme necessity for the termination *ur*, though, it may be, no other undoubted instances of the sixth century can be found to bear out the supposition.

As regards the other opinions the Deputy-Keeper has thought it his duty to examine, we do not think they are worth the attention he has bestowed upon them. Canon Swainson has travelled out of his way in more than one direction, but in no place has he made a more ridiculous mistake than in assigning the drawings of the Utrecht Psalter to a later date than the copy which was made of them in the tenth or eleventh century in the Harleian MS. 603. Sir Digby Wyatt is undoubtedly an authority on such points, and he is of opinion that, though earlier than the Harleian MS. drawings, they are of the middle of the eighth century. He says (p. 43):—

"One might readily believe that the Harleian may have been executed by an illuminator having only the Utrecht (or a replica of it) under his eye; but I feel as strongly as an artist may do that the Utrecht—at any rate as far as the text throughout the Psalter and the pictures, certainly as far as the series executed from the beginning by the original artist's hand are concerned—was probably done at about the middle of the eighth century, and from a much more ancient model, written with few contractions and more classically formed capitals, and with freely painted illustrations, originated under strong Latin early Christian influence."

It is difficult in any case to reply to a

feeling, especially when that feeling is an artist's feeling. And it would scarcely be thought worth much if a non-professional person were to give an opinion on such a subject. But in direct opposition to Sir Digby Wyatt's opinion, we have that of Mr. Howard Payn, who, if we estimate him only from his letter to Sir Thomas Hardy, inserted as Appendix II., is evidently a most accomplished judge of art, and who gives most cogent reasons, from internal evidence of the subjects and their mode of treatment, for assigning the drawings to some period between the second Council of Constantinople in 553 A.D., and the destruction of Alexandria in 638 A.D. And thus, if this opinion be accepted, the concurrent testimony of the drawings and the text points to the Psalter being the production of the latter part of the sixth century. We shall content ourselves, therefore, with saying that Sir Digby Wyatt, when he gives an opinion as to the text of the Psalter, lays himself open to the observation, *Ne sudor supra crepidum*; that we conceive that—whatever becomes of the date of the drawings, which everybody is agreed were added after the MS. was written—when it is considered that there is no supposable reason for the forgery of a Psalter of the ninth century in a hand of the sixth, which no one denies is obsolete before the ninth—the evidence for the date of the Utrecht Psalter being assigned to the sixth century is almost irresistible.

We have done but scant justice to the learning or the industry of the Deputy-Keeper of the Records; but we trust we may have done something to extend the knowledge of his two valuable Reports in a wider circle than the Reports themselves will reach. It is much to be regretted that they have not been published in an ordinary way. Is it too late to hope they may be reprinted in a more accessible form than two very large quarto volumes—in order that so valuable an argument may be made more accessible to the vulgar?

NICHOLAS POCKOCK.

Songs of Two Worlds. By a New Writer. Second Series. (London: H. S. King & Co., 1874.)

It is sometimes easier to speak of a second book than of a first, because a critic has only to consider the quality of an author's success when the public has determined the quantity of the success already. The reception of the "New Writer's" first series shows that in his degree he is one of the poetical forces of the time, and this being so, it is interesting and instructive to analyse the nature of his talent. It is recognised that the journalist who says articulately what the average cultivated man thinks inarticulately, performs a useful and indispensable function: the "New Writer" has shown his ability to perform worthily the analogous function of singing what the average cultivated man feels inarticulately. It is true that this function has been hitherto regarded as less indispensable than the other; but it is quite as legitimate and more difficult, and so perhaps more valuable when it is attained. It is one kind of distinction for a poet to secure public attention to remote

or transcendental interests, to which but for the poet the public would have remained indifferent; it is another kind of distinction to raise ordinary familiar interests, which of themselves are apt to be the occasion of mere ignoble excitement or perplexity, into sources of pure serene emotion. For instance, most men have been at some time or other more or less moved by reading Tennyson's "Two Voices," and again, by reading the passage of Mill's *Autobiography* in which he describes his desolation on discovering that his father's teaching was not all sufficient. The "New Writer" has been moved like them; but he is a poet; he could not be simply moved and go his way in silence, and so he has written the "Touchstone," which, without being the best of his poems, is a clear and adequate exposition of a state of feeling which ought not to be regarded with indifference.

One question which exercised the reviewers of the first series of *Songs of Two Worlds* was whether the writer should be regarded as an original genius, or simply as an accomplished imitator. The same question might have been asked of Horace, and this shows that it is worth asking and, if possible, answering. The fact is, there are poets who originate new literary motives and effects, either taken directly from experience, or transcending it; there are versifiers sometimes astonishingly clever and almost delightful, whose *primum mobile* is simply the emulous excitement with which they are filled at the sight of these motives and effects; and between the two there is a class of real poets whose invention limits itself to combining and exalting and refining upon the suggestions which they assimilate, without the power of transforming them, from the best average life of the day, and the best literature which happens to be in vogue. Of this school of poetry Horace is the highest master, and the "New Writer" is a not undistinguished pupil.

It would be a perverse fastidiousness to throw aside poems like "The Organ Boy," or the "Ode on a Fair Spring Morning," because one is full of suggestions from Matthew Arnold dashed with Swinburne and Virgil, and the other adds little in the way of thought to what Mr. Palgrave may be held to have added to Wordsworth's "Intimations;" or to treat "Processions" and "Marching" as worthless, because they are chiefly valuable for metrical and ethical effects both caught from Longfellow. Sweetness and clearness of form and sincerity of feeling, with a life behind it, should always be enough to give a rational and wholesome pleasure that will bear to be repeated. A genuine poet need not be always original, any more than an original poet who invents his whole literary stock in trade is certain to be genuine.

Not that it would be fair to imply that the New Writer is nothing but a manly Aeolian Harp, with good instincts and a clear conscience, who lets the winds of contemporary song play over him at random. On the contrary, he has thought a great deal, and to good purpose, of himself and his character and his position, and the use it might be well to make of them. We learn from the dedication "To an Unknown Poet," that he is an ardent admirer of Henry Vaughan the Si-

lurist, and half hopes for himself the same kind of immortality without notoriety. From "The Hidden Self" we learn that he has a very delicate aversion to being overrated; and, from "A Remonstrance," that he has reached the conviction that the poetical moments of life are rare, and that poets ought to wait for inspiration. From the "Apology" we learn more—he is obstinately and rationally determined to be at once strictly modern and strictly poetical, to avoid all archaic romanticism, all the brutal anachronisms of neopaganism, and the super-subtle play of dramatic and psychological analysis.

The following stanzas are as good a statement as could be wished of the poetical motives which remain:—

"Not less my song aspires to tend
To one unchanging end,
By lofty aspirations stirred,
Through homely music, daily heard,
Trite phrase and common word,
Simple, but holding at the core
Thoughts which strange speech and varied lore
Have hid from men before.
To lift a little howsoever
The hearts of toilers struggling here,
In joyless lives and sore.
To make a little lighter yet
Their lives by daily ill beset,
Whom men and laws forget.
To sing, if sing I must, of love
As a pure spell, with power to move
Dull hearts to things above.
But choosing rather to portray
The waning tides of thoughts which stray
Through doubting souls to-day."

The love-verses correspond to this description: they are at once delicate and fervent and perfunctory. The theological are unequal, as might be expected during the anarchy and confusion of thought which prevail at present, and are, perhaps, least unfavourable to

"A faith which occupies the heart,
Tho' the brain halts to bear its part,
Which threat and promise fail to move,
Like the dim consciousness of love."

The beginnings of this faith are described in eight stanzas, which have the merit of being incontrovertible, so far as they go. The author does not shine in controversy. "The New Order" is simply unreasoning improbable optimism, and in "Tolerance" and a "Hymn in Time of Idols," the author fails to make equitable allowance for the fanaticism and obscurantism which are inevitable when a faith which has lost for a time, if not for ever, its hold upon knowledge, is struggling to keep its hold upon life by tightening and straining its hold upon feeling, while knowledge which is at variance with feeling and faith must lead often to the type of wooden bigotry which is described in "The Professor" in a tone of indignant and irrational surprise.

It is a relief to turn to the bright natural wholesomeness of the "Cynic's Day Dream," which is a description of the simple sober happiness which the "Cynic" would look forward to if the world were a little more obviously equitable. "In the Park" is a rather crude expression of unnecessary anger at the display of stockbrokers' wives. "In Memory of a Friend," is a dignified and graceful tribute to the memory of the late Attorney-General of Jamaica, which, like "Gilbert Beckett and the Fair Saracen," and several other poems, reminds us of

Matthew Arnold, by the union of clearness, sobriety, and refinement, though the "New Writer" with less elevation, less subtlety, and less austerity, has more warmth and perhaps more ease. The following poem is perhaps the best and most individual thing in the volume:—

"Oh, snows so pure! oh, peaks so high!
I lift to you a hopeless eye.
I see your icy ramparts drawn
Between the sleepers and the dawn.
I see you, when the sun has set,
Flush with the dying daylight yet.
I see you, passionless and pure,
Above the lightnings stand secure;
But may not climb, for now the hours
Are spring's, and earth a maze of flowers.
And now, mid summer's dust and heat,
I stay my steps for childish feet.
And now, when autumn glows, I fear
To lose the harvest of the year.
Now winter frowns, and life runs slow,
Even on the plains I tread through snow.
While you are veiled, or dimly seen,
Only reveal what might have been;
And where high hope would once aspire
Broods a vast storm-cloud dealing fire.
Oh, snows so pure! oh, peaks so high!
I shall not reach you till I die."

G. A. SIMCOX.

Studien und Skizzen zur Geschichte der Reformationszeit. Von Wilhelm Maurenbrecher. (Leipzig: Grunow, 1874.)

THE custom which prevails among the authors of other lands of issuing their contributions to periodical literature in a collective form is growing more frequent in Germany, and we have a fresh example of it in the volume before us. As a book ought to be a connected whole, and not a chance combination of unconnected parts, the custom deserves little approbation. But it is impossible to refuse a welcome to the volume before us, which contains a series of papers devoted to a single subject, "The History of the Age of the Reformation," by a writer who has made that subject his own by previous efforts.

Many traces of the periodical form in which these papers were first published have unfortunately been left to annoy the reader. Such expressions, for instance, as "Realpolitiker" and "Habsburger Projectenmacher," are out of place in a scientific exposition. The two prefaces, likewise, which introduce the Essay on "The Elector Maurice of Saxony" should have been condensed into one, and room should have been found for more than a few passing remarks on the replies of Waitz and Cornelius to it in its original form.

Among the sketches here collected, all but two have already appeared in print. Of these two, the second, "The Universal Church and the Territorial Churches," is written with careful reference to original documents. But the subject is too extensive to be dealt with on such a scale. It treats of the efforts made by the nations of Europe to attain to ecclesiastical independence, in opposition to the all-uniting, all-embracing power of the Papacy, from the times of Gregory VII. to the attempt made by Luther to reconstruct the Church on the foundation of the new opinions. In order

to exhaust the subject, it would require to be discussed in some monograph upon a large scale; the treatment of Herr Maurenbrecher hardly fits into the frame of a book which has only to do with the Age of the Reformation.

The other article, which has not been hitherto printed, "The Diet of Worms, 1521," is an attempt to throw light upon a well-worn subject, with the help of new materials, namely, the despatches of the imperial ambassador Manuel from Rome, and those of the papal Nuncio Alcander from Worms. In this essay, as in all the others, Herr Maurenbrecher makes no attempt to clothe his facts in a striking narrative, but contents himself with laying before the reader the views and arguments of the actors, so as to leave it to him to form his own conclusions. Sometimes, in my opinion, Herr Maurenbrecher goes too far, and by withholding all moral criticism appears to present in a fair light actions which are condemned by others, as, for instance, in his explanation of the conduct of the imperial confessor, Glapion, and of the acts of the Spanish Inquisition.

Of the remaining essays, previously printed in various periodicals, two treat of German history: the one, "The Literature of Luther's Day," passes a rather sharp criticism on the latest works on the Reformation and the Reformer—toosharp, indeed, to be unhesitatingly adopted, as, for instance, his final remark on the work of Kahn on the Reformation, is "that a history of Luther is possible only to him who is content with writing history, without constituting himself the propagandist of any theological opinion whatever." In another article, "The Elector Maurice of Saxony," Herr Maurenbrecher discusses the political acts and views of this prince. But instead of constructing a representation of the actor from the facts, he attempts to thrust among the facts his own conception of the different phases in the development of this remarkable man. He points out that there were three periods in the life of Maurice: the first before 1547, in which he defended Protestantism while he was still, with a view to his own advancement, in close dependence upon the Emperor; the second, in which he, while yielding to the Emperor, is yet anxious to save Protestantism and to preserve the independence of the Princes; and the third, in which he aims at securing peace for the Empire, but is prevented by his early death from revealing the great plans which he had conceived. These three periods, which do not appear to me clearly distinguishable in history, are not, even in the essay itself, very plainly divided from one another. Nor will everyone be ready to concede the propriety of raising Maurice to so commanding a pre-eminence.

An article on Charles V., the person who, as ruler of both countries, has always occupied an important place in the investigations of scholars, carries us from German to Spanish history. The article is something between a narrative and a study of character, and in consequence of its mongrel nature is most unsatisfactory to the historical investigator, or even to any tolerably well-informed reader of the history of the Reforma-

tion. Especially to one who knows Maurenbrecher's work on Charles V. and the German Protestants, it can scarcely offer anything new. Nor will the uninstructed reader be benefited by it, as it neither exhausts the subject, nor gives in a striking outline a picture of a ruler who contrived to make himself obeyed and feared.

The three sketches which deal with Spanish history: "Juana the Crazy," "The Reformation in Spain," and "Spain under the Catholic Kings," are the most attractive. One of these certainly—that devoted to the unhappy mother of Charles V.—leaves many doubts behind. It is a pity that the writer has not said more of the results arrived at by Gachard and Rösler's investigation of the truth of Bergenroth's denial that Juana was really insane; even a fresh examination of the subject by Herr Maurenbrecher himself would not have been unwelcome. The other two articles deserve nothing but praise.

The greatest value of the papers collected in this volume consists in their providing the inquirer with a carefully prepared and complete list of the literature relating to the time, which is all the more welcome since we have no handbook treating bibliographically and critically of the literature of the Reformation period in a manner similar to that employed by Potthast and Wattenbach in their well-known works on the historical literature of the Middle Ages. To the general reader the book offers interesting detached studies, prepared in a scientific spirit, which will render them valuable to the lover of history, whilst it is free from all effort after that false popularity which is so often aimed at in the place of perspicuity.

LUDWIG GEIGER.

The Story of the Ashantee Campaign. By Winwood Reade, the *Times* Special Correspondent. (London: Smith, Elder, & Co., 1874.)

Coomassie and Magdala. By Henry M. Stanley, Special Correspondent of the *New York Herald*. (London: Sampson Low & Co., 1874.)

EXCEPTING the section of Mr. Stanley's overgrown volume relating to Magdala, these are books of no enduring value. They have a present interest, but once read will be preserved only in military and official libraries, for reference whenever we may be embarked in another expedition against Coomassie—or against that other dark place of Africa, full of the habitations of cruelty, Dahomey. Every incident of Sir Garnet Wolseley's brilliant expedition is still fresh in public memory, and this alone will secure readers for books, which, it is needless to say, are also thoroughly readable. Both authors are masters of the ready, direct, and graphic style of English writing which is the first literary qualification of the "special correspondent." Mr. Stanley, indeed, shows himself the more apt and successful newspaper writer, but Mr. Winwood Reade's letters make the better book, being written with the fullness of experience and knowledge of Africa and its people, in which he is unapproachable amongst English authorities. But this is not enough to redeem the ephemeral cha-

acter of his book. It is discredited, also, by the bitterness with which throughout it Sir Garnet Wolseley's conduct of the expedition is assailed. The author is so clearly and wilfully biassed against the General-in-Chief, that notwithstanding his having enjoyed the exceptional advantage of witnessing the three great events of the campaign—the storming of Amoafu by the Black Watch, the storming of Ordashu by the Rifle Brigade, and the taking of Coomassie by Sir Archibald Alison and Colonel M'Leod—and, it must in fairness be added, in spite of the exceptional position held by him as *Times*' correspondent, Mr. Reade's *Story of the Ashantee Campaign* cannot be accepted as a trustworthy judgment on the expedition, except in so far as his criticisms of the military and diplomatic acts of Sir Garnet Wolseley are supported by the opinion of other writers and witnesses. Mr. Reade's book was, indeed, on its first issue peremptorily recalled by the publishers to be re-issued, cleansed of its more "perilous stuff," and this sufficiently illustrates the inconsiderateness with which its sweeping condemnations, and sometimes sinister imputations have been made public. If it was worth while republishing his letters at all, Mr. Reade should have reprinted them exactly as they appeared in the *Times*. As it stands, *The Story of the Ashantee Campaign* is a wasted book.

If it was necessary to publish *Coomassie and Magdala* in one volume, it ought rather to have been entitled *Magdala and Coomassie*. Mr. Stanley's account of the Abyssinian expedition is the best and fullest we have yet had. It is admirably written—in style, and tone, and spirit; and with a few additions from Major Holland and Captain Hosier's official history, might easily be made the standard authority on Sir Robert Napier's great and instructive campaign. With more and better engraved illustrations, it would make a first-rate school prize book. But while *Magdala* must always be popular, it is altogether in unworthy company bound up in one volume with the author's *Coomassie*. Nothing could be more light, and brisk, and captivating than Mr. Stanley's account of Sir Garnet Wolseley's expedition, and in the form of a refreshing and perishable occasional volume it would in its way have been perfectly unobjectionable. But bound up with *Magdala* its bulk is apparently doubled, and five or six hundred pages are too much to give to the history of an expedition told in the airy, sparkling style in which the adventures of a midsummer picnic party—to put down the grasshoppers—might be written.

Whilst on the voyage out Mr. Stanley procured a copy of Sir Garnet Wolseley's *Soldier's Pocket Book*.

"Amid much valuable matter, purely military, I came to Sir Garnet's opinions concerning newspaper correspondents.

"If my memory serves me right, Sir Garnet calls correspondents a 'curse to modern armies.'

"And in other places he has bestowed opprobrious epithets upon the Press corps, among which is the term 'drones.'

"Dropping the book on my knees, I picture to myself the kind of man the military author must be. I have never seen him, and I have only this excessive animus to the Press corps to guide me in my fancy portrait. A primish man, of a

Spanish cast of face, very stiff, formal, sour, crusty, vain, and afraid of criticism, conscious perhaps that he might commit faults and would fear being reviewed.

"I ask a gentleman on board, 'Who are on Sir Garnet Wolseley's staff?' I am answered—

"Captain Brackenbury for one."

"Ah! yes. Brackenbury, of course, the *Times* man. A military correspondent: nothing would ever stop him from writing to the *Times*. Strange that Sir Garnet, with his unconcealed hatred to newspaper people, should choose such an indefatigable caterer for the Press as Captain Brackenbury. Who else, pray?"

"Lieutenant Maurice."

"What, Maurice, the author of the Wellington prize essay? He is another Press writer. I would bet anything he writes for one, if not two, newspapers. You need not name the others; I will take it for granted they are mostly all newspaper writers in military clothes."

"Apart from his hatred of the 'gentlemen of the Press,' as he facetiously terms them, Sir Garnet shows himself in his book as a man who would dare anything rather than brave defeat; he shows himself energetic and a master of all military detail, from the smallest minutiae of an officer's outfit to the most difficult tactics for an army. Were the book reviewed bit by bit, there is many a place where Sir Garnet might be hit very strong on tender points. Taken as a whole, it is a good instructor for officers, a treasury of knowledge for engineers, doctors, mechanics, drill-masters, generals, commissariats, for anybody you please connected with an army; in short, it is the work of a thorough soldier."

This is in chapter the first. In the second he meets Sir Garnet, and describes him with delightful humour. Captain Butler steps up to Mr. Stanley with a gentleman and says:—

"Mr. Stanley—Sir Garnet!"

"This stately little gentleman of proud military bearing, quick bright eye, broad high forehead, ardent temperament, a sparkling vivacious intelligence animating every feature—this is Sir Garnet Wolseley—the pacificator of the Red River, and the young hero chosen for the command of the British expedition to Coomassie."

"He is the very reverse of my conception of Sir Garnet Wolseley, who called the gentlemen of the Press 'drones' and 'a curse to modern armies.' If he had not been a soldier by his appearance, I should judge him to have made a first-rate special correspondent—just the man to have seized an item and dared a general-in-chief to lay hands on him, just the man to be sent to any part of the world to collect news. His eager eyes betray the inquisitive soul and indomitable energy. Taking no offence whatever at his sharp-tempered criticism of the "necessity of the age," I admit at once that the British Government could have found no worthier man to entrust the castigation of the Ashantees to than Sir Garnet Wolseley."

Mr. Stanley, it will be seen, draws pertinent attention to the fact that several officers on Sir Garnet Wolseley's staff served in the expedition also as newspaper special correspondents, and it has been suggested that the War Office should in future forbid this growing practice. But surely it is a very weak suggestion. Whatever possible offence there may be in such arrangements is not against the Government but against the public, and it is rather public opinion which should if necessary put down the practice than the War Office. We may rely on it that no official secrets, nor anything damaging to the credit of the Government or the service, would ever ooze out in the letters of a general-in-chief's staff "special correspondents," and that even notorious blunders

would be extenuated and justified to the utmost; and these are advantages to which any Government will always be fully alive. It is impossible, of course, that military correspondents on active official service can ever supersede independent "special correspondents," and were there any danger of their doing so, public opinion would certainly cry out against, and put an end to their employment. But, in fact, they have never been employed except as supplementary correspondents, with equal advantage to the Government and the public. The Government is secure of having the fairest and best interpretation put on its policy and the conduct of its commander, and the public gains the great advantage of having the military incidents of a campaign described by military experts; whilst independent criticism on them is secured by the ubiquitous presence of the civilian "special correspondents" proper. In fact, the employment of military officers as newspaper correspondents can now no longer be forbidden, and has only to be regulated so as, while allowing the utmost latitude to the practice, to maintain discipline unimpaired. Probably the best thing would be that military correspondents should be obliged to sign their letters. In Mr. Henty's *March to Coomassie*, a really invaluable history of the expedition, the breakdown of the transport arrangements is very plainly described and explained; and only an independent correspondent, owing allegiance to no one but the editor and proprietor of his newspaper, could have written so unreservedly and instructively on this subject; and it is to fail in the highest purpose of the history of a war, if its blunders and fiascos are not mercilessly exposed and denounced. We would appear to have undertaken the Ashantee expedition in utter ignorance of the country and people. The episode of the projected railway to the Prah shows this, and it is a fact that should never be forgotten. But "all's well that ends well," and at least no blame can be attached to Sir Garnet Wolseley, who loyally and dashingy carried out his orders to the letter. The one great blot on the expedition is that it failed to put an end to the practice of human sacrifice in Ashantee. Once entered on the war, we ought never to have turned back from it without first securing the perpetual abolition of this infamous rite. Considering the responsibility of the full knowledge we possess of the enormities of these sacrifices, and of our paramount position on the Gold Coast, surely we cannot rest as a nation until both in Ashantee and Dahomey we have utterly stamped them out. It is the basest wickedness in a people that look after book on "the customs" of Dahomey, as by Duncan, Hutchinson, Burton, and Skerchley, should be written and read among them, and they stretch out no hand to stop them. If such books are published and read, and yet fail to rouse the national conscience to the sense of the obvious duty they should enforce, they are more demoralising and brutalising than the cruel shows of the Roman Circus. If, in short, the reorganisation of our Gold Coast Administration does not lead to the extinction of "the customs" both in

Ashantee and Dahomey, the march to Coomassie, for all the host of its historians, was a wasted enterprise, and an indelible stain on the national character and policy.

GEORGE BIRDWOOD.

The Huguenots in France after the Revocation of the Edict of Nantes, with a Visit to the Country of the Vaudois. By Samuel Smiles, Author of "The Huguenots; their Settlements, Churches, and Industries in England and Ireland;" "Self-Help;" "Character," &c. (London: Strahan & Co., 1873.)

THE history of French Protestantism is but imperfectly known, even in France, by the majority of the public; especially are the different periods very unequally known. The first period of that history—the period of its foundation, during which the Reformation was propagated in secret with astonishing rapidity—has never been related in detail, and perhaps never can be, for want of sufficient documents. During the second period—that of the wars of religion from the massacre of Vassy to the Edict of Nantes—the history of Protestantism is so blended with that of France herself, that every educated man is obliged to study it. But with the Edict of Nantes closes the political part of French Protestantism; and the two following periods—that which extends from the proclamation of the Edict to its revocation; and that of the *Desert*, which begins at the revocation and terminates in 1789, at the time when the Constituent Assembly proclaimed the liberty of conscience—are in general unknown even to the well-educated. Some striking facts—such as the siege of Rochelle, the revocation of the Edict of Nantes, the war of the Camisards—still attract attention, but that is all, and the public show no desire for further knowledge.

Yet there are few passages of history more attractive, more instructive, or more tragical than that of French Protestantism in those times of secret contests or violent persecution. Certainly this history deserves a better fate than oblivion; and all Frenchmen, especially all French Protestants, owe sincere gratitude to the writers who endeavour to perpetuate its memory.

Mr. S. Smiles is in the first rank of this small company. Six years ago he related, in a well-compiled and well-written book, the history of the Huguenot refugees in England and Ireland. He now relates that of their brethren who remained in France notwithstanding the revocation, and he renders a just homage to the energy, courage, and sincere faith, of which they afforded so many examples under the fire of persecution.

But Mr. Smiles has not fully described the destinies of the French Reformed Church from 1685, the date of the revocation, to 1789: such an undertaking would have required a much more extensive publication; and perhaps the want of sufficiently numerous documents would have rendered it impossible. But Mr. Smiles has taken pains to disclose the situation and character of French Protestants at that period by relating some of the principal episodes of their

history, and by introducing some of the men most distinguished by their services and by their devotion even to martyrdom.

After describing the revocation of the Edict of Nantes, and rapidly indicating the principal consequences of that iniquitous and impolitic measure, he relates the life of Claude Brousson, the advocate, who, after having defended before the tribunals the rights of the Protestants before the revocation, became a pastor, that he might support the courage and the faith of his persecuted co-religionists, and sacrificed his life to his heroic devotion.

A well-drawn recital of the War of the Camisards* follows the life of Brousson. Mr. Smiles is one of those authors who like to contemplate their subject under every aspect, and who do not reduce similar events under one nomenclature of battles and skirmishes. He describes the places, and makes us acquainted with the men. He has visited the country, has personally inspected the scenes of the principal engagements, and our only regret is that the map appended to this chapter is very inadequate. It is a mere sketch—the book is worthy of a better.

The work of Antoine Court and of Paul Rabaut succeeds that of Cavalier and Roland, a very different and much more useful one. It is not that we agree with those who censure the Camisards and condemn, without any restriction, their taking arms. They did not succeed: with many people this is their great fault. It was impossible that they should succeed: the contest between some peasants of Cevennes and the France of Louis XIV. was too unequal; nevertheless they failed less completely than has been generally supposed. If Antoine Court, Paul Rabaut, and their companions in labour, succeeded in restoring French Protestantism, they owe their success, in part, to the exploits of the Cavaliers, the Rolands, the Ravanel. The fear of seeing the revival of the insurrection for a long time disturbed the rest of the lieutenants of Louis XV.; it acted as a check upon the pitiless magistrates, to whom the rights of conscience were but an empty word; it moderated their persecuting zeal, and after 1746 created in them the desire to place themselves secretly in harmony with the pastors of the Desert, who alone could avert new troubles.

The last chapters of Mr. Smiles's book relate to the end of the persecutions and the proclamation of liberty of conscience in 1789; and the second part of the volume is devoted to the narrative of a visit to the Vaudois of the Alps of Dauphiné and Piedmont. Mr. Smiles traversed the districts evangelised by Felix Neff, those which were so gloriously re-conquered by the Vaudois of Piedmont, under the command of Arnaud, their pastor and colonel; and he at the same time relates what he had himself seen, and the events that had taken place in these mountains whose torrents had been so often stained with the blood of martyrs, with a brilliancy of colour and simple eloquence of style which render his recital very attractive.

To these qualities Mr. Smiles adds that calmness of judgment and impartiality

which form the true historian. No doubt some of his assertions might be called in question: as when on the third and following pages he represents the whole of France, from the *haute noblesse* to the common people, from the men of letters to the *bourgeois* and the soldiers, as applauding the revocation of the Edict of Nantes, we cannot fail to suspect some exaggeration in the picture. The despotism of Louis XIV. had engendered habits of servility and flattery, which appeared in this circumstance as in others, and no one would have dared to blame publicly any act of the King; but there is no proof that the approbation was as universal as the author supposes. That of the clergy is beyond doubt, and that of the common people, whose passions they excited, is nearly as certain; a crowd of persons even in the *noblesse* were enriched by the spoils of the unhappy Huguenots, and the most sordid views of interest dictated their applause. But it is beyond doubt that many others in the *bourgeoisie*, in the provincial *noblesse*, and even in the Court, condemned in secret, or with suppressed voice, the unjust and senseless act the fatal results of which it was not difficult to foresee.*

There are also some points of detail in which we might not fully agree with Mr. Smiles, while in others we are entirely of his opinion. For example, he appears to us to have perfectly understood Cavalier. He regards as wholly unfounded the charge of treason which has been often brought against him. Less fanatical than his companions in arms, and a better soldier than they, Cavalier saw clearly that the contest could not be prolonged without resulting in the ruin of the Camisards; but he knew that the government was inclined to put an end to it. He was not wrong to welcome the sincere overtures of Villars: the arrangement he concluded with him granted to the Protestants of Languedoc not indeed perfect religious liberty, but a kind of well-defined toleration. This was all they could hope to obtain, and there is no proof that Villars would not have kept his word. Unhappily the Camisards, with few exceptions, did not accept his terms, notwithstanding the strenuous efforts of Cavalier to obtain their assent, who was in the right in holding for his own part to the engagement which he had formed. In this point, again, we entirely accord with the judgment of Mr. Smiles.

We may add that the book is well written, lively and animated, and thus in every way deserves the success which the name alone of the author cannot fail to secure to it.

ETIENNE COQUEREL.

Voyage d'Espagne. Par la Comtesse d'Aulnoy. Revue et annotée par M^{me}. Carey. (Paris: Plon, 1874.)

MDME. D'AULNOY is one of the fortunate writers whose names have become attached to books which are never quite forgotten. The odd vitality of fairy tales informs the collection which she made, and she is sure to be remembered as long as the *Yellow Dwarf* and the *Princess Frutilla*. But in

some respects her nursery stories have harmed her literary fame, and she has been gravely suspected of letting her love of romancing carry her too far, in her *Voyage d'Espagne* and *Mémoires de la Cour d'Espagne*. M^{me}. Carey, who has diligently annotated a new edition of the former work, marks off with notes of quotation a few rather tedious tales which the worthy Countess thought fit to foist into her letters. But it is unlikely that M^{me}. d'Aulnoy did this with intent to deceive. She had a fair reputation for writing novelettes in the manner of *Le Grand Cyrus*, and no doubt she was aware that her correspondents would set their proper value on her fictions. A similar excuse may be given for the obvious invention of three cavaliers who met the Countess at San Sebastian, and accompanied her on her way to Madrid. These gallant men fulfil the office of Mrs. Harris: when the Countess has any heavy information to give, she puts it in the mouth of one of her companions, Don Estephe, or Don Frédéric. Thus M^{me}. d'Aulnoy's friends in France learned without too much trouble how the melancholy Charles II. thought that marriage would make a pleasing change in "that long disease, his life," and how he fell in love, like a prince in a fairy tale, with the picture of Marie Louise of Orléans.

"He never leaves the portrait, he wears it next his heart; he says sweet words to it that astonish the courtiers, for he speaks such a language as he has never spoken before. His passion for the princess supplies him with a thousand thoughts, which he can breathe to no one, . . . he never ceases writing to her, and sends off special couriers every day to carry her letters, and bring back tidings of her."

The fairy princess came, but her coming was of no avail. She could not waken into real life that unhappy king, that strange enchanted court, spell-bound by etiquette and by superstition. Mary Stuart was more fortunate when she left sweet France for the grey coasts of the North, than Marie Louise when she crossed the mountains into this land of savage religion and cruel loves, where the Inquisition seemed to have brought back the bloody rites of Mexican Vitzlipoutzli, and no breeze softer than the African sirocco blew through the groves of the *pays tendre*. But M^{me}. d'Aulnoy only tells the story of the Queen's arrival in this volume; her *mémoires* and the letters of the Marquise de Villars continue the melancholy narrative.

Spain at the end of the seventeenth century was the least European country in Europe. The Moors seemed to have bequeathed to her Oriental jealousy, along with Oriental manners; Mexico seemed to have inspired her court with the Aztec ferocity. In that dull society, where, as M^{me}. Villars told the Queen, there was an *ennui* that could be felt and seen and handled, nothing pleased but devotion and bloodshed. Both were combined at the *autos da fé*, where Jews were the victims; at the bull fights, where the grandees of Spain laid down their lives; at the wild penances of Lent, where flagellants ran about the streets, torturing themselves for the honour of their ladies. These were the delights of Madrid, varied by walks in the bed of the Manca-

* This narrative, as well as that of the travels of Mr. Smiles in the valleys of Vaudois, had been previously published in *Good Words*.

* See on this subject De Felice, *Histoire des Protestants de France* (Paris, 1870), p. 410.

narcz when it was not too dusty, and by drives in closely shut carriages. Even the Queen might not drive in an open carriage, it was thought immodest. The men were uneducated, dissolute, idle; even the pleasure of the chase was almost impossible. Hounds could not run on the parched plains, and in the battues the King kept all the best shooting for himself. Saint-Simon observes, some forty years later, that he shot a fox for his part, and was guilty of the rudeness of wiping the royal eye, even in that un-sportsman-like exploit. The women lived in almost Moorish seclusion, only seeing their lovers now and then among the religious dissipations of Easter-tide. Yet they did not want *esprit*, Mdme. d'Aulnoy says, though they sat on the floor at meals, drank water that had been kept too long in clay jars, and took chocolate and bon bons at every hour of the day. Their taste for eating clay was one of their oddest peculiarities, for it made them yellow and shrivelled, though they thought it an antidote against poison. Their dress was hideous in Mdme. d'Aulnoy's eyes, and that of the men was not much better. They all encased their necks in the huge buckram *golille*, a decoration invented by Philip IV. when in the prime vigour of his fancy. So pleased was this prince at his discovery, that he instituted a fête to commemorate it. Mdme. d'Aulnoy once heard Charles II. say that it was so hot he thought he really should take off his *golille*, and this is perhaps the most original notion which history attributes to the lamented monarch. The *golille* was a kind of outward symbol of the etiquette which was strangling Spanish society, converting every man into more or less of a *hidalgo*, to whom trade would be degradation, and labour impossible.

To reach Madrid, the scene of these customs and festivities, where her mother lived as a pensioner of the King, Mdme. d'Aulnoy had to travel through the poorest, dirtiest, most thievish and comfortless of European countries. Happily her character was a cheerful one, for the journey would have been a trial even to the courageous ladies who now live on Liebig's portable soup and open air in the Dolomites. People who clamour for Condy's disinfecting fluid all over the continent from Calais to Constantinople, would not have survived the journey at all. Mdme. d'Aulnoy's first trouble was with a notary, who with native politeness, contrived to seize her watch, which she had lent him to look at. Her next annoyances were the unceasing custom-houses, where she was told plainly that the foreigner's ignorance was the Spaniard's opportunity. The inns she found it best to regard as a practical joke. There was no accommodation, no cookery, no food, except what the traveller carried with him, or could buy in the neighbourhood. Starvation was indeed general over all the country.

"J'ai vu des personnes de première qualité manger avec nous comme des loups, tant ils sont affamés; ils y faisaient réflexion eux-mêmes, et nous priaient de n'en être point surprises, que cela venait de ce qu'ils trouvaient les ragoûts, à la mode de France, excellents."

So Mdme. de Villars tells that Charles II. used to watch the Queen eating, and seemed

to think she ate too much. The poor queen had few other amusements.

In spite of extortionate landlords, mosquitoes, garlic, bad weather, broken roads, floods, and storms, Mdme. d'Aulnoy marched gaily through the north of Spain. She showed some taste for Gothic architecture and mountain scenery. She inspected some miraculous shrines, and a few haunted houses, with the same good-natured unbelief; she listened to stories of the evil eye, and trembled not, and doubtless was held an *esprit fort*, like Philip V. in later years, when he laughed at his courtiers for ringing little bells in a thunderstorm. Bells, indeed, played a great part in Spanish superstition. There was one at Barcelona which tolled before great misfortunes, and another at Vililla, on the Ebro, which rang of its own accord on the death of Charles V., of Philip II., and of his last wife Queen Anne. These remarkable bells are worthy of the attention of Mr. Alfred Wallace, and of people who look on the ringing of "Bealings Bells" as a proof of the immortality of the soul. Mdme. d'Aulnoy mentions another cheery Spanish belief, that persons born on Good Friday can see a corpse in any place where a murder has been committed. In fact, her whole *Voyage d'Espagne* is a mine of the richest gossip, and a valuable study of society in the most bizarre decadence. The court of Henri of Valois was more wicked perhaps, but it was not stranger. Mdme. Carey has done a service to literature in reprinting, with copious and interesting notes, this record of the good old times in Spain. Whether the book is likely to reconcile Spanish republicans to the glories of a Bourbon restoration, is another question. The book is an admirable specimen of the memoir, that pleasant and talkative waiting-maid of the severe Muse of History.

A. LANG.

Recueil de Chansons Populaires Grecques.
Par Emile Legrand. (Paris: Maisonneuve et Cie., 1873.)

M. LEGRAND, who is already favourably known to students of modern Greek literature, and whose publications have been repeatedly noticed by us in the former volumes of the ACADEMY, has recently published a splendid and original collection of modern Greek popular poetry, forming a stout volume of 676 pages, independently of an Introduction of 43 pages—a volume remarkable both for the soundness of the scholarship displayed in it, and for the elegance of its typographical execution. A main feature of this book consists in the French translation, which will no doubt contribute to increase the popularity of this handsome volume.

The first part of these songs is derived from the Vienna MS. 244, which contains a considerable number of mediæval Greek productions, and among them the earliest extant collection of popular Greek poetry. We feel sure that all lovers of this kind of literature will be gratified by discovering as early as the first half of the sixteenth century, a number of poetical compositions fully equal to those collected by Fauriel and others more than 300 years afterwards. Some of these poems are of surprising originality

(e.g. "The Wine-bibber's Philosophy" and "The Seduction"); while others breathe that delicate tenderness of love so conspicuous in modern Greek poetry. We will give an instance, chosen at random, to show what a simple Greek maid could compose even in those worst times of Greek life, when Greece was oppressed by Turkish despotism. The specimen we select will be found at page 42 of M. Legrand's volume, and its purport will be easily understood.

"The heavens are my paper and the stars are my letters, and this grievous message enclosed in my heart has been read by me, and tears ran from my eyes; out of those tears I made ink to write to you, the point of my fingers I used as my pen, and thus I have sat down to write to you; how you have slighted me, how you have deceived me, and how bad you have been to me, how you hugged me and kissed me and afterwards deserted me."

In another place we are told:—

"By the stars and by heaven, by the sorrows of love, never did mother chastise her son as does the torture of love."

And again:—

"When I happen to see you and cannot talk to you, I heave a sigh, and thus I speak: would I were dead rather than live like this! What should I wish for in this sorrowful life, when my body is tortured and my soul quite gone?"

The second division of the present collection contains a number of historic songs beginning with an interesting poem on the death of the last Byzantine Emperor, and going down to the arrival of King Otho and the assassination of Kapodistria. We cannot, however, entirely suppress our disbelief in the authenticity of the song given at p. 108 *sqq.*; indeed we are quite certain that no popular poet would have used such expressions as we read at v. 13–18, nor can we help thinking that a poem like this should not have been admitted into a collection of popular poetry.

The third part contains poems relative to the cycle of Digenis Akritas, a mythical hero of the middle ages, whose memory still survives in Cyprus and some parts of Asia Minor. There is a poem of some length in existence on this Akritas, which it is to be hoped will shortly be published by M. Legrand.

The rest of the volume is devoted to a miscellaneous collection of poems, many of which are mere variations of subjects previously known. Here also we would observe that the editor seems to have been somewhat lax in his idea of popular poetry, admitting, as he does, such a production as the lengthy and insipid poem on "The Wise Old Man," in 409 monotonous trochaic lines. But remarks like this are by no means intended to detract from the general interest and great merit of this publication, which we once more recommend to students of Modern Greek, and to all lovers of genuine and spontaneous poetry. W. WAGNER.

THE LAST LADY OF RECKENBURG.

Die letzte Reckenbürgerin. Roman von Louise von François. Zweite Auflage. (Berlin: Otto Sanke.)

A VERY good novel has hitherto been a rare occurrence in Germany, probably for the reason which rendered novels in general

comparatively so. Many circumstances may have contributed for good and for evil to preserve that country from such a deluge of fiction as pours from the English press; but the fact is sufficiently explained by the incompleteness of social development which has deprived the German world of the legitimate materials of this kind of literature. The infinite combinations of character and circumstance which are created by modern life could find no place among the stereotyped conditions of its semi-feudal existence; and for want of a basis of reality both firm and comprehensive, the domestic romance was liable to be either tame or incongruous, and the "Tendenz Roman," or character novel, could only work upon imaginary situations which eluded all received tests of probability. *Die letzte Reckenbürgerin* is, however, sufficient to prove that the romance of Germany is sharing the gradual expansion of its social and political life, and if Fräulein von François had contented herself with the production of this one typical work, her appearance in the world of literature would still be an event. She has shown the artistic originality of a Charlotte Brontë tempered by something of the psychological insight and larger experience of a George Eliot. Her book displays no graces of style, but it has all the realistic and pictorial power which an idiomatic use of the German language could impart to it: a realism which its very intensity renders poetic is, in fact, its prevailing quality.

This supposed autobiography of the last Baroness of Reckenburg opens with the epoch of the French Revolution, but includes reminiscences of the reign of Augustus the Strong, whilst this historic background is relieved by minor incidents of domestic life and character which connect it vividly with the Germany of the present day. The belief in high birth, as not only a social but a moral consecration, so amusingly illustrated by the life of Freiherr and Freifrau von Reckenburg, and the customs of the little Saxon town which they inhabit, has perhaps barely ceased to exist, and the genial humour with which the authoress describes the *ménage* of this noble pair, and the proud simplicity of their subsistence, on an income little exceeding forty-three pounds a year, has a strong suggestion of class sympathy about it. The daughter, Eberhardine or Hardine, heroine of the story, is the natural outcome of her high birth and Spartan education. Simple, prosaic, and strong, she has every instinct of a lady, and as far as the two facts are compatible, not one feminine charm. She is one of those women whom love passes by, but who can accept labour as compensation, and who harden but do not deteriorate. She has her complete antithesis in a kind of foster-sister, the low-born Dorothee Müller, a Hebe in body and sybarite in soul, with a clinging softness which makes her irresistible to others and powerless against herself, and a coaxing casuistry which makes wrong appear right whenever she has any motive for defending it; capable of impulsive and even lasting tenderness, but above all a slave to that blind shrinking from the very thought of pain which so often does the work of cruelty. The two girls are little more than fifteen, when Dorothee be-

comes engaged to the man whom she is to marry after years of separation, and Hardine pays her first visit to the aunt whose heiress she becomes, and with whom she gradually takes up her abode.

The aged Countess of Reckenburg is by nature keen, narrow, and intense—by long habit a miser and a recluse. United by a left-handed marriage to a prince of the blood, who forsook her when he had squandered her wealth, she toiled and hoarded, first that she might win him back, then for the orphan son whom a second and more equal marriage had borne to him, and finally for hoarding's sake. The accumulating treasure in the "Eastern Tower" of the "Reckenburg," and the lonely woman who watched over it, were regarded by the neighbourhood as a somewhat unholy mystery; but she went her own way, kept up a dreary state within her castle walls, and lived and died amongst the shadows of that dream of gratified ambition which had become one with her love. She had been barely the *wife* but she was the *widow* of a prince. Hardine soon gains the confidence of her strange kinswoman, though she never wins her heart; and in her residence with her, in a life as frugal as that of home and more laborious, she acquires those habits of order and diligence, of self-control and of command, which are to fit her for future possession. There, too, she develops a material attachment for the soil on which she works, which will sustain her through many lonely years.

It is part of the old Countess's ambition that Hardine shall some day bestow herself and her inheritance on the princely "ne'er do well" whom she considers as her son, and who is admirably drawn in all the reckless fascination of his peculiar type; but it is Dorothee whom he loves with the ardour of a first passion; Dorothee whom he promises to marry, and whom his death at Valmy leaves sorrowing and in shame. She keeps the secret of this shame to the neglect of every motherly duty, and dies under its weight. Hardine, aided by two faithful friends, protects the childhood of Prince August's truly orphan son, and her exertions in his behalf become the hidden fate that determines her later life.

This story contains two supremely dramatic scenes. The one describes the ball given by the little town for Prince August's reception; its punctilious ceremonial; his undisguised *ennui*; and his sudden starting from a listless attitude at Hardine's side at a glimpse of Dorothee hovering in the background, and whirling her forth in a wild dance which converts the stately *réunion* into a romp. In the second, Hardine is celebrating her fiftieth birthday and the betrothal to a lately widowed friend which is to relieve the monotony of her existence by bringing into it one duty the more. She stands in her gaily-thronged gardens, her noble suitor by her side, in all the prestige of high birth and an untainted name, the gaunt girlhood mellowed into a stately maturity, ancestral diamonds flashing about her person, and in her yet undimmed hair. Suddenly a half-drunken, already-dying soldier bursts into her presence, not to implore, but to demand from his imagined

mother protection for his now motherless child. This moment is the climax of her courageous life. Haughtily refusing the explanation without which her marriage is impossible, she soothes the death-bed, as she once guarded the birth of Prince August's son; lives down the doubts thus momentarily cast upon her; and the child her namesake, whom she had taken to her side from a rigid conscientiousness, which left the deed, nevertheless, a severe and distasteful duty, rewards her at length by opening within her heart the long-scaled springs of maternal tenderness and joy. The last Reckenbürgerin dies at peace with herself and the world. The grand-daughter of Prince August and Dorothee Müller, already happily married, becomes her heir.

It may be objected that this novel contains repulsive incidents, and that they are told with too little reserve. But this directness of presentation is in truth its distinguishing charm. Gustav Freytag says of it:—

"The distinct and vigorous chronicle allows no uneasiness to arise; we entrust ourselves heartily to the moral sense of the narrator; purity of atmosphere, wholesomeness of Nature pervade the book, and strengthen the reader. He is in presence of a poetess *par la grâce de Dieu*."

Herr Freitag's just admiration for the transparent moral atmosphere of Fräulein von François' work, for its freedom from all brooding sentimentality, and all unwholesome suggestion, implies an equally just censure on much of the more conventional lady-writing of the present day.

ALINE ORR.

CURRENT LITERATURE.

A History of France down to the Year 1453. By G. W. Kitchin, M.A., Oxford. (Clarendon Press Series, 1873.) Pp. 598.

THIS should not have been called "A History of France," but "A History of the French Monarchy to the year 1453," for it is a history of France only so far as that history is bound up with its kings. We have nothing of its arts, sciences, and literature; nothing of its morals, manners, and customs; nothing of the growth of its language, commerce, and civilisation; nothing of the progress of its towns, people, and institutions; nothing of its inner and domestic life; nothing of the reflected influence of other states, except, indeed, here and there a word tacked to the end of some royal biography. No doubt the memoirs of a king will at all times make up a large part of the annals of a people; still there is always a concurrent history, which sometimes dominates, and at all times deserves notice. Kings at the most are only constructive and not creative: they may lead a movement, direct and develop it, but can never produce it. If they attempt to make bricks without straw, they fail, or at least stand isolated from their subjects, as did Charlemagne. If, on the other hand, they fall behind their age, and try to roll back the tide of progress, like Charles X., they pass away and leave no mark.

As a history of the rise of the French monarchy Mr. Kitchin's book deserves great praise. It is not a mere *réchauffé* of other works bearing a similar title, but an original compilation from men who lived in the midst of that which they describe. Thus, the history of Charlemagne, called by Mr. Kitchin "Karl the Great," is mainly drawn from the *Vita et Gesta Caroli Magni* of Einhard, his friend and secretary; that of Robert the Pious, from Helgard's memoirs in the *Recueil des Historiens des Gaules*, by Dom Bouquet; that of Philip IV. from William of Nangis and his anonymous continuator in the same collection;

that of Louis VI. from *La Vie de Louis VI.*, by Suger the abbot, his schoolfellow, friend, and adviser; that of St. Louis, from the charming *Mémoires* of the Sire de Joinville, his friend and seneschal; those of Philip VI. and his worthless son, misnamed *le Bon*, from the *Chronicles* of Froissart. This is the right way of going to work, and by so doing the author presents us from time to time with living photographs and graphic touches of character.

Of the spelling of the proper names adopted by Mr. Kitchin there must always be two opinions, but very few will be reconciled to the awkward "Hruodland" for the paladin Roland or Orlando, consecrated by romance and epic poems. Karl the Hammer for Charles Martel is especially objectionable, as it dogmatizes on a word which, M. Planey insists, is simply the name of his patron saint.

A similar objection applies to the translation of several of the character-names attached to the French kings. "Auguste" added to the name of Philip has no relation to Augustus, the Roman Emperor, but refers to his birth-month only. Louis *Hutin* is translated "Lou's the Turbulent," whereas the balance of probability is that he was so called from a seditious people of Navarre, against whom he was sent by his father: so that Louis Hutin is of a similar character to the familiar Roman agnomen *Africanus* given to Scipio, or *Nimideus* applied to Metellus. As these names tell a tale, it is most advisable that they should tell it correctly, or at any rate should not mislead.

A few errors of carelessness may be pointed out for correction in a future edition. Thus, p. xiv., col. 2, Philip II. should be Philip III.; p. 32, Vercingetorix is derived from "the Welsh ravr" (*sic*); p. 322, "he had to throw down the walls of Toulouse herself;" p. 335, they "wasted all their time at the dice;" p. 377, "there were no lack of rumours;" p. 399, "the classes of society was still far apart;" p. 456, "Charles was simply cled;" with some others.

If the first two books had been reduced to half their length, it would have added much to the interest and readableness of the volume.

IN *Familiar Notes on Modes of teaching English*, by Mr. W. S. Lean, Principal of the Flounders Institute, Ackworth, there are some valuable hints on a subject that still requires suggestion and discussion before it can be taught with success. Though differing from Mr. Lean in his opinion that analysis of sentences should precede much parsing, we quite agree with him that pupils may be taught the "parts of speech" from instances supplied by himself in such a way as to be "practising deduction and learning logic" without knowing it. At present the results of teaching English grammar in most elementary schools are deplorable. It is a very common thing for a boy of twelve to have learned English Grammar for three or four years and not to be able to tell one part of speech from another. English grammar, to be well taught, must in the first place be completely emancipated from the influence of Latin grammar, and in the second place must be based on the principle that it is not inflection, but the function of the word in the sentence that determines the nature of each word. Mr. Lean's "Familiar Notes" appear to us a useful contribution towards a reform which, when thoroughly carried out, will quite transform the teaching of English in our public elementary schools.

The Gingerbread Maiden and Other Stories. By Laura Friswell, with illustrations by Mrs. B. Dawson. (Sampson Low & Son.) Children will like this book, and it may safely be given to them. It contains five stories. From the first it takes its name, and to say that "The Gingerbread Maiden" is in the style of Hans Andersen's "Tin Soldier" is to praise it sufficiently. "Mrs. Farthingale's Baby" and "Molodica" are practical stories of naughty children, and will be hailed with pleasure by that large class of small readers who prefer hearing of naughty boys and girls being punished, to

stories of good children who "say beautiful things," and die young. The "Queen of the Roses" is a pretty fairy-tale of the sentimental order, and "The Man in the Moon" draws its principal inspiration from "Alice in Wonderland."

The illustrations by Mrs. B. Dawson are silhouettes, and are clever and effective. It would be well if writers for the young would take a hint from silhouette illustration, and remember that nothing is more acceptable to children than a record of sharply defined incidents upon a light background.

The Modern Avernus, by Junius Junior. (Hatchards.) This book is a curiosity, though it is probable that parallels to it might be found in the wide range of No Popery literature. The author writes quite like a cultivated man, clearly, pointedly, and soberly, without any undue heat or bitterness; his premisses are well arranged, and quite as well sifted, and as well connected with his conclusions as we have a right to expect in ordinary political writing, and yet the whole is absurd. Of course it would be easy and tedious to point out palpable inaccuracies, but these would not be enough by themselves to account for the result, if the writer's habit of dwelling on deductions from incorrect generalisations, and peering into the dark to gloat over the discreditable secrets of which the corners are possibly just in sight, had not incapacitated him for using the obvious means of finding out what Roman Catholics are practically like, and what their chances are.

Philosophy of English Literature. By J. Bascom. (New York: Putnam's Sons, 1874.) The author has mapped out the ground carefully and thoughtfully, but when he comes to fill in his outline he is for the most part shallow and often inaccurate. Unfortunately there is a large public in America, as there soon may be here, which wishes to know all about English literature without having read it.

A Vision of Other Worlds. By H. A. Squires. (Provest & Co.) "Henry Augustus Squires of America" seems to entertain cosmological theories which have led him to paraphrase the "Course of Time" in this dialect:—"Upon those delightful streams glided the noble swan, the widgeon, and the teal, the dabelick, and other swimming tribes, all pleasing to behold."

Philip Ashton, and other Poems. By H. E. Malden. (Hamilton & Adams.) Mr. Malden writes so prettily, so clearly, and with so much finish, in the style of Mr. Tennyson and half a dozen other poets, that it is much to be wished that he may come to have a style and an invention of his own. He has quite enough fancy to be original if he could light upon an independent way of thinking.

The Temple of Memory. By Kenelm Henry Digby. (Longmans.) The interest of this book is chiefly psychological, it might be said pathological. The author of *The Broad Stone of Honour* and *Mores Catholici* still retains his habitual interest in high subjects and his high tone of feeling, and therefore it would be worth while to investigate how he came to pass into his present phase of shipshod garrulity. In substance *The Temple of Memory* (the title is an allusion to a well-known passage in St. Augustine's *Confessions*) is better than most of his recent volumes of verse, and therefore would be a less tedious subject of investigation. In the eleventh book (there are twelve) we find a pleasant anecdote of the late Professor Sedgwick, who sent for the author when he changed his religion to tell him that he himself had lately been travelling in Styria and Carinthia, and thought the Catholic populations of those countries the best people he had ever known.

Yu-Pe-Ya's Lute: a Chinese Tale in English Verse. By Augusta Webster. (Macmillan.) A rendering (such as it is) of a French translation from the Chinese by M. Pavie, published at Paris in 1839. The verses run smoothly enough, as a rule, but the style is strained;

the writer takes some liberties, too, with the English language, and occasionally uses words for which it would be labour thrown away to search in any dictionary with which we are acquainted. In her preface she "pleads guilty to having invented all her geography and topography except the names;" and if she had only invented the names too, there might have been some homogeneity about the book, which is now lacking. There is scarcely anything Chinese about the story in its English garb, and it would puzzle a Chinaman to make much of the names of the personages, &c. The writer tells us that she has "assumed that Yu-Pe-Ya's journey was through northern scenery," and that being the case, she might have taken the trouble to ascertain the proper way of writing names as they would be used in the north of China, instead of blindly copying M. Pavie. Further, the writer is too evidently quite ignorant of the manners and customs of the Middle Kingdom, both in modern times and in the remote age to which the Chinese story refers, or she would never have penned the lines—

" . . . And in his belt he placed

A purse that held in gold ten acres' worth."

Again, in the following lines she gets very much out of her depth:—

Then Lao-Pay unrolled the golden leaves

Wherewith the living tells the dead he grieves."

She refers here to mock or paper money, which is usually made to imitate *shoes* of "sycee," and can hardly require unrolling; the real notion of the Chinese in burning this mock money is to propitiate the spirits of the unseen world, and to provide the departed with (unsubstantial) funds on his arrival there. We have never before heard that it is thus that "the living tells the dead he grieves."

The real fact with regard to this book is that the writer has used the faintest skeleton of a Chinese story as a peg on which to hang a poetical effusion which hardly ever rises above mediocrity.

EDITOR.

NOTES AND NEWS.

THE Catalogue of the Roman Medallions in the British Museum, by Mr. Grueber, edited by Mr. Poole, is now printed. All the well-preserved specimens are engraved in sixty-six autotype plates from casts in plaster, except in the case of the finest specimens, which are from drawings by Miss Godsall. The price of the work is one guinea.

COUNT BLÜCHER, son of the present Prince of that name, and great-grandson of the renowned marshal, has addressed to Colonel Chesney an official letter of thanks, on behalf of himself and his father, in special acknowledgment of the attention paid by the English author, in his *Waterloo Lectures*, to the elucidation of their ancestor's share in the success of the campaign of 1815, and more particularly of the recent vindication, in a new edition of the work, of Blücher's name from a charge of supposed carelessness in connexion with the defeat of Ligny.

THE Belgian Government conjointly with the town of Antwerp are in treaty for the purchase of the house of the celebrated Antwerp printer Plantinus, with its contents, portraits, MSS., printing press, wood-blocks and books still belonging to the Moretus family. B. Moretus was the immediate successor of Plantin. Among the MSS. in this collection there are several which were brought away from All Souls College, Oxford, by one of the fellows who would not acknowledge the Royal Supremacy in matters spiritual. It is possible that these might be got back now; but when once the collection passes into the hands of the Government it would be impossible.

THE wife of one of the most highly esteemed of living water-colour painters is the author of *Thornycroft's Model*, and of the new novel called *Under Seal of Confession*.

MR. RICHARD SIMPSON, the author of the *Life of Edmund Campion*, is editing the few extant ballads on Campion for the Ballad Society.

MR. BURNAND is the author of that parody of a novel of Victor Hugo's which is just now the principal feature in *Punch*.

THE series of *The Dramatists of the Reformation*, edited by Mr. James Maidment and Mr. W. H. Logan, and published by Mr. Paterson, of Edinburgh, is to be increased by the works of the following authors:—John Lacy, one volume; Shackerly Marmion, one volume; John Tatham, one volume; John Burnaby, one volume; Thomas Killigrew, volumes i. and ii. (to be completed in four volumes): the above to be issued in 1874, or early in 1875. The works of the first three authors named—Lacy, Marmion, and Tatham—have never hitherto been collected. In addition, the publishers hope to issue, in 1875 and 1876, the works of George Powell, John Dennis, Charles Johnson, and Charles Shadwell, none of whose plays have hitherto appeared in a collected form, excepting those of the last.

WE regret to announce the death of a contributor to these columns, Mr. W. D. Christie, C.B. He was born about the year 1815, and was called to the bar in June, 1840. After serving for a short time as private secretary to the late Earl of Minto when First Lord of the Admiralty, he gained a seat in Parliament for the borough of Weymouth, which he filled from April, 1842, till November, 1847. From that period until October, 1863, he served in many diplomatic offices abroad, the last being that of Minister Plenipotentiary at the Court of Brazil. After his return to England, Mr. Christie made two or three unsuccessful attempts again to obtain a seat in Parliament; and contributed in various ways to the literature of the day, his best known work being perhaps the *Life of the First Earl of Shaftesbury*.

A NEW weekly literary paper is about to be issued in London, the first number of which is to appear on the 8th inst. It will be entitled *Journal Général des Beaux Arts et des Arts Industriels*. The special feature of the paper will be its polyglot character, as it is to contain articles on all artistic topics, including music and the drama, in French, English, and German. The editors will be Dr. Le Roy de Sainte-Croix and Herr Sigmund Menkes.

THE *Revue Critique* unmasks what would seem to be an almost unparalleled piece of plagiarism. A *Life of Mahomet* by P. Henry Delaporte, late Consul General of France in the East, which is introduced by the author in his preface as a truly conscientious work, and the result of great research and well-employed opportunities, proves to be a verbal reprint, with the omission of the last twenty-one chapters, of Gagner's famous work, published in 1732. Only the numerous misprints seem to be original.

THE *Temps* announces the death of Charles Asselineau at the age of fifty-three, a bibliographer of some mark. He was the author of a considerable number of *brochures*, among the best known being those entitled *André Bouille, ébéniste de Louis XIV.*; *Notice sur Lazare Bruaudet, peintre*, and *Notes on literary and artistic history*. He also edited some excellent reprints for Techener, and his signature is familiar to the small circle to which the *Bulletin du Bibliophile* addresses itself. Asselineau also wrote some humorous novels, but in all his works the bibliographer is most conspicuous.

A RATHER curious work is promised us from America. Messrs. Scribner, Welford, and Armstrong are to publish shortly *Bibliotheca Diabolica*, a catalogue of works relating to the Devil, "in two parts, pro and con, and serious and humorous; chronologically arranged; with notes, quotations, and proverbs, and a copious index." This, as the *Nation* remarks, can hardly be called dear at 25 cents.

MR. WILLIAM FRASER, of the General Register House, Edinburgh, has just edited, for private circulation, two magnificent volumes entitled *The Lennox*. This work was first undertaken by desire of the late Mr. A. Haldane Oswald, of Auchencruive, and is derived from the Montrose Charters and other family muniments. The biographical portion of the first volume embraces detailed memoirs of the eight earls of the original Lennox line, and of the four succeeding earls of the Stewart line down to Matthew, the twelfth, who is well known as the Regent Lennox, and his eldest son, Lord Henry Darnley, who became King of Scotland on his marriage with Mary, Queen of Scots. The last earl of the original race was Duncan, the eighth earl, who was cruelly executed in the year 1425. In 1572, the earldom of Lennox was conferred upon Lord Charles Stewart, the younger brother of Lord Darnley, whose only child, by his wife Elizabeth Cavendish, sister of the first Earl of Devonshire, was the Lady Arabella Stewart. The dukedom of Lennox was first conferred upon Esme Stewart, Lord of Aubigny in France, who came to Scotland in 1579, on the invitation of the king his cousin, and became a special favourite with him. Charles, the sixth duke, was the last male descendant of Duke Esme, at whose death, during his embassy in Denmark in 1672, the estates were inherited by Charles II. as the nearest collateral heir male. From these brief notes on members of the Lennox family, it is evident that the subject is one of considerable historical interest, and it is almost unnecessary to add that Mr. Fraser does full justice to it. The second volume is of more limited value, consisting chiefly of early charters, writs, &c.; whilst the Appendix contains a few letters and papers relating to Mary Queen of Scots. The work is rendered yet more attractive by some beautifully executed engravings of portraits, facsimiles, &c.

MESSRS. MACMILLAN AND Co. have just issued in a complete form Ferdinand Hiller's *Mendelssohn: Letters and Recollections*, which appeared in the early part of the present year in the columns of their magazine. The original work has already been reviewed in the ACADEMY (see number for May 9), and our readers will remember that it presents a most vivid and interesting picture of the great composer in his relations to a brother-artist. The English translation, by Miss M. E. von Glehn, is on the whole admirably done. Mendelssohn's correspondence is so idiomatic and conversational in style that a too close adherence to the original in translation, however accurately it might give the letter, would certainly fail to reproduce the spirit. Miss von Glehn has therefore very wisely paraphrased somewhat freely, and thereby produced a book as readable in English as the original is in Mendelssohn's charming German. There are, nevertheless, one or two slips which it would be well to correct in a future edition, such as "bride" instead of "intended" as a translation of "Braut," and "whole notes" (which is unintelligible to an English musician) instead of "senibreves" for "ganze Noten." These slips are, however, of rare occurrence, and the work in its English dress deserves, and will doubtless obtain, large popularity.

A FRESH Shakspeare Club has been started at Stratford-on-Avon, by the Mayor, Mr. James Cox, Mr. Bird, Mr. Loggin, and others of the best-known Shakspeareans of the town. The members are in communication with the New Shakspeare Society, and intend to work with it. There is a talk of a new theatre at Stratford, for the acting of Shakspeare's plays. One resident has offered to give his thousand pounds towards the scheme.

As there was no photograph buyable, giving a general view of Shakspeare's birth-town, Stratford-upon-Avon, Mr. Furnivall, on a late visit to the place, picked out the best view of the town, that from Rowley Bank, on the Welcombe Road (which turns at right angles from the Warwick

Road in front of the Roman Catholic Chapel), and got the best local photographer, Mr. Ward, of Ely Street, to photograph it for him. The interest of the view from this point is, that it gives best the nestling of the town under its ranges of circling hills, and so best realises the peace and quiet of the place where Shakspeare ended his days. In the left distance is the range of Meon Hill, with its shoulder slanting sharply to the spire of the church; on the right, the sky-line is continued by the broad back of Broadway, with its monument just seen on the horizon. Under this comes the line of Roomer Hill, and the tops of the elms that ring the churchyard, with a glint of the Avon below; while again under that come the houses of the town, sloping gently to the left, and met there by a fine dark row of trees that shuts the view in on that side. In the foreground is the slope of Rowley Bank, with its cornfields ready for harvest. Though the photograph gives but a poor idea of the quiet beauty of the scene—no green of the trees is there, no blue haze in the hollows, no gold-corn light on Roomer Hill—yet it serves to remind Shakspeare lovers of the picture that must often have given their poet delight. Mr. Ward has a commission to paint the view, and is willing to make duplicates of it and the photograph. Another, and in some respects finer, view of the town is got from the path at the top of Rowley Bank that runs into the Clopton Road. But, though this gives better the grand ranges of hills behind the town, it dwarfs the latter too much, and takes away the quiet nestling look of the town which is such a happy feature of the Welcombe Road view.

THE industrious investigations of Malone into the family of the poet Dryden, established the fact that John's brother, Erasmus, who ultimately succeeded to the baronetcy, kept a grocer's shop in King Street, Westminster. We mention this inasmuch as it may interest some of our readers to know that the signature of "Erasmus Dryden" has been lately observed attached to the foot of a certificate, dated October 15, 1672, now preserved in the Record Office. The matter certified is somewhat curious, so we give it at length:—

"We whose names are hereunder writt'n, Inhabitants in the parish of St Margarets, Westminster, in the county of Midd's, do humbly certifie That we have long known Mr Henry Bulstrode, And that he was divers years an Inhabitant amongst us, all which tyme he lived in very good repute and credit, and without doing any injury to his neighbours, and that he was a constant frequenter of the Church and Divine Service. And that since his remoovall from Westminster, which was about four years ago, we have often seen him, and never observed or heard that he was addicted to Quarrelling. Butt to our apprehensions of a good and peaceable life and conversations, and ready to do friendly curtesies for any Neighbours."

The matter concerning Bulstrode, as appears by another document, was a dispute between him and others about a pew in Petworth Church, which had led to drawn swords, "infamous libels," and all the rest of it—much too lengthy a story to detain us here.

About forty signatures accompany that of Erasmus Dryden; amongst them are also noteworthy—"Will: Owtram D.D.," who was a prebendary of Westminster, and rector of St. Margaret's, author of a work called *De Sacrificiis*; and "Pe: Barwick, M.D.," a fellow of St. John's College, Cambridge, and one of the king's physicians, but whose chief title to fame is that he was one of the very few who remained in the metropolis and pursued the practice of his profession during the ravages of the great plague.

THE *Nation* proposed recently to celebrate the centenary of the independence of the United States, by inducing each State to publish a roll of its men who took part in the war. A correspondent in South Carolina sends that journal a copy of some memoranda made by Jehu Postell, a revolutionary soldier from that State, taken from a notebook in the possession of his descendants. Their

interest is not confined to the victors in the struggle:—

"The following were companions and messmates in the Old Second Continental Regiment of South Carolina infantry, while William Moultrie was Colonel, Francis Marion, Lieutenant-Colonel, and Peter Horry, Major—at Sullivan's Island, S. C., June, 1776.—(Sg.)

Jehu Postell.

"*Alfred Hugér.* 2d Lieut. in Captain Horry's company, 2d regiment S. C. continental regiment—afterwards Captain in same regiment—joined Marion's legion and commissioned Major in 1777. Killed at Stono, near Charleston.

"*William Capers.* 1st Lieutenant in Capt. Horry's Company, 2d regt. S. C. Continental troops, joined Marion and made Captain of the Santee Scouts. Served at Savannah, Fort Moultrie, Eutaw Springs, Rugely Mills, Charleston. As brave a man as ever God let live.

"*George Sinclair Capers.* Private in Horry's Company, 2d S. C. Regt.; joined Marion with his brother, generous, brave, and full of all manner of fun. He could make a royal rum-punch, and as good a swordsman as ever made point or cut.

"*Jehu Sinclair Postell.* Private in Horry's Company, 2d S. C. Regt.; after regiment disbanded in 1776, Jehu joined Capt. Capers' Dragoons with Marion—being my brother, I might say too much of him if I were to give his manly qualities as a gentleman and a soldier. He was the strongest man in Marion's legion.

"*Daniel Eggleston.* Lieut. in Capt. Horry's Company and *Cornet*, afterwards transferred to Hugér's 2d Regt. S. C. troops. When regiment disbanded he joined Colonel Lee, and became Capt. of Cavalry—a fine fellow he was—and *Jehu Postell* who writes this, and has no more to say of himself.

"P.S.—I must not forget the boy *Peter*, whose freedom we give on condition of his faithfulness. He could laugh louder, sleep sounder, and drink more rum than any person I ever saw."

SOME MAGAZINES.

In the *Cornhill Magazine*, an article on "St. Thomas," signed with the initials, "W. G. P.," is of course to be assigned to Mr. Gifford Palgrave, who in the present article is as interesting as he is always instructive. There is a long essay on "Victor Hugo's Romances" which one is not much the wiser for reading. It is eulogistic, naturally, but is none the profounder because it is obscure, and none the more valuable because it is not entertaining. The one thing in it worth remembering is the distinction which the writer draws between the novel written "with a purpose," which constantly overlays and spoils its art, and the novel—such as Hugo's—whose very reason to be is that it expresses an idea. This idea, instead of spoiling the story, is its organising principle: "the essence of the romance." The *Cornhill*, besides thus criticising novels, gives us instalments of three. "Far from the Madding Crowd" has some descriptive passages of power. "A Rose in June"—now drawing towards its close—is a craftswoman's work: the work, possibly it may be thought, of one who is too purely a craftswoman. Last, or first, comes "Three Feathers," or rather its opening chapters. This is the new novel by Mr. William Black, and it is not too soon to say of it that it will be better than his "Adventures of a Phaeton," though much too early yet to make a safe comparison with his "Princess of Thule." Mr. Black's style, as the new chapters show, is still graceful and easy, rather than powerful and nervous. There are several living novelists, therefore, who can match his work in details, and only two or three who can match it as a whole. Already the characters of the new book are real and living. There grows up gradually about his pages the reality of natural scenes, and something more than their charm. Certainly Mr. Roscorla is wearisomely hopeless and tiresomely reasonable, and Morwenna, the plain little heroine, almost tiresomely angelic; yet, somehow, one believes in them. Of the pretty and petulant Mabyn, the

spoiled beauty of the Cornish coast, more is of course to be made hereafter. Harry Trelyon will be liked; for so was Harry Esmond. But what is best in the first chapters is the singular ease and imperceptible charm which unconsciously persuade one of their truthfulness. If Mr. Black ever gained this ease without infinite labour he is a fortunate man. Read this account of the plain little heroine when middle-aged Mr. Roscorla has proposed to her, and she has unwittingly offended the glorious youth, Harry Trelyon:—

"So she went away, and passed round to the other side of the rocks, and came in view of the small winding harbour, and the mill, and the inn. Far away up there, over the cliffs, were the downs on which she had met Harry Trelyon that summer morning, as he rode by, singing in the mere joyousness of youth, and happy and pleased with all the world. She could hear the song he was singing then; she could see the sunlight that was shining on his face. It appeared to her to be long ago. This girl was but eighteen years of age, and yet, as she walked down towards Eglosilyan, there was a weight on her heart that seemed to tell her she was growing old. And now the western sky was red with the sunset, and the rich light burned along the crests of the hills, on the golden furze, the purple heather, and the deep-coloured rocks. The world seemed all ablaze up there; but down here, as she went by the harbour and crossed over the bridge by the mill, Eglosilyan lay pale and grey in the hollow, and even the great black wheel was silent."

In the *Fortnightly*, Mr. George Meredith begins a story ("Beauchamp's Career") not wholly unpolitical. The editor concludes his thoughtful essay on Compromise; Professor Cairnes reviews "The English in Ireland;" and Mr. Swinburne gives us a lyric, "The Year of the Rose," in which, if there is not superabundant thought, there is at least abundant melody. As witness these last lines:—

"The time of lovers is brief:

From the fair first joy to the grief

That tells when love is grown old,

From the wild warm kiss to the cold,

From the red to the white rose leaf,

They have but a season to seem

As rose-leaves lost on a stream

That part not and pass not apart

As a spirit from dream to dream,

As a sorrow from heart to heart.

From the bloom and the gloom that encloses

The death-bed of love where he dozes

Till a relic be left not of sand

To the hour-glass that breaks in his hand,—

From the change in the grey garden closes

To the last stray grass of the strand,

A rain and ruin of roses

Over the red-rose land."

In *Fraser's Magazine* there is a long review of Mr. Motley's *John of Barneveldt*, signed by Alexander Falconer, who follows in some detail the career of Mr. Motley's hero. The article is perhaps even more of a summary than a criticism. The question of the London Hospitals is not to be allowed to drop, and a writer in this magazine extends the chronicle of abuses, and gives us more "samples of the amount of work that may be done in a day." Having fully persuaded his readers of that of which all newspaper readers are, we suppose, persuaded beforehand, the writer of the article comes to his remedy. "The simplest, as well as the most efficient plan," he says, "as far as hospitals are concerned, seems to be to separate entirely the hospital and its administration from what is really the dispensary attached to it, i.e., the out-patient department; and in order to prepare for the enforcement of this by-law, if necessary, it would not be difficult to lay before a Royal Commission, or Parliamentary Committee of Enquiry, abundant evidence to show that such a change would be greatly to the advantage of all the patients, of the medical profession, and of the public." Mr. E. W. Godwin discourses on another well-worn theme, "The

Decoration of St. Paul's." He treats it, however, with some freshness of style, and has perhaps a claim to be heard, if only on the ground that much of what has heretofore been written about it has been written by architects not of the school of Mr. Burges, but most of whose opinions have none the less been entitled to great weight.

THE *Gentleman's Magazine* contains two contributions of some interest. The first is a light poem by Mr. Robert Buchanan. It is called "Love in Winter," and sings the praise of the tranquil love that is made by the aged, whom passion has left. The second is called "Waterside Sketches," but might more reasonably have been called "The Ouse and the Trent." It is written by an angler, who has all an angler's affectionate recollection for the haunts he has frequented; but this angler has read Cowper, and Drayton besides, and though he is garrulous and diffuse, he does succeed now and then in suggesting a quiet homely picture of the scenes for which he cares.

Tinsley's Magazine contains the usual quantity of light matter in prose and verse. "Jessie Trim," the principal novel, is by Mr. B. L. Farjeon, whose studies of the lower class and lower middle-class, a little in the manner of Dickens, have before now attracted notice.

NOTES OF TRAVEL.

WE hear that the post of British Minister at Washington has been offered to Sir Seymour Fitzgerald, G.O.S.I.

THE *Journal de St. Pétersbourg* of July 15 contains an extract from the *Messenger Officiel* to the effect that the Governor of Astrakhan is being continually interrogated by merchants of that province as to the safety, &c., &c., of the commercial route between Krasnovodsk and Khiva. The Governor, after obtaining all the information possible, advised the merchants that the route to Khiva by the Fort of Alexandrovsky is safer than that by Krasnovodsk, but that the latter is much the shorter of the two and by far the most frequented by caravans, of which two had arrived safely at Khiva from Krasnovodsk, and were shortly expected to return. The Governor added that it was proposed to despatch a large caravan from Krasnovodsk in August, which would accompany a scientific expedition. The friendly feelings which are increasing between the Russians and the nomads tend to make this route day by day more safe.

THE *Invalide Russe* gives the following particulars concerning the Russian expedition to the Amou-Daria. Part of the expedition, with Colonel Stoletow, the chief, left Petersburg at the end of April, and the remainder some time later. The reunion of the whole took place at Kagalinsk on June 1, where they employed the time of detention in preparations for the journey and testing the instruments, &c., &c. The expedition left Kagalinsk in the beginning of June on board the steamer *Perovsky* for the delta of the Amou-Daria.

THE *Homeward Mail* states, on the authority of intelligence received at Lahore, that an express from Yarkund has been received at Leh, announcing that the members of the Mission have finally settled upon their plans. They left Yarkund on May 18, and were to leave Kargalik on the 23rd. It is expected that they would have reached Mangi, the second stage on the Karakorum side of the Sassu Pass, on June 9, and possibly arrive at Leh on June 20. The party is accompanied by a Panj Sa Bashi, who has been deputed by the Ameer to accompany it to Ladakh, and another officer has been directed to arrange for their travelling by the Kugiar route. Sayyid Yakub Khan Tara will shortly visit India again, after he has made over to the Ameer the presents which he has brought from the Porte.

THE Commission appointed to select the most fitting spot for the establishment of a commercial port on the north-east shore of the Black Sea has decided on the Bay of Helendjeck.

PART I. of the *Cosmos* of 1874, published by Signor Cora, at Turin, contains a short review of the numerous travels which have of late been made in New Guinea and the adjacent islands. A letter has been received from Beccari, who announces his intention of starting from Macassar for Kandari, which is situated in the south-east peninsula of Celebes. From thence, as appears from subsequent letters, he will repair to New Guinea, and explore the little known and extensive bay of Geelvink and its surroundings. In accordance with a suggestion of Beccari's old friend, the Marchese Doria, the municipal council of Genoa have voted a sum of 15,000 lire towards the expenses of the projected journey. Beccari met at Makassar the Russian ethnologist Mikluchov-Maklay, who, in spite of bad health, was also meditating a return to New Guinea, in the vicinity of Triton Bay. It appears that in the latter part of November, 1872, a shocking massacre of eighteen sailors belonging to the crew of the German brigantine *Franz*, took place near MacClure Inlet, where the ship was cruising in search of pearls. The party had been enticed ashore by friendly advances on the part of the natives and presents of fruit, and no watch having been posted, the treacherous aborigines had no difficulty in surprising and murdering the whole party while asleep. The most recent news connected with the island is that the Dutch Government is turning its attention to New Guinea, and that an official topographer, M. Struick, has been commissioned to construct a large-scale map of New Guinea, which is now on the eve of publication; a reduced copy of this map will shortly appear in the Bulletin of the Geographical Society of Amsterdam. The projected expedition, consisting of two war steamers, which was to make a complete circuit of the island, has been put off, for the present year at least, owing to the war in Acheen.

Another feature of note in Signor Cora's periodical is a carefully compiled and executed map of the gold-bearing region between the Limpopo and Zambesi, in which map the accomplished and indefatigable gentleman who unites in his person the functions of editor, cartographer, and proprietor, has embodied the work of Carl Mauch (1867-1871), S. Baines and his companions (1869-1870), Captain Elton in 1870, Erskine, the Livingstones, and some names of minor note. We must not omit to notice another important characteristic in the periodical, which is a section devoted to short reviews of prominent Italian works, the existence of which is rarely known so well in this country as, in many cases, the works deserve. Among these may be mentioned the first volume of a remarkably complete gazetteer, which is designed to give the fullest available information about every place of consequence, and a comprehensive biographical history of Italian explorers and travellers from the thirteenth century down to modern times, a work of some value in spite of a few errors. The first-named work is by Professor Enrico Caporali, and the second, entitled *Storia dei Viaggiatori Italiani*, is a posthumous work by the late Gaetano Branca.

The remainder of Signor Cora's *Cosmos* is taken up with notes of events which have already been chronicled in our columns, and minor miscellaneous matter.

THE *Sydney Mail* gives some interesting details respecting various rare specimens of the Bird of Paradise, which M. d'Albertis, in his recent visit to the Arfak mountains, in the north-west of New Guinea, managed to secure. In his first excursion in the neighbourhood of Atam (3,500 feet above the sea), he shot a fine *Parodia serpens*, a species of which Wallace was only able to obtain one damaged specimen. In observing the habits of these birds he never once saw the male in com-

pany with the female, but always hiding in the thickest parts of the forest. The bird's usual food is figs and other fruits, and its method of cleaning its plumage is to clear a circular space in the earth of leaves and twigs, and then to roll itself in the dust, as fowls do here. After this it utters its peculiar cry and shakes its feathers. On the following day D'Albertis shot a specimen of the *Lophorina atra*, a wonderfully small black bird, which Wallace and Allen were informed was only to be met with some distance inland. Wallace, indeed, arrived at the conclusion that the natives watched jealously over every specimen, for fear of its becoming extinct. Their chief beauty lies in the bright velvet-like feathers which start from below the occiput, and which the bird expands at will, so as to cover itself. Although M. d'Albertis did not remain long in the Arfak mountains, he succeeded in collecting 122 birds, a great portion of which are quite new. Two unique specimens are destined for our own Zoological Gardens.

PETERMANN'S *Mittheilungen* for July contains a long and exhaustive paper by Dr. Joseph Chavanne, of Vienna, in which the author endeavours to prove, chiefly from arguments based on meteorological data, the dimensions and extent of the still undiscovered Arctic Lands. The main argument he makes use of is, that unless local considerations come into play, winds of excessive cold in winter and heat in summer are a sure indication that they blow from the interior of some continent, and that winds of a more moderate temperature both in winter and summer betoken the existence of sea in their rear. From a detailed consideration of all phenomena as observed by a long line of Arctic explorers, from the time of the Dutchman Barents, in the sixteenth century, down to the present time, he arrives at the conclusion that the unknown region consists of a broad strip of land cut up by fiords, or deep indentations, lying right across the North Pole, and forming a direct northerly continuation of Greenland as far as 83° or 84° N. latitude, from whence it stretches in a north-easterly direction. The coast line of this mass of land will probably be found to lie on the one side between 25° and 170° E. longitude, and from 84° to 85° N. latitude; and on the other, between 90° and 170° W. longitude, and 80° to 86° N. latitude. Northwards of Robeson Channel the land to the west will be found to trend sharply round to the west, and thus Smith Sound and Behrings Straits are in direct communication, and the drift wood found on the shores of the former is accounted for by the fact of its being brought thither by the warm Kurosiwo or eastern current of Japan. Under the influence of the northern arms of the Gulf Stream, which flow westward of Spitzbergen and between it and Novaya Zemlya and the Kurosiwo, the sea on either side of the Arctic continent is washed by warm streams, and is thus partially free from ice, and navigable for some portion of the year at all events. Thus, the sea between Spitzbergen and Novaya Zemlya as far as Behring's Straits is navigable in summer and autumn, and the best routes for polar exploration are, therefore, in those two directions.

These conclusions agree very closely with the theories which Dr. Petermann has at all times advocated, and of which the existence of an open Polar Sea is a conspicuous feature. In fact, it may be observed that the arguments here used agree so closely, even in point of language, with those of the able editor, that it may not unfairly be assumed that the article now before us is a joint production.

A selection of extracts from the narratives of individual members of the crew of the *Polaris* (accounts which have been already made known to English readers through the pages of the *Geographical Magazine*) forms a companion article to the above; and the number winds up with a note on Dr. Nachtigal's recent important journey from Wadar, in Central Africa, to Dar-Fur, a journey the particulars of which have not yet

come to hand, but which promises to prove of the utmost importance, inasmuch as it joins on to Schweinfurth's work in Central Africa, and so supplies a missing link in the exploration of the great continent from west to east.

THE *Straits Times* (of Singapore) has received news by telegram from Port Darwin, the northern settlement of South Australia, that an assay of ten tons of quartz crushed there had resulted in a yield of 771 ounces of gold. This gives a money return of more than 250*l.* per ton. The importance of this can best be realised by taking into account that Victorian companies find that it pays to work reefs where the crushed quartz yields only five pennyweights, or gold to the value of about 1*l.* per ton. The geographical position of Port Darwin, as well as that of the other settlements in the north of Australia, is very favourable to its future trade with Singapore, and it is thought that it will be to their advantage to make this place their *entrepôt*.

ONE of the members of the scientific expedition of the Amou-Daria writes from Tchimbai, a commercial town in the oasis of Khiva:—

"The population of Tchimbai seems to be of a pacific character, but it cannot be entirely trusted, as it is not yet accustomed to the sight of the Russians. The delta of the Amou has served for two centuries as the rendezvous of all lovers of the wandering life. It is the centre where all the malcontents of Bokhara, Khiva, Kazalinsk, and Perovsk join, and emigrants from Samarcand may be met there. The chief nucleus of the population of Tchimbai is composed of Karakalpaks, who are horribly afraid of the Turcomans. The number of tents of Karakalpaks on our bank alone is about 10,000, but it must in reality be much larger.

"The districts between Oulkoun-Daria and the Taldyk (Western branch of the Amou), very extensive and still wholly unexplored, serve as a camping-ground for a great number of these semi-nomads.

"In the Russian Amou-Daria territory all is peaceable. Unfortunately the same cannot be said of the Turcomans established on the left bank. The Tekiens likewise continue their depredations on the road from Schourakhan to Bokhara, and have recently pillaged a caravan. The delta of the Amou-Daria is an immense sheet of water, very different from the other parts of Turkestan. The Karakalpaks are generally as good boatmen as daring riders. There is a considerable trade in fish. A sturgeon weighing two pounds costs 40 copeks, and even this price has only been reached since the appearance of the Russians."

THE *Temps* states that two French travellers have just returned to Paris from an excursion into "the heart of Africa." After a stay of eight months at Gabon, which they spent in learning the language of the country, and making the acquaintance of the gorilla, whose character they represent as cruelly libelled by M. du Chailu, they started into the interior. Their chief enemy was the climate, the natives being always easily pacified with a little *eau-de-vie*. Several tribes and their sovereigns gave the travellers a cordial reception, among the latter being N'Combe, King of the Gallois, who became their fast friend on receiving a daily ration of raw alcohol. Unhappily, this monarch, who had cleared his way to the throne by poisoning his whole family, was poisoned himself during the travellers' stay at his Court. A blind king of the tribe of the Inengas then guided them to the Okanda territory, where they found a new escort. They now looked forward to reaching without much difficulty the great lakes discovered by Livingstone, when they were attacked by the Osybas, a warlike tribe of the Pabouin family, who killed some of their party and forced the rest to retreat. They returned to Gabon last May, in an exhausted condition. The chief result of their expedition is the discovery of the great river Ivindo, which, according to the negroes, is the real way of communication with the great lakes. It was at the confluence of the Ivindo with the Ogooué that they were forced by the attack of the Osybas to retrace their steps.

TRAVELLING in the States would seem to offer many attractions at present to those in search of adventures. The *Nation* thus summarises the present state of affairs in the West:—

"The news from the Plains is full of rumours of an Indian rising, and outrages of greater or less gravity are reported all the way from Pembina in the north down to the frontier of Mexico. The army is too small to display much activity over so wide an area, and General Sherman jokes grimly over the Indian policy of the Department of the Interior, which, he says, sends the warriors and ponies fat and sleek in spring to ravage the frontier, and receives them back in the fall like returned prodigals. The testimony of all respectable white men who have lived on the Plains is, however, that the Indians are more sinned against than sinning, and that their risings usually have behind them a solid support of cheating and cruelty. They are swindled by the contractors out of their lawful subsidies, and they are roused into quitting their reservations by the fact that they are constantly being shifted from good land to worse, in compliance with the intrigues of knavish land speculators at the Department of the Interior. Probably nothing could happen at this moment that would seal up such a fountain of white iniquity so well as the death of the last Indian."

THE *Scientific American* states that near Omaha, forty miles north of the Pacific Union Railway, extensive natural deposits of carbonate of soda, the richest known, have been discovered, an event of the greatest importance to America, which imports yearly 118,000 tons, of the value of about fifty dollars per ton, for its various manufactures of soap, glass, and other articles of large consumption.

TONSON'S CORRESPONDENCE.

AMONG additions of late years to the Manuscript department of the British Museum which have attracted little or no attention, is a volume of original letters addressed to Jacob Tonson, the celebrated bookseller, which should most assuredly not be overlooked when the next history of last century literature is undertaken. In turning over the volume, we meet with many old familiar names of the Queen Anne period—autographs of Pope, Steele, Hughes, Tickell, Nicholas Rowe, Laurence Echard, the historian, and several others of greater or less note. One very remarkable letter in the collection is from John Oldmixon, the abusive historian of the Stuarts, whose name would have small chance of immortality but for the ridicule he undergoes in the *Tatler* under the name of Mr. Omicron, "the unborn poet," and his imaginary contest for the prize of dulness, in the second book of the *Dunciad*. Chalmers says of him, that "to the disgrace of the statesmen of that time, his zeal as a virulent party writer procured him the place of collector of the Customs at the port of Bridgewater." This letter, however, which we transcribe at length, does not display much appreciation of the favours extended to him:—

"Sr

"If you ever had compassion for a man most unjustly suffering for his zeal for a Cause you always espoused which I shall most amply make appear when I come to London.

If my particular attachment to your interest & the Pleasure I took in serving you.

If the Desire I feel to return to town & evidence by Deeds what I can only now do by words can prevail upon a generous mind I flatter myself you will be so kind as to speak to my L^d D. of Newcastle that I may succeed Mr. Rowe in the Laureat's place which I was to have had before, had it not been for him, as Sr Samuel Garth knows. My Lord will be spoken to by several illustrious Persons, but I know, Sir, your Opinion & Recommendation in this case will have as much weight as any Bodies of the Kingdom. Surrounded with Jacobites, vilified, insulted & having not a minute's ease my Friends will not endeavour this fatal absence of mine may not be to my Ruin. What a figure would a laboured translation of Ariosto make with the Laureat's name before it. And tho' yourself may not embark much farther in under-

takings, yet probably your Family may, to whom as I am already much obliged so I should always remember so infinite an obligation as your Friendship in this case. No body will appear that has my Pretences. If some of em have done more for the Muses, which I question, I will prove that I have done more than all of them for the Crown. Besides I am the eldest Claimer. Long have I been in the service of the Muse and the Press without any Reward, & the life I lead here is not worth living.

Dear Sr

Let me beg you to mind me this time. You know how to do it better than I can tell you. Mr Tickell is above it, Mr Hughes has 500*l*. a year places. So they all have, I think. I cannot tell what other younger writer will appear, I suppose Mr Dennis is a competitor; & then if my friends will be friends, I see no reason to despair of carrying it, which will make me as happy as I now think myself miserable. My very hearty well wishes to Mr Tonson for whom I am preparing a long letter & am with sincerity & respect

Sr

Your most obligd humble serv^t

JN^o OLDMIXON.

Cust. Off^r Bridgewater

13 Dec^r 1718

To Mr Jacob Tonson Sen^r

"Shakespears Head

In the Strand

over agst Katherine Street

London."

A recent examination of the records of the corporation of Bridgewater brought to light an "information," dated July 2, 1718, by the sexton and parish clerk, to the effect that John Oldmixon and others had "applied themselves to and frequented the Presbyterian and Anabaptist Conventicles; till of late they are thence withdrawn, and come to the service of the Church of England" (see Third Report of Historical MSS. Commission).

The following letter of Rowe is of small moment, unless as exhibiting the distinguished patronage which supported him:—

"Mr Tonson

Aug. 1st 1716.

"I have herewith sent you All but the last sheet of the Fourth Book w^{ch} I shall carry into the country with me for a week in order to some corrections I am to make in it. I desire you will send me Fifteen guineas on account by the Bearer. I desire you will send to Lord Warwick for the third & Lord Hervey at Lord Bristol's in St James's Square for the second Book, and that you would call on Mr Molyneux or at least leave word with his clerk Mr Ekersall to desire he would speak to the Princess that she may be pleased to send back the First if she have done with it. I intend to get the Fifth finished by Michaelmas & do believe We may then think of beginning with the Press.

I am

"Your humble servant,

"N. Rowe."

Steele's letter, written very shortly after Addison's death, shows too clearly the estrangement between the two former friends.

"Mr Tonson.

Sr

I apprehend certain Persons desire to separate the works of Mr Addison from mine in a Book called the *Tatler*. Be pleased to observe that I insist I payd Mr Addison for what he writ under that title, and made a Title of the whole to Hutt (?) and as there is a remainder according to act of Parliament in writings to authors of which my Family shall not be bereft, Mr Addison is the last man who shall be patiently suffered in doing unreasonable things (that he has, you must know) to

Sr

Y^r most humble Serv^t

RICHARD STEELE.

Jul: 19 1719

I expect some Fish very soon in town of which I desire you to accept a Present."

About half a dozen letters of Pope are also preserved in this collection, and as they find no place in Mr. Elwin's elaborate edition of Pope's correspondence, we shall perhaps be excused for quoting one and part of another.

"Twittenham, Wednesday.

"Sr

"My ill fortune so ordered it, that I had three people who came & took possession of all y^r Beds in my house last week. I sent to acquaint you with it, depending otherwise upon y^r promise of passing a night or so here. Since that time my affairs have hurried me to & from London, interchangeably every day; the last part of the Planting season taking me up here & business which I think less agreeable, there. I'm resolved to pass y^r next whole week in London, purposely to get together Parties of my acquaintance every night, to collate y^r several Editions of Shakespear's single Plays, 5 of which I have engaged to this design. You shall then hear of me: till when too, I'm forced (much ag^t my inclination) to put off our meeting at Mr. Carpenter's. I wish you'd inform Sir Godfrey how busy I have been. I think it three Ages since I saw him, & if my Features are altered, in proportion to the length of Time which it has seemed to me since I saw him, my Picture at next sitting will be as old as Nestor. So tell him, & tell yourself that I am, Sir.

"Your very humble servant,
"A. POPE."

Writing from "Oxford, Sept. 3" (1721), he says:—

"I have a favour to ask of you, that if (as I'm told) poor Mr. Craggs's Library comes into your hands to be disposed of, you will lay your hands upon an odd Volume of Barrow's Sermons, which I lent him a week before he dyed, y^r loss of which will spoil me a whole sett. You'll easily know it, for he had no other; it is bound in a cover with a Table in it, y^r leaves sprinkl'd with red & green."

T. Tickell writes by order of Mr. Addison to tell Tonson that Mr. Craggs's designs to appoint him Stationer to the War Office, if he (Craggs) be made Secretary at War, and wishes him joy.

CORRESPONDENCE.

AMERICAN PROFESSORSHIPS FOR EUROPEAN MEN OF SCIENCE.

2, North Road, Clapham Park.

There are some circumstances connected with this subject, commonly overlooked, which impressed themselves strongly on my mind during my late visit to America. I may remark that the informal and exceedingly pleasant relations into

which I was privileged to enter with American men of science and culture, gave me excellent opportunities for forming an opinion,—far better, for instance, than did the public receptions to which I was kindly invited. Coming also as one who had studiously avoided entering into official, and associational relations in Europe, I probably found Americans readier to speak plainly than otherwise might have been the case. Be this as it may, at all the chief centres of scientific culture in America, whether in New England or the Middle States, or (as far west as I journeyed) at St. Louis, Chicago, Cincinnati, or Columbus, I found a general uniformity in the expression of feeling respecting the importation (so to speak) of European men of science.

In the first place it is to be noted that at the college of his adoption, a European scientist* not only meets with a warm welcome, and that generous hospitality in which, as I think, America surpasses all other nations, but is regarded with a certain pride as one among the distinctions of the college. In the case of Agassiz, for example, I could not but recognise the existence of this feeling, not only at Harvard and in Boston, but throughout Massachusetts. Doubtless much of this was due to the singularly genial nature of the man; but the local feeling was there also, and strongly marked. No farther away than Connecticut, a difference of tone was clearly perceptible. Such local feeling, or affection for some special institution, calls also into full play the munificence of associations of individuals. A remarkable instance presented itself in my own experience. In one case where I was invited to accept a professorship, the offer was made to erect an observatory at a cost which would have permitted of the employment of a principal telescope as large as that at Washington (26 inches aperture). In all departments of science similar munificence is manifested.

But secondly, it is not to be overlooked that elsewhere than at the college of adoption, the introduction of European professors to offices of chief emolument is regarded with a very natural (nay, commendable) jealousy, especially among those best able to weigh the merits of American science. It is only among the less well-informed Americans that the qualities of American leaders in scientific research—their energy, ingenuity, and originality—are undervalued, and this only because shortcomings are imagined which have no real existence. The Americans who are best able to judge, know that the elaborateness of European scientific training is less effective than their own more practical system; and they consider it unfair that the claims of their best men should be overlooked in favour of strangers.

It should be noted, thirdly, that the possibility of their outbidding Europe in the offer of professorships, or of the means of scientific research, is regarded by Americans as involving a deep disgrace to the Old World.

One European peculiarity Americans fail to understand, I think. Europeans who accept American scientific offices are practically forgotten in Europe in a few years. This leads Americans to imagine (as I heard said several times even about Agassiz) that before going to America such Europeans were "played out" in the Old World.

RICHARD A. PROCTOR.

EDMUND SPENSER.

Norton Canon: July 18, 1874.

Having suggested that the will of Dr. John Spenser (the coadjutor of Hooker) should be examined in the hope that it might contain some reference to his schoolmate and namesake, the poet, I now subjoin an abstract of its contents, which the courtesy of Colonel Chester has placed at my disposal. The will is dated March 25, 1613, and was proved in London June 9, 1614.

* Unfortunately convenient word.

The testator describes himself as vicar of St. Sepulchre's, London, and disposes of landed property in Kent and Essex. He mentions his wife Dorothy, sister of Thomas Cranmer, and his sons John and Thomas (under age); his wife's kinswoman, Elizabeth Seller, and his servant Christopher Spenser. There is no allusion to the poet, nor any clue to the testator's paternity or place of birth. Thus far, therefore, the search has been unavailing; but I hope soon to obtain access to a list of Mulcaster's pupils at Merchant Taylor's which was certainly in existence sixty years ago.

C. J. ROBINSON.

ENGLISH ETYMOLOGY.

1 Cintra Terrace, Cambridge: July 24, 1874.

In an article in the *Spectator*, July 18, 1874, p. 921, a writer is pleased to "derive" the word *atone* from the substantive *tone*! I wish to record my indignant protest against the common practice of making our noble language a "vile body," for every apprentice hand to try experiments upon. A glance at Richardson's *Dictionary*, or at Mr. Aldis Wright's *Bible Wordbook*, would have shown at once that the guess was wrong. Has then our language no history? Have we no old records in which we may search? And why should it be meritorious to vent ridiculous guesses upon the subject of *English* etymology, whilst in Latin and Greek even a false quantity is rightly ridiculed? I fear it is because boys are really taught Greek and Latin at school, but English they must pick up as they can, so that many amongst us are so left to themselves, that they do not even know that they do not know English etymology. Surely it is nearly time for this disgraceful state of things to cease, and that those who do not care to investigate such matters should have the decency to keep silence. But oh! that English may be taught at all our schools!

WALTER W. SKEAT.

A PASSAGE IN MACBETH.

A line spoken by Donalbain, one of King Duncan's sons, after his father's murder by Macbeth, seems to me to have been misinterpreted hitherto. It occurs in II. iii. 134–40, p. 138, col. 2, rep. Booth:—

"Malcolm. . . . He to England.

Donalbain. To Ireland, I.

Our separated fortune shall keep us both the safer;

Where we are, there's Daggers in men's Smiles;

The neerer in blood, the neerer bloody.

Malc. This murderous Shaft that's shot,

Hath not yet lighted: and our safest way,

Is to avoid the ayne. Therefore to Horse." . . .

Stevens, whom Clark and Wright (Clarendon Press ed., p. 114), follow, explain the italic line as expressing Donalbain's suspicion of Macbeth, the cousin of Duncan. It seems quite plain to me that Donalbain means, "The (neerer =) nigher in blood we are to Duncan, the nearer we are to our own deaths. If we stay here, our murder is certain." Malcolm agrees with him; and away they go.

The following extract from Holinshed's Chronicle, which was Shakspeare's original, confirms my interpretation:—

"Malcolme Cammore and Donald Bane, the sonnnes of king Duncane, for feare of theyr liues (*whiche they might well know y^e Makheth would seeke to bring to end*, for his more confirmacion in the astate) fled into Cumberland."

F. J. FURNIVALL.

THE first prize in the competition for the Church of the Sacred Heart at Montmartre has been awarded to M. Abadie; the second to MM. Davidon and Lameire; and the third to M. Antoine Cazaux.

SCIENCE.

The Ancient Stone Implements, Weapons, and Ornaments of Great Britain. By John Evans, F.R.S., F.S.A., Honorary Secretary of the Geological and Numismatic Societies of London, &c., &c. (London: Longmans & Co., 1872.)

(First Notice.)

THE publication of this work marks a distinct advance in English archaeology. The stone antiquities of Denmark have been systematised by Worsaae,* and splendidly illustrated by Madsen.† The principal types of Central Germany have been illustrated by Lindenschmidt.‡ Sir William Wilde has described the extensive series in the collection of the Irish Academy,§ and those of Scotland|| have received attention from Dr. Daniel Wilson. But this work is the first that has aimed at presenting in a plain and popular form a complete and systematic account of the Stone Implements, Weapons, and Ornaments of the British Isles, the methods of their manufacture, their uses and analogies, the topographical distribution and chronological sequence of types, so far as that has been ascertained, and their association in sepulchral, or casual, or natural deposits with other relics of ancient handicraft. It is, as might have been expected from the well-known ability and speciality of its author, by far the ablest and most exhaustive exposition of a somewhat obscure subject that has yet appeared.

In his introductory chapter, Mr. Evans remarks that there is still much misconception abroad regarding the classification of the antiquities of Western Europe first practically adopted by the Danish antiquaries under periods known as the Stone, Bronze, and Iron Ages—a division of unrecorded times of which, however, they were not the inventors, but which had been used before the Emperor Augustus embellished his country-seat with the first archaeological and geological collection on record. The idea of the succession, briefly stated, is this: There was a period in each given part of Western Europe when the use of metals was unknown, and men had to depend on stone and other readily accessible natural materials for their implements and weapons of the chase or war. This period was succeeded by one in which the use of bronze gradually superseded stone for certain purposes, though it remained for others; and finally a time arrived when bronze in its turn gave way to iron or steel, as being a superior metal for all cutting purposes. But such a classification as this, says Mr. Evans, in no way implies any exact chronology, far less one that would be applicable to all the countries of Western Europe alike. It is rather to be regarded as significant only of a succession of different stages of civilisation. When

* *Nordiske Oldsager i det Kongelige Museum i Kjöbenhavn.* (1859.)

† *Afbildninger af Danske Oldsager og Mindesmærker: Steinalderen.* (Copenhagen: 1869.)

‡ *Die Alterthümer unserer Heidenischen Vorzeit, &c.* (Mainz, 1858–1870.)

§ *Descriptive Catalogue of the Antiquities, &c., in the Museum of the Royal Irish Academy.* (Dublin: 1857.)

|| *Prehistoric Annals of Scotland.* (London, 1862.)

Italy, for instance, may have entered into its Iron Age, some of the more northern countries may have been in their Age of Bronze, and others still in their Age of Stone. Neither does it imply that stone implements had ceased to be used in the Bronze Age, nor that in the Iron Age both bronze and stone had been entirely superseded.

"Like the three principal colours of the rainbow, these three stages of civilisation overlap, intermingle and shade off, the one into the other, and yet their succession, so far as Western Europe is concerned, appears to be equally well defined with that of the prismatic colours, though the proportions of the spectrum may vary in different countries."

But however satisfactory this hypothetical succession of the ages may seem, it does not by any means follow that its "practical application" to a collection of antiquities, by dividing them, as in Denmark, into three great groups of stone, bronze, and iron implements, corresponding to the three periods, will produce equally satisfactory results. On the contrary, it is evident that the amount of confusion and anachronism thus produced will be precisely in proportion to the confidence with which the theory is "practically applied." Unless we are able to distinguish between stone implements of the Stone Age, and stone implements of the other ages, the mere grouping together of implements of similar forms and of the same material adds nothing to our knowledge concerning them, or to our interest in them as the expressions of a human purpose, while it suggests the essentially false idea of the contemporaneity of the different members of the separate groups. But if we could separate the stone implements that were in use in the Bronze Age from those that were used in the Iron Age, and both from the implements of the purely stone period, each group would then possess a distinct value and interest, as connected with the progressive influence of advancing civilisation. Partly, however, in consequence of the confidence with which the theory of the Three Ages has been "practically applied" to most of the great national collections, and partly from the want of systematised knowledge of the chronological relations of the objects themselves (a defect which Mr. Evans's book will go far to remedy), this separation is not yet practically attainable. Another source of the popular misapprehension of the subject lies in the general misconception of what is really implied in such a classification. It is evident that it can only hold good for the styles or forms, and that it can give us no clue whatever to the chronological relations of the individual specimens, which must be fixed (if fixed at all) by circumstances of association. Hence the incalculable value, for the correlation of the various implements, of carefully detailed descriptions and authentic observations of "finds" made in barrows, and other ancient deposits, in which the association of the objects is one of true contemporaneity, and not of fortuitous juxtaposition. This difficulty of classification is clearly realised and fully admitted by Mr. Evans, when he remarks that, "with some exceptions, it is nearly impossible to say whether an ancient object

made of stone can be assigned with absolute certainty to the stone period or no." And this difficulty meets us in an aggravated form when we are asked to subdivide the stone period into the Palaeolithic and Neolithic Ages on the hypothesis that there was an era far on in the Stone Age when implements, which had been previously only chipped into shape, began to be finished by grinding and polishing of their surfaces. This hypothesis may be true, or it may not, but the impossibility of reducing it to practice in the classification of a series of specimens, is at once demonstrated by the facts that every implement which is of the so-called Neolithic type, was of Palaeolithic type at one stage of its manufacture, and that there were certain forms both of the earlier and later Stone periods which were never ground or polished at all. Thus the rudest form of a flint implement may be merely the initial stage of its individual progress towards the completion of its manufacture, instead of the far-off beginning of a series of types progressing through long ages to a similar perfection. The remains of the fauna with which these rude implements are associated furnish us with a certain clue to their classification; but until we obtain a greatly more extended and precise knowledge of the correlation of the natural deposits in which they occur, and of the relative antiquity of the different species of the *faune naturae* of the British Isles, it would be rash to dogmatise upon the subject. In truth, we misconceive entirely the basis on which the whole question rests, when we forget the fact that we have no positive evidence of an ancient Stone Age at all. It is a mere inference founded on the want of evidence of the use of metals, and had we not the analogy of modern savage life to justify the supposition, we might hesitate to conclude that there ever was a time when mankind were wholly ignorant of metals. But we have positive evidence of the most abundant and conclusive kind that there was a stage in the gradual progress towards the present civilisation of Europe, when men did make use of implements of stone for most of the purposes for which we now use instruments of metal; and the natural conclusion is that this universal use of an inferior material was due to the scarcity, if not to the actual destitution, of materials so much more suitable.

The abundance of these ancient implements fabricated chiefly in flint implies a facility of manufacture which must have been the result of a system founded on accurate knowledge of the qualities of the material, and long experience in the working of it. The problem which Mr. Evans set himself to solve was the re-discovery of this ancient art. Two sources of information were open to him. One was the critical examination of the implements themselves, and of the refuse cores, flakes, and chips from the sites of ancient "flint factories," presenting evidences of the workman's processes. The other was a comparison of these with the results obtained by the flint-workers of the present day in England or among the savage races who still manufacture their tools and weapons of stone. Ascertaining

by experiment that the results obtained by blows with such rounded pebbles or "hammer-stones" as are constantly found in ancient "flint-factories" are indistinguishable from those produced by a modern steel-faced hammer, and studying the effect of blows differently delivered upon the block to be worked, he was able to demonstrate the processes employed in the fabrication of the different varieties of implements anciently used in Great Britain. The chapter thus devoted to their methods of manufacture is not the least interesting and valuable in the volume, setting forth in the results of so much careful observation, patient experiment, and rigid induction, the whole mystery of an art which must have been at an early stage of our country's culture the most important and widely distributed of the arts that were then in existence.

Passing from the processes of their manufacture to the technological description of the implements themselves in their different varieties of form and purpose, Mr. Evans presents us with an exhaustive review of the implements of the Neolithic period, extending to upwards of 350 pages. This portion of the work is most carefully and elaborately treated, and its value is greatly enhanced by the profusion and excellence of the engravings accompanying the descriptions. In the stone-using times the universal weapon was the flint arrow, or spear head, the universal tools the stone axe (frequently of flint), the scraper and the knife. With these the man of the stone period was thoroughly furnished for all the work and warfare he had to do in the world. The axes were apparently used as weapons or as tools, according as convenience or necessity dictated. Sometimes they were hafted in stag's horn, or in wood, though but one or two specimens of the wooden handle have been preserved to show the form and method of hafting; sometimes they were used in the hand, haftless, like the larger variety of the Maori axe, and occasionally they were provided with depressions on either side to give a firmer grasp to the fingers. Among them there are favourite forms, more abundant and widely distributed than others, and special varieties confined to particular areas, or characteristic of particular periods. But it is only in one form—that of the perforated axe-hammer—that we can distinctly trace the influence of the Age of Bronze. In this blunt-edged implement, which must have been utterly useless as a tool, though serviceable as a weapon, we mark for the first time the separation of the cutting use from the warlike use of an implement of stone, a separation which implies the existence of special tools for the former purpose. Besides this, the forms of some of these axe-hammers are obviously such as would never have been developed except in metal, while others are mere reproductions of similar forms existing in bronze. As yet, however, we lack the data for the chronological classification of the earlier types. In fact, the rude or unground implement has been found deposited with the polished type and with instruments of bronze. Mr. Evans suggests that as in one case an unground celt was found beside a skeleton in a barrow, along with the grind-

ing and polishing stones, and in company with two other celts that were completely polished, it may be significant of the belief that in some future state of existence the possessor might be at leisure to complete the grinding. But however this may be, if we have little to guide us in determining the relative antiquity of the different forms in use in the stone period, we have still less to assist us to any definite conclusion as to the duration of the period which was characterised by their exclusive use in Great Britain before the introduction of bronze. The fact most suggestive of the lengthened duration of this period is the universality of their distribution. Alike in their ruder and their more finished forms they are found everywhere from Cornwall to the Shetland Islands, and from Buchan to Galway. The demand for them seems even to have given rise to a systematic industry in the remotest times, when the miner's tools were picks made of deer's horns and wedges of flint. No more curious and suggestive discovery has fallen to the lot of any archaeologist of modern times than that made at Brandon by Canon Greenwell.

"In a wood near this place," says Mr. Evans, "the whole surface of the ground is studded with shallow bowl-shaped depressions from 20 to 60 feet in diameter, sometimes running into each other, so as to form irregularly-shaped hollows. They are over 250 in number; and one selected for exploration was about 28 feet in diameter at the mouth, gradually narrowing to 12 feet at the bottom, which proved to be 39 feet below the surface. Through the first 13 feet it had been cut through sand, below which the chalk was reached; and after passing through one layer of flint of inferior quality, which was not quarried beyond the limits of the shaft, the layer known as the 'floor-stone,' from which gun-flints are manufactured at the present day, was met with at the bottom of the shaft. To procure this, various horizontal galleries, about 3½ feet in height, were driven into the chalk. The excavations had been made by means of picks formed from the antlers of the red deer, of which about eighty were found. The points are worn by use, and the thick bases of the horns battered by having been used as hammers for breaking off portions of the chalk, and also of the nodules of flint. Where they had been grasped by the hand the surface is worn smooth, and on some there was a coating of chalky matter adhering, on which was still distinctly visible the impression of the cuticle of the old flint worker. The marks of the picks and hammers were as fresh on the walls of the galleries as if made but yesterday. A hatchet of basalt had also been used as one of the tools for excavation, and the marks of its cutting edge were plentiful in the gallery where it was discovered. There were also found some rudely made cups of chalk, apparently intended for lamps; and what is very remarkable, a rounded piece of bone, 4½ inches long and 1 inch in circumference, rubbed smooth and showing signs of use at the ends, which, as Mr. Greenwell suggests, may have been a punch or instrument for taking off the lesser flakes of flint in making arrow-heads and other small articles."

A series of similar pits has been explored at Cissbury by Colonel Lane Fox. Here then we have evidence of a systematic industry, prosecuted on a great scale, to meet the demand for the raw material from which the flint weapons and implements of the early ages were fabricated. And we also find in many spots where flints occur in the surface drifts, evidences of the existence of factories of these implements and weapons, in the

shape of heaps of refuse cores, flakes, chips and partially finished implements, rejected in the process of manufacture. It is clear that operations undertaken on such an extensive scale must have produced a supply far in excess of the actual wants of the district, and that there must have been an active commerce with distant regions less plentifully supplied by nature with the coveted material. It is equally clear that the more highly finished specimens which now grace the shelves of our museums, or form the special pride of private collections, must have been in their day objects of the greatest price, the possession of which conferred a distinction not otherwise to be attained. Hence, perhaps, the frequency with which the rarer and finer specimens are found deposited with the dead, placed in the urn, or laid among the ashes of the extinguished pyre.

JOSEPH ANDERSON.

Jewish History and Politics in the Times of Sargon and Sennacherib. An Inquiry into the Historical Meaning and Purpose of the Prophecies of Isaiah. By Sir Edward Strachey, Bart. Second Edition, revised, with Additions. (London: Isbister & Co., 1874.)

THERE is so much in this book that is sound and even beautiful from a moral and literary point of view, that it is doubly painful to have to deliver an unfavourable verdict upon it as a whole. The defects which characterise it, however, are not specially chargeable on Sir Edward Strachey. They are common in a greater or less degree to a crowd of popular writers, who flatter themselves that ordinary acuteness will make up for the want of a scientific training. They forget that though common sense has much to do with science, it must be a trained and cultivated quality, and are apt to deride those who, particularly in Germany, have passed through a special school of criticism. It is only too clear that Sir Edward Strachey is still under the dominion of this error. He even ventures to erect it into an axiom. He admits, indeed, "that the help of the German commentators is indispensable to a thorough understanding of the prophecies of Isaiah," but thinks "that they will be most serviceable to him who can best check speculation with not literal but matter-of-fact criticism" (p. 16). There is a still stronger and more offensive statement about diamonds and beads on page 161. I content myself with protesting against this invidious and inaccurate distinction between English and German criticism. The same want of modesty is apparent in the remark on page 178: "I see no sufficient reason to depart from this the older interpretation," &c. How many subjects are there on which each of us might say, if we had only the audacity, "I see no sufficient reason."

But the great question is, How does our author treat those chapters of "Isaiah" which have appeared to so many critics to contain manifest proofs of a Babylonian origin? His *πρῶτον ψευδος* is the assumption that there is anything like an historical tradition for the Isaianic authorship of these sections (see his note on p. 349). It is well known that the earliest trace of the book of

Isaiah in its present form is in the Septuagint version of it, written some time between 260 and 130 B.C., i.e. at least 500 years after the time of the prophet. But this merely shows that the volume of Isaiah was complete when the version was made. Being complete, it was only natural to ascribe it as a whole to the prophet whose name stood at the head of the earlier sections. But this ascription has only the worth of a conjecture, in spite of the author's astounding statement on p. 275. Sir E. Strachey refers several times, and I offer him sincere thanks, to my *Book of Isaiah Chronologically Arranged*, but how cursorily he has read it is shown by his remark on my relation to Ewald. Nor has he even attempted to meet any of my arguments for a variety of authorship, especially that primary one derived from the analogy of Old Testament doctrines. It seemed, and still seems to me, that one of the best tests of any hypothesis as to date or authorship is this—Will it agree with any natural view of the development of ideas? And I am not alone in the conviction that the unitarian hypothesis adopted by Church writers and (though with some hesitation) Sir Edward Strachey, will not. The fact seems to be that the author's eyes are dazzled by a brand-new argument, derived from the supposed coincidence between the disputed prophecies and the Assyrian inscriptions (see chap. ix.). And he appeals (p. 166) to the somewhat questionable authority of Mr. Maurice and the Dean of Westminster, who have been unwise enough to adopt his view of Isa. xiv. I have not space to do more than remark that, to an historical student of the inscriptions, it is quite inconceivable that the King of Assyria should ever have called himself, or been called by others, King of Babylon. And I say this in spite of Mr. George Smith's attempt (*Trans. of Soc. Bibl. Arch.* ii. 328), unknown apparently to our author, to draw a parallel between the first thirty-seven chapters of Isaiah and the Assyrian inscriptions—an attempt which, it may safely be predicted, will at no distant date be withdrawn by its author. With regard to the scholarship of the work, I need not say much. Sir E. Strachey reminds one rather of Mr. Matthew Arnold, in his blithe unconsciousness of the necessity of a philological training for the study of biblical literature. The translation is eminently unsatisfactory. It is based on the Authorised Version, but retains some (I have not examined it at all thoroughly) of the worst errors of its original. The essay itself is partly saved from mistakes by the absence of a directly exegetical mode of treatment. But there are several errors or misconceptions (see pp. 10, 43, 71, 122, 178, 181, 231, 359) such as no scholar ought to have passed. I am glad, however, that the author has modified the language used in the first edition about the derivation of *Koresk*. There is a strange, if not new etymology of the word "mosaic" (p. 81), and a curious statement about the debt of Phoenicia to Israel (p. 233). The explanation of Hebrew rhythm in chap. ii. is good as far as it goes, but does not account for all the phenomena. To the parallels in other literatures might have been added

Egyptian, Accadian, and Assyrian. The explanation of the promise of Immanuel is worth reading, because it is almost the only place where (as I venture to think) a correct view of the Old Testament usage of the word Alma (young woman? virgin?) is to be found, a view which I have myself advocated in *Notes and Criticisms on the Hebrew Text of Isaiah*, p. 8, though I believe the argument from so small a number of passages is not sufficient to counterbalance that from etymology. Let me say in conclusion, that the work is eminently readable, and distinguished by a felicity of diction and historical illustration, from which the discriminating reader will derive both pleasure and profit.

T. K. CHEYNE.

GRAMMAR OF THE INCA LANGUAGE.

Elementos de Gramática Quichua ò idioma de los Yncas. Bajo los auspicios de la Redentora, Sociedad de Filántropos para mejorar la suerte de los Aborígenes Peruanos por el Dr. José Fernandez Nodal, Abogado de los tribunales de Justicia de la República del Perú. In-8°. (London: Trübner & Co.)

THE *Elements of Quichua Grammar*, by Dr. José Fernandez Nodal, are divided into five parts or books, beginning with a Philosophy of Language in general, followed by the Grammar, Syntax, Orthography, and Prosody of the Quichua language. The whole forms a book of about four hundred and fifty pages, half of which are filled with dissertations on all kinds of subjects, wholly unconnected with Quichua grammar. Thus, in Book the First we have observations on the elements of words, on tropes, on poetry; notions of music; notices of the great epics of all ages, beginning with the Mahabharata, and concluding with "the Tahuansuyada." When this last name first caught my eye, I must own I was not a little astonished by its uncouth appearance, and my total ignorance of what the thing thereby designated was like. I felt happy to learn very soon that "the Tahuansuyada" is not an actually existing poem, but only the possibility of a future poem.

"The Tahuansuyada is the pseudonym of the future epic which will embody all the ethnography, history, legends, and popular traditions of Peru, with such style and versification as might appropriately reflect the illusions which that bewitching geographical word has left behind for centuries and centuries."

The second and third books treat almost exclusively of the grammatical forms of Quichua, and are more to the purpose than the rest of the work. They have been compiled from the old treatises of Holguin, Torres Rubio, Juan Martinez, and not taken down from the mouth of natives. Thus M. Nodal, giving the suffix of what he calls the genitive in nouns, has only the form in *p* or *pa*—*cunturpa*, *siellar*—"of the condor," "of the jacinth:" he does not know the form in *k*, which is now usual in the dialects of Bolivia and Tucuman, and is found in Ollanta—*Inkak* for *Incap*. It is also to be regretted that he has not rejected the curious paradigms of declensions and conjugations with which early Spanish grammarians have encumbered Quichua grammar. Diego de

Torres Rubio and Holguin tried hard to construct Quichua conjugations on the pattern of classical conjugations, and gave to innocent Quichua verbs supines and gerundives, because Latin verbs had supines and gerundives. Since then all grammarians down to Honorio Mossi and Nodal have given as supines and gerundives Quichua forms which have nothing whatever to do with those *soi-disant* forms of Latin.

The two remaining books contain very little which is of interest for Quichua students. Thus, in Book the Fourth, four pages only are devoted to determine the laws of Quichua accentuation; the rest being full of scraps of information on musical, commercial, medical signs of abbreviation, on secret cyphers, &c. Book the Sixth is a compilation of rules of prosody and extracts from Spanish poets. It contains some interesting observations on the quantity of Quichua syllables, but upon the whole I cannot conceive what relation there can be between Quichua and a "Sonnet on Cholera" by Francisco M. Sanchez de Tagle.

The only contribution of real importance in the Sixth Book is the new text of Ollanta which is given in it. I have compared Nodal's text with those of Tschudi and Clements Markham line by line, and I have found it entirely different from them. Tschudi's and Markham's texts agree on the whole, and can be traced up to the same manuscript; but Nodal's text not only differs in minor points, but in the more strict versification, rhythm, and rhyme than are found in the hitherto known editions. As M. Nodal says in his Introduction (p. 417) that "he contented himself with giving a mere transcript of this document, expurgated from the grammatical and typographical errors which have hitherto corrupted it," we must suppose that his manuscript is not a reproduction of the Tschudi and Markham versions, but a new recension of the original drama.

If we were to judge M. Nodal's work by a European standard, we should say that half of the book at least might, with advantage, have been dispensed with. But we must remember that M. Nodal wrote for a Peruvian public, at the instigation of a Society of Popular Education. Many of the notions which seem unnecessary to us will be of great utility for the instruction of native scholars. M. Nodal's book will propagate amongst Peruvians of the middle class not only a knowledge of the Peruvian language, but a general acquaintance with many things of which they have been hitherto almost ignorant.

G. MASPERO.

Leçons d'Épigraphie Assyrienne. By Joachim Ménant. (Paris: Maisonneuve & Cie., 1873.)

M. MÉNANT tells us in his Preface that the first of the series of lectures on the Cuneiform System of Writing, which are printed in the present volume, was attended by a large number of auditors; and he seems to complain that after a few lectures the number was reduced to from fifteen to twenty, at which it remained fixed. The statement fills us with astonishment and envy. We wonder how many, if any, of the four or five thousand members of our two chief English

Universities would have found their way to a single lecture on such a subject. The contrast is certainly striking between the teacher at the Sorbonne and the teacher at Oxford or Cambridge, where a Chinese culture with its interminable round of examinations is destroying both leisure and inclination for disinterested study.

The sixteen lectures themselves are an introduction to the reading of the Assyrian inscriptions, and an explanation of the difficulties inherent in it. They assist the student over the first and hardest part of Assyrian interpretation, and prepare the way for a grammar of the language. It will thus be seen that they fill a place hitherto unoccupied, although the subject-matter of them is the basis upon which the whole structure of decipherment is built. The small number of those who have devoted themselves to Assyrian researches is perhaps largely due to the immense difficulties attendant on the preliminary labour of reading the texts and the want of any guide and assistance in overcoming them. This want is now supplied. The lecturer starts with the Persian legends which furnished the key to the meaning of the Assyrian, and methodically works up from these to the determination of a syllabary, the application of this syllabary and its polyphonic characters, and the distinction of ideographic and phonetic values. After pointing out the hieroglyphic origin of the characters, which explains at once their ideographic use and polyphony, he concludes with a notice of the inscriptions of Armenia and Susiania in which the Assyrian syllabary is employed to express non-Semitic languages.

The lectures were delivered at the Sorbonne in 1869; but political events prevented an earlier publication of them. Considering the length of time he had them by him, M. Ménant might have shown himself a more careful corrector. The cuneiform characters are not unfrequently printed incorrectly, and their transliteration is sometimes inaccurate or defective; while we find such oversights as *Akahu* for *Akhahu* (p. 62); *du-u-hu* for *du-u-ku* (p. 64); *erib*, "setting," instead of *atsu*, "rising" (p. 93); or *zulu*, "column," instead of *dalatu*, "door:" and the author must know that *labar palie* (p. 86) is not "the victory of the sword," as M. Oppert imagined in the early days of Assyriology, but "length of regnal years." Perhaps, too, he might have added a footnote referring to M. Lenormant's attempt to compare the language of the Vannic inscriptions with the Georgian idioms; and the Susian legends are not so utterly unknown as he represents them to be. They are written in a cognate dialect to that of the Third Akhaemenian (or "Medo-Scythic," as the French writers call it) and of the inscriptions of Mal-Amir, as may be seen from the two Susian bricks given in the volume, which contain the Third Akhaemenian words *a'ak*, "and;" *'sunkik*, "kingdom;" *wa* or *û*, "I;" *sak* (Elamite *sak-ri*), "son;" and the genitive-ending *-nina*.

The form of the book leaves nothing to be desired. Its good paper and print and large margin invite a perusal; and a copy of the tablet which gives some of the primitive hieroglyphics out of which the cuneiform

characters have developed, will be interesting to scholars who are unable to visit the treasures of the British Museum.

A. H. SAYCE.

Hermathena: A Series of Papers on Literature, Science, and Philosophy. By Members of Trinity College, Dublin. No. II.

THIS number completes the first volume of a magazine which all scholars have already welcomed, not only for the excellent matter which it contains, but still more for the hopefulness of its appearance, as a sign that our universities are gradually awakening to a new sense of their functions. It may be left to those who use the sacred name of Education to discredit original inquiry to find out whether the teaching of Trinity College is the worse for the publication of *Hermathena*.

The first article—that of Professor Mahaffy on “The Degradation of Odysseus in Greek Literature”—belongs to a subject which has been too much neglected in the English classical course. The tendency among English students to divorce minute scholarship from philosophy shuts them out from a field of the greatest interest, lying on the confines of the two subjects. Professor Mahaffy has chosen a question from this field which has long occupied Greek scholars—the falling off in the Homeric characters, especially in that of Odysseus as represented on the Attic stage. He begins by rejecting the notion that there is any falling off in morality, or in the power of appreciating moral excellence, between the time of the Homeric poems and that of the drama. As he most justly points out, the “degradation” is limited to certain characters: “Neoptolemus and Ajax are as great in Greek tragedy as in the Greek epos.” The apparent innocence of Homeric morals is due, not to the absence of evil, but to the absence of the distinction between evil and good. Professor Mahaffy’s theory is that the Odysseus of tragedy is mainly due to the genius of Epicharmus, the Sicilian comic poet and philosopher. In both these characters he is a very probable author of such a creation. As a comic poet he is known to have addressed himself to the love of parody, and of fixing upon weak points of character, which belonged to the Greeks, and especially to the Sicilians. As a philosopher he shared in the “ancient quarrel” with poetry, and condemned the morality of Homer in the spirit in which it was condemned by Xenophanes, and afterwards by Plato. This view is supported by the parallel case of Herakles, whose unheroic character (as the glutton in the *Alceste*) can be clearly traced in the fragments of Epicharmus. It is also confirmed from indications in Pindar, who often seeks to defend the mythology by giving it a moral interpretation. Once established by Epicharmus, such a drawing of a favourite hero could not but react on the Odysseus of tragedy. It may be questioned, indeed, whether the Odysseus of the Ajax and Philoctetes is quite as bad as Professor Mahaffy takes him to be. He is certainly the “hero of stratagem,” crafty and unscrupulous; but he is full of unselfish patriotism, and is not without generosity to a noble and blundering enemy. Still, there is a prominence given to the crafty and treacherous side of his character of which only the germs are to be found in Homer, and for this Professor Mahaffy’s theory supplies a welcome and highly tenable explanation.

Professor Atkinson, whose own subject is Sanscrit, shows his versatility by writing in the last number on Old French; in this, on the Trisyllabic Endings of the Pentameter in Propertius. He makes the curious discovery that Propertius does not use a trisyllable at the end of a pentameter unless it contains a liquid.

Professor Tyrrell’s “Euripidea” and Mr. Palmer’s “Coniectanea” are chiefly taken up by emendations of the Tragic Fragments, many of them very convincing, though sometimes so bold as to make one glad that the subjects of experiment are only frag-

ments. Mr. Palmer also gives some on Propertius, one of them, at least, of the highest merit; viz., in Prop. iii. 7. 27, he restores *nunquam . . . cubares for non quia . . . cubaris*; the preceding couplet begins with *nunquam*, and the succeeding couplet with *non quia*.

Dr. Henry contributes two Virgilian articles, on *Aen. i. 240* (the passage about the Timavus), and *Aen. ii. 1*. The former is especially interesting as the result of a careful exploration of the famous river itself. “The mountain is there, the numerous *ora* are there, and are as differently counted as ever by different visitors; the flood outbursting through them like a sea is there, the river is there and called by the same name.” We will not spoil the future reader’s pleasure by quoting more. There is also a good note on *Aen. viii. 102–109*, by Professor Brady.

Two of the articles are distinctly polemical: a review by Mr. J. F. Davies of Professor Campbell’s *Sophocles*, and an article by Professor Ingram on “Greek and Latin Etymology in England.” The following sentence may serve as a specimen of the former: “He [Professor Campbell] follows the fashion set by Mr. Shilleto, who deferred for an indefinite period his treatment of the exact point which I had chosen as a test whether he was a clear-sighted editor of Thucydides.” Editors will probably wish that Mr. Davies, living at this serene and epicurean height, either did not exist or did not concern himself about human affairs. Professor Ingram’s criticism is of a very different stamp. He examines the etymology contained in three well-known books, without any affectation of superiority, but with a great deal of the reality.

Professor Maguire’s article on the *Philebus* of Plato is not without ability, but is rather obscurely written, and open to an accusation he quotes as having been made by Mr. H. Sidgwick of reading modern thought into Plato. Mr. Purser, in his paper “On the Kantian Theory of External Perception and of the Primary and Secondary Qualities,” maintains that Kant held a presentative rather than a representative theory of perception.

Mr. Thomas K. Abbott gives an account, founded on materials collected by the late Professor Ferrar, of four manuscripts of the Gospels, preserved at Paris, Leicester, Vienna, and Milan, which point to a common uncial original, “more independent than any of the other uncials, often standing alone amongst Greek MSS., or nearly so; whilst in many such cases it has the Armenian version, or of ancient Italic codices, or of some of the Syriac versions.”

Science is represented in the *Hermathena* by three articles, of which we will give the titles only:—“On the Nature of the Bounding Surfaces of Bodies,” by Mr. Jellett; “A Sketch in the Theory of Screws,” by Professor Ball; “On a Geometrical Method of Deducing the Central and Diametral Properties of Conics from those belonging to the Focus and Directrix,” by Dr. Tarleton.

It may be noticed, in parting from this valuable and hopeful collection of papers, that the contributors have succeeded in several cases in combining special knowledge with considerable versatility, and that, in consequence, they are especially successful in subjects which lie on the borders of the great departments of study. If there is anything that English readers would like to change, perhaps it is a tendency in some of the writers (by no means in all) to a humorous redundancy of style. Doubtless this is partly due to local causes, and is akin to the whooping and waving of sticks which is believed occasionally to be the prelude to more serious encounters between their countrymen.

D. B. MONRO.

THE French Association for the Advancement of Science will hold its third meeting at Lille from August 20 to 27. M. Ad. Wurtz is the president for the year, and M. Kuhlmann is the president of the local committee.

NOTES AND NEWS.

ACCORDING to the views of most geologists, a hard and fast line may be drawn sharply separating the uppermost of the Secondary from the base of the Tertiary strata, and representing in fact one of the broadest breaks in the geological series. During the progress of the surveys of the Western States of America facts have been gradually accumulating, which tend to show that this gap may be more or less completely bridged over. Thus Dr. Hayden has described under the name of the “Transition Series” a group of coal-bearing deposits, which appear to find their proper position between the Cretaceous and Tertiary formations. That these beds are strictly transitional appears to be established by Professor Cope’s observations recently published in a valuable essay “On the Mutual Relations of the Cretaceous and Tertiary Formations of the West.” The transition-beds represent in their lower part marine conditions, and pass upwards through brackish-water deposits into others of a purely fresh-water origin. The mollusca of the lower and the vertebrata of the upper beds are said to be decidedly Cretaceous, but according to high authorities the associated flora presents equally well-marked Tertiary characters. Professor Cope therefore sees “no alternative but to accept the result, that a Tertiary flora was contemporaneous with a Cretaceous fauna.” As an illustration of this curious intermingling of types otherwise widely separated, we may refer to the discovery of a Mesozoic Dinosaur (*Agathaumas sylvestris*, Cope), which had the cavities between its bones stuffed full of the leaves of Eocene plants. Such facts go to show that in all likelihood an uninterrupted succession of life may be traced across what is generally regarded as one of the greatest gaps in geological chronology.

Professor Cope’s essay, to which we have just referred, forms an introduction to his Catalogue of the Vertebrata of the Cretaceous Period found West of the Mississippi River. The catalogue and introductory essay are published in the last number (the second) of the *Bulletin of the United States Geological and Geographical Survey of the Territories*. This promises to be a periodical of great utility, serving as a medium for the prompt publication of new materials collected in the course of the survey.

Among the Cretaceous deposits of the Western States is a set of beds known as the Dakota group. The vegetable remains from these deposits have been recently studied with great care by Mr. Leo Lesquereux, who has published a valuable report on the general characters and relations of the Dakota flora. The fossil leaves are mostly those of dicotyledons, and it is remarkable that they belong to genera which still characterise the flora of North America. The plants are quite distinct from those of the Lignitic beds of the Western States, which have recently been the subject of some controversy. Dr. Newberry, as we had occasion to observe a few weeks ago, maintains that many of these lignites are Cretaceous. In replying in *Silliman’s Journal* to this paper, Mr. Lesquereux produces a powerful argument in favour of the Tertiary age of these coal-bearing beds, and refers most of them to the Miocene series.

WITHIN the last two or three years, valuable deposits of phosphorite, or massive phosphate of lime, have been discovered and actively worked at several localities in the departments of the Lot and Tarn-et-Garonne, in the south of France. These phosphates occur partly in irregular deposits or “pockets,” and partly in true veins running through limestones of the Middle Oolites. The phosphates are interesting, not only for the curious concretionary and agatiform structures which they present, but also for the fossil vertebrata with which they are associated. They have, in fact, yielded a mammalian fauna similar to that discovered by Cuvier in the gypseous deposits of the

Paris basin. But in addition to *Anoplotherium*, *Palaeotherium*, and other well-known Paris fossils, the French phosphates are associated with other mammalia perhaps equally remarkable, and certainly more novel. M. Delafortrie has found in the phosphate of Beduer a cranium which he referred to the lemurs, or Madagascar monkeys, and regarded as the representative of a new genus to be called *Palaeolemur*. In the last number of the *Annales des Sciences Géologiques*, M. Filhol publishes a long paper, in which he seeks to show that this fossil is not a true lemur, but that it forms a new zoological type of great interest, combining many of the characters of the lemurs with others of the pachyderms. M. Filhol associates *Palaeolemur* with the *Adapis* and *Aphelotherium* of Cuvier, together with the American fossils which have been regarded as lemurs, and distinguishes the group which he thus forms as *Pachylemurs*. In the present paper he describes a new species belonging to this group, found in the phosphates of St. Antonin, and named *Adapis magnus*. In addition to these pachylemurs, the true lemurs were represented in France in Lower Miocene times. Indeed, M. Filhol has obtained from the French phosphates the remains of a lemur which he describes and figures under the name of *Necrolemur antiquus*.

SOME elaborate Researches on the Fossil Insects of the Tertiary Deposits of Aix, in Provence, have been contributed by M. E. Oustalet to the recent numbers of the *Annales des Sciences Géologiques*. The technical descriptions are illustrated by some good lithographic plates.

It is maintained by M. F. Garrigou that a series of bands of crystalline limestone on the French side of the Pyrenees must be referred to the carboniferous limestone; and that the marbles of Mont and of St. Bât belong to this series, and are not of an older age, as M. Leymerie has recently suggested.

DIABASE is one of the dark-coloured crystalline eruptive rocks, of which several species are popularly confounded together under the general name of "greenstone." The microscopic structure of diabase has recently been studied by Herr Dathe, of Leipzig, whose results are published in the current number of the *Zeitschrift der Deutschen Geologischen Gesellschaft*. Dathe distinguishes two groups of diabases: the one consisting of a plagioclasic felspar, augite, titanite, magnetite, iron-pyrites, and apatite; whilst the other group, called *quartz-diabase*, contains these component minerals associated with quartz. This quartz may be either an original constituent of the rock or a secondary product. The augite and magnesian mica become changed into viridite.

It is curious to find a paper by Herr L. Meyn in the last number of the *Zeitsch. d. Deutsch. Geolog. Gesell.*, in which the author maintains that the pebbles of our well-known Hertfordshire "pudding-stone" are not rolled flints as commonly supposed, but are brown jaspers representing silicified sponges, probably of Silurian age. The author as a boy was in the habit of playing with the round pebbles, formerly brought in great quantity to Kiel as ballast from England, and used for paving under the name of "Wallsteine." He refers these pebbles to a similar source, and is anxious to know from English geologists their locality and the geological position which they occupy. We suspect that they are the well-known pebbles of the Oldhaven beds, probably taken from near the Thames. Herr Meyn also brings the Egyptian jaspers of the Nile valley within his silicified-sponge theory. He was led to these conclusions by observations on certain fragments of blue rock, occasionally containing Silurian fossils, found on the shores of the Isle of Sylt.

A COMPREHENSIVE review of the geological and topographical distribution of the Jurassic iron-ores of Germany is contributed by Herr J. Haniel, of

Berlin, to the last number of the *Zeitschrift* of the German Geological Society. The Lias and Oolites are carefully divided into zones, and each zone described in detail.

UNDER the name of *Wheelerite*, a new fossil resin has been described in *Silliman's Journal* by Mr. O. Loew, who was attached as chemist to the surveys west of the 100th meridian. It was found in the course of the survey-work in northern New Mexico. *Wheelerite* is a yellowish resin occurring in Cretaceous lignites, and resembling the retinasphalt which is associated with our Miocene lignites at Bovey Tracey in Devonshire.

ACCORDING to the researches of Signor Conte Abate F. Castracane, the group of vegetable organisms known as the *Diatomaceae* can boast of a much higher antiquity than that which most palaeontologists have hitherto accorded to them. After certain diatoms had been found in a lignite associated with rock-salt at Wieliczka, in Poland, the Abbot was led to study a thin bed of Miocene lignite near Urbino, and in this coal he found fossil diatoms. But he has lately obtained evidence that the *Diatomaceae* were represented as far back even as the Carboniferous period. In fact, he has detected these microscopic structures in our Newcastle and Lancashire coals, in Scotch cannel, and in French coal from St. Etienne. These palaeozoic diatoms are said to be identical specifically with certain forms still living. The researches form the subject of two papers recently published in the *Atti dell' Accademia Pontificia de' Nuovi Lincei*.

It is not a bad notion to attach a photographer to the staff of a Geological Survey, especially when the work happens to lie in unexplored districts. This has been done with excellent results by some of the State surveys in America. We have recently received a descriptive catalogue of the photographs of the United States Geological Survey of the Territories by Mr. W. H. Jackson. According to this list the collection now includes upwards of 1,300 landscapes of Western scenery, taken during the summer campaigns from 1869 to 1873, inclusive. In addition to these geological and topographical views, the collection numbers over a thousand ethnological photographs, representing types of sixty-five tribes, selected from nearly every portion of the Western territories. As the Red man is fast fading away, these photographs will have great value to the future historian. The collection of ethnological photographs has been greatly enriched by the liberality of Mr. W. Blackmore, well known as the founder of the Blackmore Museum at Salisbury.

MR. DARWIN has made a most interesting addition to our knowledge of the power possessed by plants of digesting animal substances, in the discovery of phenomena presented by the leaves of *Pinguicula vulgaris*, the common butterwort of our subalpine bogs, similar to those which we have already recorded in the case of *Drosera*. According to a communication from Mr. Darwin read at a recent meeting of the Scientific Committee of the Royal Horticultural Society, albumen, fibrin, meat, or cartilage induce a secretion from the glands of the upper surface of the leaf, which is feebly acid. This secretion is reabsorbed, and causes an aggregation of the protoplasm in the cells of the glands, within which a motion is distinctly perceptible. When insects or seeds are placed near the margin of a leaf, the whole margin or a single point becomes curled over considerably in two or three hours, but the apex of the leaf does not turn over. Small fragments of glass cause a similar movement, but to a much less degree; and in this respect a difference is exhibited from the observed phenomena in the case of *Drosera*. The inflexed margin of the leaf pours forth a secretion which envelopes the insects or seeds, but pieces of glass give rise to very little, if any, increase of the secretion. The use of this inflexion is, however, not evident, since the mar-

gin will turn back again in less than twenty-four hours, whether the insects or seeds are still adherent to it, or whether they have been removed.

M. GRAND, describing the coal fields of Spain to the Society of Civil Engineers (Paris), estimates their area at 150,000 hectares (the hectare being about 2·47 acres), from which only 500,000 or 600,000 tons are annually extracted, while Belgium, with the same area, yields ten millions of tons. The Spanish coal fields are situated in Castile, Leon and Asturias. The mining is chiefly carried on in the valleys of Caudin and Nalon, where the coal can be reached by galleries a little above the valley level. The processes are described as being very rough and imperfect. M. Delesse stated that the coal of the Asturias was adapted for gas making.

M. TOURNOUR has reported to the Geological Society of Paris the results of M. Saporta's examination of the tufa of Moret, showing from the character of its flora a more temperate climate than now exists on the Seine. The fig tree is found associated with the Judas tree and a laurel thyme. These three species, now exotic in the climate of Paris, are associated with many northern species already known in the quaternary tufa of Provence or Würtemberg. The quaternary fig of Moret has leaves either entire or trilobed, not differing from existing species. The remains of its figs are very numerous, and show that it was a wild tree not improved by cultivation. Most of the mollusks belong to existing species, but denote a difference of geographical distribution: a bulimus and a cyclostoma indicating a warmer climate. The tufa appears to belong to the time of the *Elephas primigenius*, and the men of the Stone age occupied a hillock it forms on the banks of the Seine, from which numerous implements of the Polished Stone age have been obtained.

M. HENRY recently exhibited to the Biological Society of Paris photographs of hands of the upper classes of the Annamites characterised by the long finger-nails esteemed as a mark of gentility. One of the photographs represented nails 40 to 50 centimetres in length (15 to 20 inches!) and very curiously carved in fantastic patterns like some of the claws depicted in ancient illuminations. Notwithstanding their length these nails were not hypertrophied.

THE Governor-General of India has invited some of the most distinguished native scholars to attend the International Congress of Orientalists in London. It is to be regretted that several whose presence was particularly wished for in London, have declined for fear of losing caste. But although the representatives of the old school of Sanskrit scholarship will not be there, some of the younger scholars are expected. At Bombay, R. G. Bhāṇḍārkar has declined from religious scruples, but Shankar P. Pandit, the learned editor of Kālidāsa's *Raghuvamśa*, has accepted. We learn with great regret that Dr. Bhao Daji, who was expected to join the Congress, is dead. As a collector of Sanskrit MSS., inscriptions, and coins, he had rendered most valuable services, and his liberality in lending his MSS. to scholars in England has frequently been acknowledged. It is to be hoped that his Essays may be collected and published in a separate volume. They all possess great and permanent value, and some of his discoveries in archaeology and the history of Sanskrit literature will secure to Bhao Daji's name an honoured place in the history of Sanskrit scholarship.

PROFESSOR MASPERO has lately published a pamphlet on an Egyptian Stele in the Museum of Rennes, which he shows to belong to the earliest years of the twelfth dynasty. The individual whom it commemorates was born shortly after the accession of Amenemha I. The chief interest of the monument consists in the testimony which it bears to the cult of dead ancestors among the ancient Egyptians, and the large place that it occupied in their lives. The heirs of the departed

are bound to observe yearly in his honour three "festivals of the seasons," twelve "festivals of the month," and twelve "festivals of the half-month"—twenty-seven regularly recurring festivals in all. We could hardly expect to find more among the Kafirs or the Chinese.

WE have received a paper by M. Julien Vinson on the Iberian Problem, which was read before the Congrès Scientifique de France last year. The author sets the philological place of the Basque in a good and clear light, and goes on to criticise the theory of Humboldt and his followers that this interesting waif of language was once widely spoken over the southern part of Europe, and even in northern Africa, and that the topographical names in Spain, in southern France, and in Italy, transmitted by the ancients, can only be interpreted by its means. M. Vinson points out the extreme doubtfulness of Humboldt's method and conclusions, so little in accordance with the strict rules of scientific philology. He concludes with a notice of the various attempts made to decipher the so-called Iberian legends on coins or elsewhere. The contradictory character of the transcriptions hitherto proposed inspires but little confidence, and the words read by M. Heiss, the latest and most thorough-going decipherer, on the Castellon inscription, show scanty likeness to anything Basque.

AFTER a long period of silence, which students of Biblical and Jewish literature have greatly regretted, a double number of Dr. Geiger's *Jüdische Zeitschrift* has appeared. It contains, *inter alia*, the editor's report of his lectures on Jewish history and literature at the new High School of Jewish learning at Berlin, and valuable reviews of works by Drs. Strack and Merx, learned Rabbinic scholars, and Dr. Ginsburg.

Hermes: Zeitschrift für Classische Philologie (Herausg. von Emil Hübnér), vol. viii. heft 4.—Articles: "On the Beginning of the Seven against Thebes" (vv. 1-181), by C. Conradt (a series of notes). "On the Distinction of *δικαιοσύνη* and *σωφροσύνη* in the Platonic Republic," by R. Hirzel, (makes out the distinction to be that Justice is the virtue of the several parts, "each doing its own," and Temperance the virtue of the whole resulting from this right relation between the parts). "Tituli Phocici et Boeotici inediti," by G. Kaibel, (the result of a recent tour: one or two are of high antiquity). "Accounts of a Boeotian Hipparch," by U. von Wilamowitz Möllendorff, (an inscription throwing some light on the military finances of Thebes in the Macedonian time). "On some Designations of the Characters in Greek Dramas," by E. Hiller, (shows that the names of all characters are made known to the audience by the poet, except in the case of gods appearing, the mask then sufficing. Thus Atossa in the *Persæ* should be simply "the Mother of Xerxes;" Mnesilochus in the *Thesmophoriazusæ* is only a *κῆρυξ* *ἐπιπίδωρ*, and probably not Mnesilochus). "On the Life of Hesiod," by H. Flach, (chiefly on the stories connecting him with Aulis and Locris). "Antiquarian and Critical Remarks on Roman Writers," by O. Hirschfeld. "The Plural Forms of the Pronoun *hic* in Plautus and Terence," by F. Schmidt (proves that the forms with *c*, *ce* occur before vowels, the others before consonants, without any distinction in the meaning. The rule is invariable in Terence).

M. ERNEST RENAN's splendid work, *La Mission de Phénicie*, is now complete, consisting of 888 quarto pages of letterpress, and seventy folio plates. It gives a complete account of the excavations and researches carried on in Syria in 1860 and 1861, during the occupation by the French army. M. Renan and Dr. Gaillardot have neglected no detail which might prove useful in the event of future researches. The collection of inscriptions especially has been made with all possible care, and each text is accompanied by explanations. The plates are executed under the direction of M. Thobois, architect.

FINE ART.

Lectures and Lessons on Art, being an Introduction to a Practical and Comprehensive Scheme. By F. W. Moody, Instructor in Decorative Art at South Kensington Museum. With Illustrations. (London: Bell & Daldy, 1873.)

A Story of Ecclesiastical Intolerance. By F. W. Moody. With Illustrations. (London: Curcio & Co., 1874.)

PERHAPS some of our readers may remember the staircase leading to the west end of the Ceramic Gallery of the South Kensington Museum. It is ornamented with pictorial ceilings, rich Renaissance dado in white porcelain, and two painted windows exhibiting groups of figures in tight hose, standing in Italian fancy porticoes, labelled "Michelangelo," "Gillio," and so on. If they do remember the art displayed here—and admirable art it is from a certain point of view, although it has been severely handled by the critics—they will know Mr. Moody's greatest achievement as far as we are aware, and they will understand his position, and have a key to the *Lectures and Lessons on Art*. Part of the enrichment of this staircase is given as a frontispiece to the volume, and a very good one it is; but whether the portion so represented is designed by Mr. Moody or by the late Mr. Sykes, who had a talent exactly similar, we are uncertain.

And this uncertainty, it is worth while to remark, is significant. The style of decoration has little or nothing to do with modern things or ideas, it has no particular meaning, and does not represent beautiful things except to the educated; it is wholly derived from the sixteenth century, and the performer is altogether dependent on skilful drawing and modelling. This very skill is of a peculiar kind, and to be successful must reproduce the spirit as well as the letter of the old work; it must amount to a sleight of hand that evades description, and cannot be taught except in a perfunctory and lifeless manner. Mr. Sykes, who unhappily died in the midst of his task at South Kensington, had a genius for the Italianesque, as those columns surrounded by *amorini* designed by him show; and Mr. Moody, who has now a class of advanced students under him, has the same sympathy with the style, and possesses the same able drawing imitative of the Farnese, and the *Lectures and Lessons* are addresses to the students, and "are published in the hope that they may be found useful to a larger circle, and perhaps not uninteresting to more advanced artists who may wish to turn their attention to ornament." In this we quite agree with the author, and even go a step further, believing the level of Mr. Moody's thinking and his expression of his creed, and even the creed itself, to be better fitted for the advanced and educated than for learners, and for scholars in art rather than for ornamentists. "Art" with Mr. Moody is "not nature; but, as Emerson says, 'it is nature passed through the alembic of man'—a sentence worth all Mr. Ruskin's philosophy; art is not a photograph, but a man's view of nature, and for this reason it enlists our human sympathies. It is not so much the imitation of nature as the expression of man; the Ideal is the very soul of art

and its glory." The writer who stands on so high a platform as this is worth listening to, and throughout his book there is a great deal that is valuable. But the value is theoretical, not practical; he addresses his audience as if they were all masters, not students, and as if every one, on being told such trenchant truths as the above, had nothing to do but to act upon them, and, having acted upon them, make his fortune:—

"Be not confounded or dismayed," he says, "by the universal criticisms of the day, which have actually terrified most artists into being ashamed of admitting that they have done any part of their work without copying it immediately from nature. How constantly you hear men tell you that they shall have nature for every bit of their work, as if that were a credit to them; or they will justify any objectionable or obtrusive detail by saying it was so in the model, and be perfectly satisfied. Throw all this nonsense boldly to the winds, for it is this which is the ruin of art. Study nature so completely that you master her principles, and then you will be free from all the difficulties that arise from the individuality and detail of the model."

We have often heard that there is no royal road to excellence in art, that art is multiform, *Ars longa est, vita brevis*; but that is all a mistake; there is a royal road, and it is through Mr. Moody's class-room. The greatest masters of the beginning of the sixteenth century in Italy produced the greatest art the world has seen; they did it without teaching principles, without consciously following any theories indeed; but we must now do the same by a totally opposite course, by knowledge acquired through imitating their works and repudiating all else. Mr. Moody says, indeed, "we do not sufficiently study from nature," a startling admission; he also allows, that "with regard to Gothic architecture, no doubt there is much to be said in its favour," adding in a note "its greatest recommendation is its cheapness." These are concessions for which we are grateful, but they only enhance the feeling of supremacy possessed by the author who is able to reproduce the drawing and the sentiment of—we were going to say, Michelangelo, but looking to the decorations that head the chapters in both publications, we are constrained to say, although Mr. Moody may not like the change—the school of Bologna. These are masks and figures, *athletæ* or satyrs, bound to each other and ending in acanthus foliage, a repetition of a few motives that we see in Italian palaces in such profusion that the tourist's life becomes a burden to him.

Supposing, however, that this late Renaissance architectural decoration were not the taste of a decadence, suppose it was not characteristic of a land and an age "in which it seemed always afternoon," but had in it a vitality that kept it good for us, as anything in life is "from the cedars of Lebanon to the hyssop that groweth upon the wall;" we object to Mr. Moody's repudiation of everything else. We must have designers for floor-cloths and carpets, wall papers and hangings, and a thousand other things, and it is absolutely certain that the two sources of all ornament that is to give us pleasure as ornament, are either representations, or adaptations by analysis, of objects

in ordinary Nature, and Geometry. These two give us the basis of all the decorative arts, and, worked through the imagination of the artist according to the sense of national taste, have crystallised as Oriental, as Moorish, as Runic, Gothic, or what not, and they are all supremely interesting. Moreover, the return to objective study, to the correct representation of things, was the new life of the Renaissance, allied no doubt to the increasing knowledge of the ancients, especially in literature. In the works of Della Robbia, and in those of Ghiberti, naturalism entirely prevails; it does so in the grandest accomplishment of modern art, the ceiling of the Capella Sistina, where the suggestions for some of the figures, that christened Boaz for example, which is a beggar talking to the carved head of his stick, and (if we recollect right) the "Woman winding thread," have been found in small pocket-book sketches, apparently "lints taken hastily in the streets of Rome." But after this came the eclectics, artists Mr. Moody objugates; but these *macchinisti*, and conventional composers, followed exactly the plan of teaching our lecturer is trying to reproduce. "That knowledge is power," our lecturer says, "is especially true in art," an astonishing paradox, seeing that science is knowledge, the sciences in modern speech meaning codified knowledge on detached subjects, whereas art always was and must be empirical. "The works of Perugino," he says, "are perhaps more useful to the student than those of any other artist;" and again, "For study no man is so useful as Raphael." Better than this would be to remind students in decoration that "a little learning is a dangerous thing." We cannot even write of Michelangelo's Night and Day, as the opposing figures on the Medici tombs have been called, Rest and Unrest, Watching and Sleeping, as they ought to be, without mentally bowing the head, but we think a law ought to be passed prohibiting anyone, even Mr. Watts, from impairing their impression by reproducing them. Imagine half-a-dozen young men obeying Mr. Moody, "throwing the nonsense" of imitation of individual nature "to the winds," and going in for outdoing Michelangelo! Mr. Moody has already given us Truth flying out of the arms of Ignorance on a ceiling, and Analysis shaking hands with Synthesis on a painted window. But perhaps he expects to have only such potential natures and able artists under him as will originate new works equal to the old.

We make these strictures on the possible tendency of the *Lectures and Lessons* in all sincerity, and having acknowledged how much there is in the book that is admirable in a high degree. The truth is, Mr. Moody is an enthusiast, and was once as violently attached to Gothic as he is now to the late Renaissance. This is shown by the second and smaller book at the head of our article. This *Story of Ecclesiastical Intolerance* may be related in a few words. Mr. Moody designed a monument for his father, the late rector of the parish of Chartham, of course in the style he now admires, both because he prefers it and because the new monument was intended to be a pendant to one erected in the same taste in 1596, and still existing

in perfect preservation. The present rector objected because he did not like the Italian style, and because he was about to have the church, which was decaying, restored. Mr. Moody went to law; he confesses the choir of a church is the incumbent's leasehold, and that such functionary has a perfect right to object; he confesses also that he, when "afflicted with the Gothic mania," induced his father "to remove a monument from the chancel, in the same style as that he now proposed to erect, as being unsuited to a Gothic building;" he damages his cause, too, by calling the monument he has designed "Debased Pagan;" and yet he is so displeased by the judgment given against him by Dr. Tristram, Commissary-General of Canterbury, that he proposes to proceed by appeal to the Arches Court. In the little illustrated book he has published on the subject, he appears to place himself in an antagonistic position to everyone, even before he knows their opinions, as in the case of Mr. Street, the probable architect for the restoration of Chartham, who will not, we are sure, turn out or injure the monument of 1596. The brochure is nevertheless most interesting, and Mr. Moody's strictures on the ignorant pedantry of restoration, which is destroying the records of history in our churches, are admirable.

W. B. SCOTT.

IMPORTANT DISCOVERY OF ANCIENT BUDDHIST TEMPLES AND BUDDHIST INSCRIPTIONS BY MAJOR-GENERAL CUNNINGHAM.

THE following extracts from a Report presented to the Asiatic Society of Bengal by the Director-General of the Archaeological Survey of India, will show the extreme value of the discoveries lately made at Bharahut. Indian archaeologists owe already a large debt of gratitude to General Cunningham, but it is not too much to say that his latest excavations may inaugurate a new era in the history of Indian scholarship. In the sculptures and inscriptions of Bharahut we shall have in future a real landmark in the religious and literary history of India, and many theories hitherto held by Sanskrit scholars will have to be modified accordingly. Much depends, of course, on the date of these ruins, and here it is impossible to be too cautious. General Cunningham assigns them to the age of Asoka, 250 B.C., chiefly, it would seem, on account of the characters of the inscriptions, which are said to be the same as those found on the Sanchi stupa. But to fix the date of a building in India by the characters of the inscriptions is a matter of extreme difficulty. The letters used for the earliest Buddhist inscriptions soon acquired a kind of sacred character, and were retained in later times, just as in Europe the old style of writing is preserved on architectural monuments of a later age. With all respect for the learning of those archaeologists who unhesitatingly fix the date of any building in India by its architectural style, or by its sculptures and inscriptions, we sometimes wish that they might imbibe a little of that wholesome scepticism which Sanskrit scholars have acquired by sad experience. If, however, the date of the Bharahut ruins should prove beyond the reach of reasonable doubt, we should have in the sculptures and inscriptions there found a representation of what Buddhism really was in the third century B.C. As we find there the Jātakas, the legends of Buddha's former births, sculptured on walls, with inscriptions giving their titles and the names of the principal characters in each, we can no longer doubt that these stories formed part of the sacred literature of the Buddhists at that early date. It was

known from the *Mahāvanso* that the Jātakas, as well as the Nāga or fairy stories of the Buddhists, were used for architectural ornamentation, but it was not known that the custom was of so early a date. It would not follow, however, because certain Jātakas were known in the third century B.C., that therefore all the 550 belong to that early age. The fact, again, that an assembly presided over by Revata, is represented in the Bharahut sculptures, would in no way prove the historical character of the Second Council. According to tradition, Revata, who had seen Buddha, presided not only at the second Council, a hundred years after Buddha's death, but was present also at a third, a hundred years later, under the real Asoka. All this is legend; but whether we reject the Second Council altogether, or place it a hundred years after the traditional date of Buddha's death, 543–100, 443 B.C., or a hundred years after his real death, 477–100, 377 B.C., there would still be more than a hundred years between it and the date of the Bharahut buildings, an interval quite sufficient to account for the growth of many legends and myths connected with the early history of Buddhism. The Jātila Sabhā, represented on one of the sculptures, may be intended for the assembly of Kasyapa and the thousand Jātilas, mentioned in the *Mahāvanso*, p. 2. The names of the kings Ajātasatru and Prasenajit, are most important, and the occurrence of Rāma, Janaka Rājā, and Sitalā Devi, shows at how early a date these popular characters of the Brahmanic folk-lore of India found their way into the legends of the Buddhists. How full of valuable information these sculptured representations of ancient Hindu life will be, may be seen from the scene where Anāthapindika buys the Jetavana garden for Buddha. This was at Srāvastī, the capital of Prasenajit, King of Kosala. Anāthapindika offered to cover the ground with money, and the money, as represented on the sculpture, is square, not round. An important difference between the Sanchi sculptures and those of Bharahut is that instead of the startling nakedness of the former, the principal figures at Bharahut, both men and women, are decently attired. Does not this mark a different period in the history of Indian art?

MAX MÜLLER.

"During the working season which is just now closed, the greater part of the Central Provinces has been explored by my assistant Mr. Beglar and myself, he taking the Eastern half and I the Western half—the division being broadly marked by the high road through Jabalpur and Seoni to Nagpur.

"At Jabalpur we examined together the old temple at Bhera Ghāt, overhanging the marble rocks. The present temple is small, and apparently a re-construction of part only of the original building; but the circular colonnade which surrounds the temple, with its long line of female statues, all of life-size, is one of the most curious and perfect specimens of Hindu architecture that I have yet met with. The temple and its surrounding statues are dedicated to the worship of Siva; but from the discovery of a single small statue with the well-known Buddhist creed, *Ye Dhamma hetu, &c.*, inscribed on the pedestal, I have little doubt that this circular colonnade must originally have enclosed a Buddhist stupa. Each of the female statues has the name engraved on the pedestal, and from the shapes of the letters of these records I would assign the destruction of the Buddhist works and the establishment of the Saiva temple to the ninth or tenth century.

"But the most interesting remains are at *Bharahut*, six miles to the north-east of Uchahara, nine miles to the south-east of the Sutna railway station, and 120 miles to the south-west of Allahabad. In our maps the place is called *Bharad*, and I believe that it may be identified with the *Bardoolis* of Ptolemy. It is the site of an old city, which only sixty years ago was covered with a dense jungle. In the midst of this jungle stood a large brick stupa, 68 feet in diameter, surrounded by a stone railing, 88 feet in diameter and nine feet in height. The whole of the stupa has been carried away to build the houses of the present village; but rather more than half of the stone railing still

remains, although it has been prostrated by the weight of the rubbish thrown against it when the stupa was excavated. When I first saw the place, only three of the railing pillars near the eastern gate were visible above the ground, but a shallow excavation soon brought to light some pillars of the south gate, from which I obtained the measurement of one quadrant of the circle. I was thus able to determine the diameter of the enclosure, the whole of which was afterwards excavated, partly by myself and partly by my assistant Mr. Beglar. In many cases the accumulation of rubbish rose to eight feet in height, and as the stone pillars were lying flat underneath this heap, the amount of excavation was necessarily rather great; but the whole work did not occupy more than six weeks, and all that now exists of this fine railing is now exposed to view.

"This colonnade of the Bharahut stupa is of the same age and style as that of the great Sanchi stupa near Bhilsa. But the Sanchi railing is quite plain, while the Bharahut railing is profusely sculptured—every pillar and every rail as well as the whole coping being sculptured on both faces, with an inscription on nearly every stone. From the characters of these inscriptions, as in the similar case of the Sanchi stupa, the erection of the railing must be assigned to the age of Asoka, or about B.C. 250.

"The inscriptions are mostly records of the gifts of pillars and rails, like those of the Sanchi and other stupas. But there is also a considerable number of descriptive records, or placards, placed either above or below many of the sculptures. These last are extremely valuable, as they will enable us to identify nearly all the principal figures and scenes that are represented in these ancient bas-reliefs.

"Among the numerous sculptures at Bharahut there are no naked figures as at Sanchi and at Mathura, but all are well clad, and especially the women, whose heads are generally covered with richly-figured cloths, which may be either muslins, or perhaps brocades or shawls. Most of the figures, both male and female, are also profusely adorned with gold and jewelled ornaments, in many of which one of the most significant Buddhist symbols plays a prominent part. The earrings are mostly of one curious massive pattern which is common to both men and women. The *ankus*, or elephant goad, was also a favourite ornament, which is placed at intervals in the long necklaces of ladies.

"At each of the four entrances the corner pillars bore statues, each $4\frac{1}{2}$ feet in height, of *Yakshas* and *Yakshinis* and of *Naga Rajas*, to whom the guardianship of the gates was entrusted. Thus at the northern gate there are two male figures and one female, which are respectively labelled *Ajakāla Yakho*, *Kupiro Yakho*, and *Chadā Yakhi*—that is, the *Yakshas* named *Ajakāla* and *Kupira* and the *Yakshini* *Chadā*. Other *Yakshas* are named *Suviloma*, *Virudaka*, and *Gangito*, and a second *Yakshini* is labelled *Yakhini Sudasana*. On two other pillars there are male figures, each with a hood canopy of five snakes' heads and each labelled *Naga Raja*. These have their arms crossed upon their breasts in an attitude of devotion appropriate to their appearance on a Buddhist building. On two middle pillars there are two female statues respectively labelled *Chukaloka Devatā* and *Sirinā Devatā*, whom I take to be goddesses.

"Amongst the scenes represented there are upwards of a dozen of the Buddhist legends called *Jātakas*, all of which relate to the former births of Buddha. Luckily these also have their appropriate inscriptions, or descriptive labels, without which I am afraid that their identification would hardly have been possible.

"Of illustrations of the life of Buddha during his last appearance there are some good examples. The earliest of these is a medallion containing Māyā's dream of the white elephant, which is superscribed *Bhagavato Ukdanti*. A second scene belongs to the reign of *Ajāta Satru*, King of Magadha, in the eighth year of whose reign Buddha attained *Nirvāna*. This is labelled—

"*Ajātasata Bhagavato vandate*.—Some of the well-known assemblies of the Buddhists would also appear to be represented, of which one is called the *Jatila Sabha*, of which I know nothing. A second belongs, I think, to a later period of Buddhist history, about midway between the death of Buddha and the reign of Asoka. This sculpture represents a large assembly, and is duly labelled—

"*Sudhamna Reva Sabha Bhagavato Chudā Mahā*.—The words *Reva Sabha* I take to mean the assembly

or synod which was presided over by the famous Buddhist priest Revato just 100 years after the death of Buddha, or in B.C. 378.

"But the Bharahut sculptures are not confined to the legends and events connected with the career of Buddha, as there is at least one bas-relief which illustrates a famous scene in the life of Rāma. In this sculpture there are only three figures, of which one seated to the left is holding out an arrow towards a male and female who stand before him—the latter being behind the other. These figures are labelled respectively *Rāma* (the rest lost, but most probably *Chandra*), *Janaka Rāja* and *Sitala Devi*. I believe that this is by far the earliest notice that we possess of the great solar hero Rāma and his wife.

"But perhaps the most curious of the Bharahut sculptures are a few scenes of broad humour, with elephants and monkeys as the only characters. In two of these an elephant has been captured by a band of monkeys, who have fastened a billet of wood along the inside of his trunk so as to prevent him from moving it. Ropes are fastened to his neck and body, the ends of which are pulled by monkeys, who are walking and dancing in triumphal procession to the sound of shells and cymbals played by other monkeys. The spirit of these scenes is very droll. A third scene represents the monkeys holding a giant by the nose with a pair of pincers, to which is fastened a rope dragged by an elephant. The action and attitudes of the monkeys are very good. The intention of all these designs is exceedingly spirited, but the execution is coarse and weak.

"In the short inscriptions on the railing of the Bharahut stupa I find the names of the following places, *Sugana*, or *Srughna*; *Vedisa*, or *Bhilsa*; *Pataliputra*, or *Patna*; *Kosambi*, or *Kosam*; *Nandinagara*, or *Nander*; and *Nāsika*, or *Nāsik*; besides a number of unknown places, of which *Asitanasā* is most probably some town on the river *Tamasā* or *Tamas*, the Tons of our maps.

"From these inscriptions also I have learned the names of several parts of the Buddhist gateways and railings, one of which is a new word, or at least a new form of word, not to be found in the dictionaries.

"*Bharahut*.—A further examination of the inscriptions, and the receipt of Mr. Beglar's report of the completion of the excavations, have made several very valuable additions to my account of the *Bharahut* sculptures, of which I will now give a brief description.

"A bas-relief, labelled with the name of *Pasenajita*, shows the well-known King of Kosala in a chariot drawn by four horses proceeding to pay his respects to the Buddhist Wheel symbol, which is appropriately named *Bhagavato dhamma cakam*.

"There are also representations of five separate *Bolhi Trees* of as many different Buddhas, which are distinctly labelled as follows:—

- (1).—*Bhagavato Vipasino Bodhi*, that is, the Tree of *Vipasyin* or *Vipasvi*, the first of the seven Buddhas.
- (2).—*Bhagavato Kakusadhasa Bodhi*.
- (3).—*Bhagavato Konagamans Bodhi*.
- (4).—*Bhagavato Kasapaka Bodhi*.
- (5).—*Bhagavato Sakamunino Bodhi*.

These last are the four well-known Buddhas named *Krakuchhanda*, *Konagamani*, *Kāsyapa*, and *Sākya-muni*.

"But by far the most interesting of all Mr. Beglar's discoveries is a bas-relief representing the famous *Jetavana* monastery at Srāvasti. The scene is labelled *Jetavana Anādhapediko dātī koti santhātana ketā*, which I take to mean that 'Anādhapika buys (ketā) the Jetavana for certain *kotis* of money.' To the left there is a building labelled *Kosambikutti*, a name which has already appeared in my Srāvasti inscription. A second building near the top is labelled *Gadhakuti* or *Gandhakuti*. In the foreground there is a cart which has just been unladen, with the pole and yoke tilted upwards, and the bullocks at one side. The story of the purchase of Prince Jeta's garden by Anāthapindika for eighteen *kotis* of *masurans* is told in Hardy's Manual of Buddhism. According to the legend Prince Jeta, not wishing to sell the garden, said that he would not part with it for a less sum than would pave the whole area when the pieces of money (*masurans*) were laid out touching each other. This offer was at once accepted by Anāthapindika, and accordingly the courtyard is represented covered with ornamented squares, which touch each other like the squares of a chess board, but do not break bond as a regular pavement of stones or tiles would do. For this reason I take the squares

to represent the square pieces of old Indian money. Beside the cart there are two figures with pieces in their hands. These I suppose to be Anāthapindika himself and a friend counting out the money. In the middle of the court are two other figures also with square pieces in their hands. These I suppose to be the purchaser's servants who are laying down the coins touching each other. To the left are several persons of rank looking on, whom I take to be Prince Jeta and his friends. The whole scene is very curious; and when we remember that the bas-relief is as old as the time of Asoka, it does not seem too rash to conclude that we have before us a rude representation of the buildings of the famous *Jetavana* which were erected by Anāthapindika during the lifetime of Buddha."

THE CONGRESS OF THE ROYAL ARCHAEOLOGICAL INSTITUTE AT RIPON.

THE annual Congress of the Institute was opened at Ripon on Tuesday, July 21, and resulted in a most successful gathering. The temporary museum was under the supervision of the Rev. W. C. Lukis, M.A., rector of Wath; the conduct of the excursions was undertaken by Mr. Fairless Barber, President of the Yorkshire Archaeological and Topographical Association. The proceedings were formally opened on the Tuesday, at 1 p.m., when the Mayor and Corporation of Ripon received the Institute in the Town Hall. The Most Noble the Marquis of Ripon, who had kindly consented to accept the presidency of the meeting, introduced the president, Lord Talbot de Malahide, and the officials, and suitable speeches were made; after which, the company adjourned to the Flower Show Field, where a luncheon had been provided by the Mayor and Corporation. At 3 p.m. the Minster was visited; a lecture was delivered by Sir G. Gilbert Scott, R.A.; after which the Rev. J. T. Fowler, Vice-principal of Bishop Hatfield's Hall, Durham, explained the curiosities of the cathedral library, his discourse being supplemented by some remarks from the organist, Mr. E. J. Crow, Mus. Bac. Cant., on two ancient musical compositions, supposed to be by Henry VIII., recently discovered there. The choir illustrated what was said. Ailey Hill, the Chapel of St. Mary Magdalene, and the Maison de Dieu were next visited; and in the evening the noble President delivered his inaugural address at the Riding School, dwelling chiefly on his sense of responsibility as the owner of Fountains Abbey. On Wednesday, at 10 a.m., a meeting was held in the Riding School, when the following papers were read:—"On Ripon College," by Edward Hailstone, Esq., F.S.A., and "On Monastic Buildings of the Cistercian Order," by Edmund Sharpe, Esq., M.A. At 12.30 p.m., an excursion was made to Markenfield Hall, which was explained by Mr. J. H. Parker, C.B., F.S.A.; and to Fountains Abbey, where a luncheon was offered to the members of the Institute by the Marquis of Ripon. The ruins were described and explained by Mr. Sharpe; and at 9 p.m. a conversazione was held in the Museum. Thursday was devoted to an excursion to Richmond and Easby Abbey; the Institute was entertained by the Mayor, and the main speakers were Mr. G. T. Clark, F.S.A., and Mr. Sharpe. In the evening a reception was held at Studley Royal by the Marchioness of Ripon. On Friday, July 24, the meeting of sections was held at 10 p.m.; papers were read "On some Ancient Sepulchral Remains discovered at Ilkley, May 8, 1874," by E. Sewell, Esq., M.A.; and "On the Archaeology of Ripon," by Professor Stubbs; and an eloquent tribute to the memory of the late Mr. Albert Way was delivered by the Hon. President of the Institute. At 12.30, p.m. the recent Roman discoveries at Castle Dykes were visited, and explained by Rev. W. C. Lukis; after which the Institute proceeded to Tanfield Church and Castle, to Snape Castle, and to Bedale Church; a handsome collation being provided by Mr. James Pulleine, of Clifton Castle. Saturday was occupied by excursions to Bolton Castle, the scene of Mary Queen

of Scots' attempted escape, which was explained by Mr. Parker, C.B.; to Wensley Church, where Mr. M. H. Bloxam, F.S.A., described the Scrope monuments; to Middleham Castle, where luncheon was provided, and an able discourse delivered by Mr. G. T. Clark, F.S.A. The feature of the day, however, was a visit to Jervaulx Abbey, which was described by Mr. Sharpe. On Sunday morning a sermon was preached, in the Minster, to the members of the Institute, by the Very Rev. the Dean of Ripon. On Monday, July 27, Byland Abbey was visited, under the guidance of Mr. Sharpe, who also conducted the Institute to Rivaux; after which Helmsley Castle was reached, where Mr. G. T. Clark undertook the conduct of the meeting, and luncheon was provided by Lord Feversham; the excursion was wound up at Gilling Castle, where the meeting was received by the proprietor, Mr. Barnes. At 9 P.M. a conversation was held in the museum, and some interesting remarks delivered by Rev. W. J. Loftie, Assistant Chaplain of the Savoy Chapel, on the valuable collection of manuscripts exhibited by Mr. Bragge, of Sheffield, Colonel Brooke, and others. Addresses were also delivered by Mr. Bloxam, Rev. J. T. Fowler, Rev. W. C. Lukis, and others. The Congress was virtually brought to a close on Tuesday, July 28, by a meeting of the Historical section, in the Town Hall, when a memoir was read on "The Incursions of the Scots into Yorkshire in the Fourteenth Century," by Joseph Bain, Esq., F.S.A.Scot. In the afternoon a special festival service was held in the Minster, the musical portion being undertaken by the united choirs of Ripon, Manchester, and Durham. A special visit was made to York on Wednesday, July 29, in union with the Yorkshire Archaeological and Topographical Association, under the guidance of Mr. G. T. Clark.

B. MONTGOMERIE RANKING.

NOTES AND NEWS.

THE subjects for competition selected by the Belgian Academy of Archaeology are: 1. The history of the typographic establishment at Antwerp of Plantin and his successors. 2. The history of Romanesque sculpture in Belgium. 3. An archaeological or historical paper relative to the ancient principality of Liège, the choice of subject being left to the writer. The papers are to be written in French, and, in addition to the prize of 500 francs, the Academy will give a medal to each successful candidate, with fifty copies of his memoir.

THE French papers announce the death of M. Rio, the philosophic and poetic author of *Art Chrétien*. He died at the age of seventy-seven.

THE Russian painter, Michel de Zichy, has, it is stated, quitted St. Petersburg, and means to establish himself in Paris.

THE historical painter, Peter Janssen, of Düsseldorf, has received a commission to paint in fresco one of the galleries of the National Museum of Berlin. The subject chosen for representation is the myth of Prometheus, which the artist proposes to set forth in one large and nine small wall paintings. It is, no doubt, owing to the success of Janssen's wall paintings in the Rathhaus of Crefeld that he has been entrusted with this new commission. There are not many artists who can venture to undertake such works. Bendemann, it is stated, will paint another gallery, in conjunction, it may be supposed, with his pupils; but the subject to be dealt with by him is not as yet known. Both these galleries are destined for the reception of cartoons by Cornelius.

THE candidates for election into the French Academy in place of M. le Vicomte Henri Delaborde, now perpetual secretary, were M. Vinet, librarian of the Ecole Nationale des Beaux-Arts; M. Louis Viardot, M. Alfred Michiels, both known in art literature; M. le Comte Etienne de Cardaillac, Director of civil and national build-

ings, and Minister of Public Works; M. Elwart, professor of harmony at the Conservatoire de Musique; M. Théodore Gruyer, inspector of fine arts; and M. Emile Perrin, administrator of the Comédie Française, and municipal councillor. M. Viardot, however, after sending in his letters, withdrew his candidature. After six ballots, M. de Cardaillac was the successful candidate. A rumour had been spread by some of the French papers that the Baron de Rothschild was likely to be elected Academician in the place of the Vicomte Henri Delaborde, but his name did not appear in the list of candidates.

M. DE CHENNEVIERES is making arrangements for carrying out the decoration of Ste. Geneviève. MM. Gérôme, Gustave Moreau, and Chenavard have declined the Director's commissions, and M. Humbert undertakes the two compositions assigned to the first-mentioned artist—the "last moments of the aged Saint," and "St. Clotilde having her husband's remains laid in the tomb of Clovis"—M. H. Lévy will decorate the Lady Chapel in the place of M. Moreau, and M. Matout, a pupil of M. Chenavard, undertakes the painting of "Christ showing in a vision to the angel of France the destinies of its people," which is to adorn the apse.

AMONG some objects sold on Thursday week at Messrs. Foster's, in Pall Mall, a small 12mo volume, described as Queen Elizabeth's *Book of Prayers*, with some twenty pages written on vellum, and on the inside of the cover two miniatures, one being a portrait of Elizabeth, sold for 335*l.*; an antique book of the Sacrament, repoussé silver cover, 35*l.*; an agate snuffbox, with two miniatures attributed to Zincke, 165*l.*; two old Breguet watches, 77*l.*; an old English repeater, by Thomas Mudge, 45*l.*; the Order of the Garter, in enamelled gold set with diamonds, 210*l.*

LAST week's *Saturday Review* contains an article on Collections, which one may read on an idle afternoon after lunch, though the writer does not tell collectors anything they do not know already, as to the pleasures, risks, gains, and various circumstances of their pursuit, and does not tell the general reader, who is not a "collector," anything which the general reader, if he have only common sagacity, may not easily discover for himself. More than this, the writer is, we think, mistaken (or, at the least, may easily seem to be) when he says, in referring to the pecuniary result of the pursuit, "the true collector must not buy what is now the fashion." The phrase "the fashion" is a loose one, and all depends upon the sense in which we take it. It would have been more correct to have said, "the true collector must not buy what is now immensely popular." An illustration will serve. Wilson, who catalogued Rembrandt's prints in 1836, no doubt considered that amongst collectors they were then "the fashion." But how would it have been if Rembrandt-collectors of that time had read in the *Saturday* that they must not collect "what is now the fashion," and so had eschewed Rembrandt? What is now the fashion can become more the fashion. Now and then a collector may invent a fashion, as the *Saturday* suggests, and profit by it; but we imagine that the safest course is a less speculative one. It is safest to buy good art, even when good art is fashionable, for good art is sure in the long run to increase in value. The good art of Rembrandt's etchings—to continue the instance we were giving—is worth a dozen times more, now in the open market, than forty years ago; and no one who bought, forty years ago, prints which were not then "the fashion" has made better use of money than have those who, in buying Rembrandt, bought that which even their own generation valued very much.

HUGHENDEN Church, Bucks, in the park of Mr. Disraeli, is, we hear, to undergo the process of restoration. The edifice, which dates from 1100, has been for some time in a hopeless state of dilapidation; but there are some very perfect

Norman windows in it, and the southern doorway is pure Norman work of the earliest type. The estimated cost of restoration is 5,000*l.*

IN the *Builder* of July 18 will be found a full-page view of the design made by Lieut. H. H. Cole, R.E., for the National Training School of Music at South Kensington. This building, the first stone of which was laid in December, 1873, is rapidly rising from its foundations, but it probably will not be finished for another eighteen months. It is built in what the architect terms the "Old English style of the sixteenth century, when large windows and plaster ornament prevailed;" but the plaster ornament in this case has more the character of Italian Renaissance than of English Perpendicular architecture. The art of sgraffito, or cutting in plaster, is much extolled by Lieut. Cole as a means of supplying at a moderate cost a mode of elegant and graceful decoration, but whether it is for want of "sound principle" in its application or skill in execution, certain it is that plain brickwork is generally far more satisfactory in its unadorned ugliness than when covered with this pretentious style of ornamentation. Mr. F. W. Moody, of the South Kensington Museum, has designed and will carry out, it is stated, the sgraffito panels and frieze on the exterior, a fact that fully accounts for their Italian style.

The idea of a National Training School of Music originated with the Society of Arts, but the carrying out of it is due to the liberality of Mr. C. J. Freaque, who, when funds were wanted for its erection, undertook to build it at his own cost and risk, and to grant the free use of it for five years to the nation.

THE *Nile* states that a party of Egyptian staff-officers, while on a surveying expedition near Berenice on the Red Sea, lately discovered in lat. 24° an ancient fortress built on a height, about 150 feet above the sea-level. Several Greek inscriptions, found on the spot, were sent to the museum at Boulak and have since been deciphered. According to these inscriptions it would appear that the fortress was built by Ptolemy Euergetes, son of Ptolemy Philadelphus. The walls are in very good preservation and the whole edifice is said to be a remarkable monument of the perfection attained under the Ptolemaic dynasty in the science of fortification.

THE *Levant Herald* remarks that a gratifying sign of the times in Turkey is that it is no longer considered a religious duty to break up the statues and other remains of ancient sculpture which are frequently brought to light by the pickaxe and the plough. The spirit of the fierce old iconoclasts of Arabia has died out, and what is a more striking evidence of the influence of modern refinement, the destruction of antiques is forbidden under judicial penalties. Even in the remote province of Tripoli in Barbary such objects are now respected, and we find the native journal of that vilâet hazarding conjectures as to the precise divinity represented by a beautiful female statue which was recently discovered in perfect preservation near the village of Lebda. The statue was brought to the town of Tripoli, and is now probably on its way to the museum of Stamboul. The Turkish paper adds that similar discoveries are common at Lebda, a name which, it says, is probably a corruption of Leptis, the birthplace of Septimius Severus.

THE well-known German painter, Christian Griepenkerl, is at present engaged in decorating the walls of the Museum of Arts, known as the "Augusteum," in his native town, Oldenburg. Art critics speak with enthusiastic admiration of the originality of design and harmony of colouring shown in the series of these frescoes, which represent the myth of Prometheus, while they give nearly equal praise to the ceiling, on which the artist has grouped the geni of Nature and Art around Venus-Urania, whose majestic figure con-

stitutes the central form towards which all others seem to tend. Griepenkerl, who is strongly imbued with the mingled transcendentalism and sensuous impressibility which form so striking and interesting a combination in the nature of the Frisian race, to which he belongs, may be characterised as the favourite of the world of German millionaires specially, and of the upper ten thousand generally. The strange mingling of the richest ideality of conception with a somewhat cold middle-toned colouring, perceptible in his works, impresses one with the sense of a nature in which a certain form of self-consciousness and enforced reticence are holding in check the exuberance of the fancy, and herein seems to lie a subtle charm for the masses who constitute the patrons of modern art, for few palaces or villas belonging to the great and rich of the Austrian Empire are built or restored in these days without bearing some evidence of Christian Griepenkerl's facile and many-sided mastery of decorative art.

GRIEPENKERL's studio in the Theresianumgasse at Vienna is a faithful reflex of the learning, art, and tastes of the painter, and is artistic in every detail of its appointments. But in open disregard of expense, and in the realisation of æsthetic cravings for the beautiful at any cost and under any conditions, which are daily becoming more and more characteristic of a certain class of decorative painters in Germany, it cannot compare with that of Joseph Neugebauer, who to the habits of a recluse and a scholar rather than of a man of the world, and to the exterior of a simple German citizen, adds the love of harmony and richness in colour, and the hungering craving for the beautiful that seem to belong more to the days of ancient Herculaneum than to modern Vienna. Few living German artists can boast of such versatility of gifts as Neugebauer; and had he not been a painter, he would probably have ranked among the great composers of his native country, music seeming with him to be scarcely less his forte than the sister art of painting. As an artist he may be said to be equally successful in his portraits, altar-pieces and Madonnas, and his classical studies, and true to his artistic instincts, his house reflects at every turn his own strongly-marked and varied æsthetic nature. Not a wall, ceiling, door panel, sill, or plinth is there that does not betray the master's hand, whose skill and industry were able, within fourteen days, to complete a fresco of Night and Morning on the ceiling of one of the principal rooms, which is in itself a gem of art. Surely, with such masters as Griepenkerl and Neugebauer, Vienna may well lay claim to the foremost place in the van of modern decorative art.

THE first thing that strikes attention in the *Zeitschrift für Bildende Kunst* this month is one of Leopold Flameng's skilful reproductions of Rembrandt. No modern etcher can compare with Flameng in his understanding of the great Dutch master's mode of working, but even he misses at times the force and spirit that animate all Rembrandt's works. The copy looks dead beside the living original. The etching in this instance is from a portrait of a grand old Jew in the Suermondt Gallery. We are grateful for it, but imagine that the eyes would have looked out at us with more recognition had Rembrandt etched it himself. Another bold and striking etching by J. Klaus in the same number is interesting, not only from its own merits, but because it reproduces the work of a little-known but excellent master. The individuality of Bernhard Fabritius was first re-established by Bürger, who, in his *Musées de la Hollande*, gave a short notice of some of his works. He appears to have been a pupil of Rembrandt's, but, like several of Rembrandt's pupils who copied his style, he had considerable original talent. The portrait etched by Klaus is of a handsome man in the dress of a shepherd, the original of which is in the Royal Academy of Vienna. As the literature in the number we find: 1. Third

article on the Suermondt Collection, by Dr. Woltmann, dealing especially with Rubens and Van-dyck, Franz Hals, Rembrandt, and the Dutch portrait painters; 2. The conclusion of Rudolf Reddenbacher's "Contributions to the History of the Building of St. Peter's at Rome," with plans of Giuliano da San Gallo, Raphael, Antonio da San Gallo, Peruzzi, and Michael Angelo; and 3. An interesting account, by Moritz Thausing, of the Hüsgen collection of Dürer's prints, lately bought by the Vienna Academy. With this collection has been always preserved a lock of Dürer's hair that can be traced through the hands of various owners in unbroken succession up to the painter Hans Baldung Grün, for whom it was cut off two days after Dürer's death. This lock has now passed, with the rest of the collection, to the Vienna Academy, and is preserved in the library.

THE third Russian Archaeological Congress is to meet at Kiew on the 14th instant, and will sit for about three weeks. The first Congress took place at Moscow in 1863, and the second three years later at St. Petersburg. An exhibition of Russian and Slavonic antiquities, and some prehistoric cemeteries near Kiew, will be open to the public during the sitting of the Congress, and excursions are being organised to visit both banks of the Dnieper. The Congress will be divided into eight sections:—(1.) Prehistoric antiquities; (2.) Slavonic history, geography, and ethnology; (3.) Russian arts and industry; (4.) Social and domestic life of the Russo-Slavonic peoples; (5.) Religion; (6.) Russian and Slavonic literature; (7.) Classical, Byzantine, and West-European antiquities; (8.) Oriental antiquities.

ALL who are interested in the elucidation of the history of the Renaissance movement in Germany will be glad to learn that Dr. Wilhelm Franck, acting on the suggestion of Dr. Lübke, has given his countrymen the results of his knowledge of the archaeological and architectural remains of the districts with which he was locally connected. In a work on the origin and development of the Renaissance in the Hessian Provinces, Dr. Franck has been able to adduce numerous evidences of the application of these newer principles of art in the districts of the Odenwald and other parts of Hessian Germany, at a much earlier period than any recorded by Dr. Lübke in his valuable history of German Renaissance. Dr. Franck has discovered an entablature over the entrance gate of the castle of Breuberg, in the Odenwald, bearing the arms of the Counts of Wertheim with the date 1490, and surrounded by a wreath, the whole being enclosed within a columnar setting similar in character to the decorations of the Wratislav hall at Prague, but unlike any other specimens of ornamentation to be met with in other parts of Germany at so early a period. He has also found at Mayence the remains of a sacramental shrine behind the high altar of St. Stephen's Church, which bears the date 1500, and is enclosed in a splendid iron grating in pure Renaissance style, as are also four columnar candelabra, dedicated, according to the inscription, by the canons of the church in 1500 to the use of St. Stephen's altar. Mayence also contains a monument bearing the date 1514, and erected to the Electoral Prince-Primate Uriel von Gemmingen, which, in all its details of elegant accessory ornamentation—the position of the archbishop, who is kneeling between two bishops within an elaborately-decorated columnar niche, and the form and style of the pedestal—marks most distinctly the transition from the Gothic to the new style. Dr. Lübke had been under the impression that the Jews' Fountain, erected by the Elector Albert II., in 1526, to commemorate the battle of Pavia, was the oldest evidence of Renaissance art at Mayence, and in the Rhineland generally.

THE STAGE.

LADY TEAZLE.

AMONG the greatest of the prints after Sir Joshua, is one of Mrs. Abington as the Comic Muse. With head slightly inclined, as in an interval of rest, she stands, neither too erect to be easy, nor too lounging to be graceful. The dropped hand at her side holds the discarded mask, and all the figure rests, from its hair-crowned head to where the foot is seen below the edge of figured gown; while the face surveys with unconcern an imaginary audience fascinated erewhile by the exercise of charm and art. There is a smaller print of Mrs. Abington as Roxalana in a now forgotten play, *The Sultan*. The Sultan is enamoured, and well may be, for here the whole face is alive with expression and activity. Thought and vivacity have made the face beautiful, and such a change says much for the capacity of Mrs. Abington's art. The lady is now forgotten as Roxalana, but deserves to be remembered as the first Lady Teazle.

Lady Teazle has always been a favourite character with English actresses of comedy, from the night, in 1777, when the part was played at Drury Lane, to the night, last week, when it was played at the Olympic by Miss Cavendish, whose elegant, though probably not altogether satisfactory performance suggests an occasion for these remarks. Mrs. Abington first made the character famous. It was played probably by nearly every actress who aspired to high rank in comedy, during the succeeding ninety years. Fifty years since Miss Kelly's interpretation of it formed the subject of debate. Play-goers scarcely yet middle-aged have seen it acted by Mrs. Stirling and Miss Sedgwick; and the most recent frequenters of the London theatres are familiar with its performance by Mrs. Kendal, Miss Amy Fawcett, Miss Cavendish, and Mrs. Bancroft—in a word, by nearly all of our actual actresses of comedy who claim to be not only actresses but artists. The representation of Lady Teazle is like an early proposition in Euclid. It is a bridge which nearly every one must cross.

But of all the artists who have crossed this bridge, how little trace remains! Criticism has probably dealt too little in detail: it has been too little analytical. For all description, stage histories present us with a few vague adjectives, which cannot possibly suggest to us the idea of a character. What was the Lady Teazle of Mrs. Abington? Not, I dare swear, the wholly courtly personage, with the conventional elegance of the Pantheon and Bath Pump Room, whom one actress of high intelligence has lately chosen to present (though indeed Miss Cavendish, with all her courtly grace, has wisely sought to retain something of the young wife's freshness of pleasure in a great world which is new to her); nor, I dare swear, the wholly rustic damsel whom Miss Kelly, fifty years since, thought herself successful in embodying; nor even that compound of rustic simplicity and serious feeling which Mrs. Bancroft shows you, in Tottenham Street, to-day. These representations would appear to be somewhat one-sided. They are not founded on any conception of the character as a whole. Perhaps they are too much founded on the personality of the actress herself—often the great word "a conception" is bestowed upon that which is purely an accident. It is readiest to "conceive" of such a character as you yourself are most capable of embodying; and this or that new light thrown upon a part by a new exponent of it, is, much oftener than it is quite civil to avow, only the result of the new actress's inches, or her slimmess, or her stoutness, or the *timbre* of her own natural voice. You are bidden, now and again, as a favourite player takes up for the first time a famous part—you are bidden to watch, with keen intellectual interest, the issue of the experiment, of which the result really depends upon all sorts of natural limita-

tions, or natural gifts, which you know pretty well beforehand. There is an affectation in all this.

But, be this as it may, one exponent lays hold of a particular passage, and one lays hold of another, and though no exponent is without her own merit, the success is rarely complete. "I have made you a woman of fashion," says Sir Peter to his wife; and Miss Ada Cavendish remembers the saying. "My daily occupations to inspect the dairy, superintend the poultry, make extracts from the family receipt book, and comb my Aunt Deborah's lapdog"—that is what Miss Kelly particularly remembered, and it has been remembered by Mrs. Bancroft, who has also recollected—and it is this which gives such unusual seriousness to her last scene—"I behold him now in a light so truly despicable that I shall never again respect myself for having listened to him." Why torture a meaning out of these sentences so much?—why even take them quite *au pied de la lettre*?—especially when you must recollect that they were spoken by a generation which used great words as we use slang—which "protested," if it really barely surmised, and was always "prodigiously" happy when it was tolerably cheerful. Yes, Lady Teazle was "a woman of fashion," because to be Sir Peter's wife was of itself to be "a woman of fashion." Yes, Lady Teazle would "never again respect herself"—until the day after to-morrow, when she would respect herself very much.

I have not seen Mrs. Kendal's performance, which, whether on the whole it fail or succeed, is sure to offer suggestions of genuine value; but of those which one has had the frequent opportunity of seeing, Miss Amy Fawsitt's seems to be the preferable, and this may be said without claiming for that actress the credit of any subtle "conception." But the Lady Teazle, which, as I imagine, she somewhat spontaneously presents, has the qualities of liveliness and light simplicity which come out the most, I think, as one reads the play—they come out more than fashion, more than actual rusticity, and more than profound contrition. Here is the chatterbox who revels in the gaiety of the town; whose merriment is at the root of her carelessness about money; who when she says an ill-natured thing, says it "out of pure good humour;" who perceives that there is something outwardly rather ridiculous in her union with the punctilious gentleman who was a bachelor at fifty; who is therefore mutinous, when he undertakes to command, yet submissive when she has mutinied too much—who feels for the moment "the shame of this discovery," but even then, unconscious of cherishing any dreadful intentions, is far more indignant with Mr. Surface than overwhelmed for herself.

Perhaps it may be a mistake to search for hidden meanings in such a part as this of Lady Teazle's. The meaning lies upon the surface; but on the surface of *the whole*. Lady Teazle, it appears, is no exceptional character; nor does she demand from her representative any long-considered refinements or subtleties beyond the reach of a school-girl. A little common sense, content for once with its own commonness—high spirits, if you will: at all events, no lack of laughter—and the knowledge how to deliver, pointedly, dialogue the very point of which makes its delivery easy, unless one is wholly out of cue with it—that, and little else, is required for the presentation of a stage character of whose good looks or bad looks not a word, I think, is said in the play (though, as Sir Peter was so long in choosing, it is to be hoped that he chose wisely after all):—that, and little else, is required for the presentation of a character never very profoundly studied by its creator. The bright talk, not the individuality, was Sheridan's preoccupation. He laboured on the part for years, but it was always the witticisms of his heroine, and not her deeds, he cared about. Merry and simple, rather than subtle, she

was made broadly true to a large class—not to an individual. Her very truth was probably a secondary thing, save in so far as she had to be broadly true just that on the stage she might be supremely effective.

FREDERICK WEDMORE.

The Sphinx is to be presented in an English dress. Mdlle. Beatrice, an Anglo-Italian actress much esteemed in the provinces, and deserving, say some of her admirers, to be much esteemed in London, has secured the right of representing it; and she has taken the Haymarket Theatre for six weeks from the end of August, and will there present *The Sphinx* to a London audience. She will herself enact the part of Blanche, rendered famous, it must be remembered, much less by the talent of M. Feuillet than by the power of Mdlle. Croizette; and a Miss Moodie—is it the lady who played in the *White Pilgrim* at the Court?—is engaged to enact the part of Berthe, which at the Théâtre Français enjoyed the advantage of the art and grace of Mdlle. Sarah Bernhardt.

THE Princess's Theatre reopens to-night, with an old and well-known melodrama, *Janet Pride*. The chief interest in the performance is likely to be that caused by the resumption of his original part by Mr. Benjamin Webster, though players no less efficient than Mrs. Mellon and Mr. Belmore will take a share in the representation.

WE hear that several important engagements, necessitated by his intention to produce *Hamlet* in the autumn, have been made by Mr. Bateman for the Lyceum Theatre.

A NEW theatre has just been opened at Margate, and Mr. Charles Matthews is playing there.

MR. AND MRS. ROTSBY have been acting in Edinburgh.

MISS ADA CAVENDISH is about to leave town for the provinces.

DURING the last nights of *Clancarty* at the Olympic Theatre, Miss Marion Terry is playing the part "created" by Miss Emily Fowler.

THE little Charing Cross Theatre is being made a little larger, and in September next it will be opened by Mr. Alexander Henderson, formerly of Liverpool, who will re-introduce to the London public that old favourite, Miss Lydia Thompson.

THE Opéra Comique, in the Strand, will close its doors on Saturday next, and the original representatives of *Giroflé-Girofla* will go elsewhere.

THE twelfth of August is the day fixed for the first representation of the new act of *Orphée aux Enfers* which Offenbach has been some time preparing.

IN a recent performance of *Les Femmes Savantes* at the Théâtre Français, M. Delaunay was admired a good deal as Clitandre, and it was recognised that both the good qualities and the defects of Mdlle. Nathalie aided her to achieve a perfect representation of Philaminte. M. Got was Trissotin: Mdlle. Jouassain was Belise, and Mdlle. Tholer was Henriette. "Her acting was such," writes a correspondent, "that the character became first insignificant; then disappeared altogether." And M. Sarcey no less boldly proclaims that Mdlle. Tholer is "one of the errors of the management." "They put her everywhere—she pleases me nowhere," he exclaims with his characteristic frankness.

TO WIN the praise of this notable M. Sarcey is now one of the highest ambitions of a Parisian actress. In the stalls they talk of his criticisms. In society they talk of them. The question is not what "the papers" say, but "Sarcey—a-t-il fait son éloge?" Mdlle. Sarah Bernhardt is, and deserves to be, the object of his frequent praise; but this week he has been pleasant to Mdlle. Dinah Félix—an actress not often put into positions of great prominence. Sarcey has found a little fault with Mdlle. Dinah

Félix's performance of Martine in *Les Femmes Savantes*:—

"Mais je dois ajouter," he says, "que quelques jours auparavant elle nous avait représenté la Dorine du *Tartuffe* avec une autorité merveilleuse. Je n'ai jamais entendu dire les longs couplets du premier acte, qui sont si difficiles, avec plus de variété et de finesse dans le débit. Le premier acte effrayait toujours beaucoup, dans le temps, Mdlle. Augustine Brohan, qui ne se résolvait qu'avec beaucoup d'appréhension et de peine à jouer Dorine: je ne lui ai pas vu prendre ce rôle trois fois en dix ans. C'est un peu la faute de Molière. Quelque respect qu'on sente pour le *Tartuffe*, il faut bien avouer que les tirades que l'auteur a mises au premier acte dans la bouche de Dorine, ne sont pas à leur place; et c'est ce qui les rend si malaisées à dire. Il paraît que dans sa première version, Molière les avait données à Elmire; nous ne savons pourquoi il ne s'y est pas tenu."

A FRENCH edition of Manzoni's plays and poems has just been published by Charpentier. He is known to most of us as the author of the only Italian novel that people are ever recommended to read. His two first tragedies—*Carmagnola*, which appeared in 1819, and *Adelphis*, which appeared in 1823—were, it is asserted, the first attempts of any Italian poet to revolt against the rules of the classic theatre. In France, as in Italy, they attracted attention, and Manzoni wrote to one of his critics—M. Chauvet—a letter in which he elaborately justified himself for his position of revolt. The second of his two tragedies is esteemed to be the finer.

MUSIC.

Goethe and Mendelssohn (1821–1831). Translated, with Additions, from the German of Dr. Karl Mendelssohn-Bartholdy by M. E. von Glehn. Second Edition. (London: Macmillan & Co., 1874.)

THE childhood of eminent men has always been a favourite subject; and nothing is more natural than the interest which attaches to the early years of those who in after life have become famous. A valuable collection of sketches of the boyhood of distinguished musicians might easily be made; and while in some cases it would be seen that during the period of youth but little promise was given of subsequent achievements, in the large majority of instances it would be found that "the boy was father to the man." Handel, at the age of seven years, stealing off to the organ loft, and with fear and trembling venturing to touch the keys of the instrument—Bach, copying by the light of the moon the volume of music which belonged to his brother—Haydn performing menial services for old Porpora to obtain musical instruction from him in return—Mozart, the infant prodigy, performing and composing from his tenderest years—Schubert playing in the family quartett with his father and brothers—Liszt, while still a child, making for himself a European reputation as a virtuoso—such are a few of the portraits which would be brought before us. In some respects, however, the youth of Mendelssohn is the most remarkable of all; for in him we find a premature development of intellect which is altogether without parallel. While still a boy he wrote music which no man need be ashamed to own; and though as an absolute genius he cannot be compared with Mozart, yet none of the youthful compositions of the latter approach, much less equal, in power such works as the Octett or the *Midsummer*

Night's Dream overture, both of which were written while Mendelssohn was still a boy. A remarkable thing, too, in his case is that whereas for the most part "infant prodigies" either die or grow up into very second-rate adults, his power constantly developed; and while there can be little doubt that his ceaseless mental activity brought his life to a premature close, there was to the last no failing of his strength, and many of his latest works are among those which most unmistakably bear the impress of his genius.

The explanation of this is probably to be found in the exceptionally favoured circumstances in which his lot was cast. The son of a wealthy banker, and blessed by the care of a most excellent and sensible mother, he enjoyed educational advantages such as none other of the great musicians, unless it be perhaps Schumann, could boast of. His parents, too, while carefully fostering, were too discreet to force his budding talents. It will be interesting here to quote the opinion of his friend Sir Julius Benedict, as given in his *Sketch of the Life and Works of Mendelssohn*.

"Much of his subsequent greatness," Sir Julius writes, "is referable to the perfect moral and physical education he received at the hands of his parents, seconded by the most carefully chosen masters. Whilst making him pursue his classical studies, in which he was inferior to none, cultivating the wonderful genius and talent which he from earliest childhood displayed for music—constantly leading his mind in the right direction, anxiously watching over the development of his religious feelings—his parents checked every tendency to form too high an opinion of his own merits, or to depart from the childlike simplicity of his manners. Favoured thus by Providence with an independent and even brilliant social position, surrounded by men eminent for science and mental attainments, kept from the contact of all that was vulgar and mean, the tender plant was carefully fostered, and soon unfolded its blossoms."

The charming little book before us is, as it were, an incidental commentary on the above remarks. It shows us Mendelssohn as a boy, while still under the direct influence of his parents and of his excellent tutor, the worthy though somewhat brusque old Zelter. To the influence of this teacher, and the thoroughly severe and scientific training received from him, much of Mendelssohn's subsequent mastery of counterpoint (which is second only to that of Bach himself) is undoubtedly attributable. Zelter was an intimate friend of Goethe's, and in the year 1821, when young Felix was twelve years of age, his master took him to Weimar, to introduce him to the author of *Faust*.

An extract from a letter which his father wrote him is given in this book, and deserves quotation, as exemplifying the nature of the home influences of which we have already spoken.

"Keep your wits about you," writes his father. "Every time I write to you, my dear boy, I shall remind you to keep a strict watch over yourself; to sit properly and behave nicely, especially at dinner; to speak distinctly and suitably, and try as much as possible to express yourself to the point. I know what a good fellow you are, and therefore think it hardly necessary to remind you to be good and modest, and obedient to your

fatherly friend and guide, and not to forget often to think affectionately of us."

The boy's reports of his visit exhibit, as our author remarks, "a peculiar mixture of observation with the happy ingenuousness of a child." A full account is given, though not in the lad's own words, of a party at which Goethe amused himself with making a trial of Felix's talent before all the company. We read of Zelter giving him a theme on which to improvise.

"Zelter sat down to the piano, and with his stiff cramped fingers played a very simple tune in triplets, 'Ich trümele einst von Hännchen,' as tame and trivial an air as need be. Felix played it through after him, and next minute went off into the wildest allegro, transforming the simple melody into a passionate figure, which he took now in the bass, now in the upper part, weaving all manner of new and beautiful thoughts into it in the boldest style. Everybody was in astonishment as the small childish fingers worked away at the great chords, mastering the most difficult combinations, and evolving the most surprising contrapuntal passages out of a stream of harmonies, though certainly without paying much regard to the melody. It was one of Zelter's principles to be very chary of praise; his aim being to preserve his pupil from conceit and over-estimation of his own powers—'those cursed enemies' of all artistic progress'—as he called them. No sooner, therefore, had Felix finished, than he said in a tone of the most complete indifference, like an old pedagogue bent on spoiling the boy's brilliant success, 'What hobgoblins and dragons have you been dreaming about, to drive you along in that helter-skelter fashion?'"

Space will not allow a fuller extract, telling how Goethe tested the young musician by setting before him manuscripts of Mozart and Beethoven's to play at sight. The latter must have been no easy task, judging from Zelter's description—"Why, it's Beethoven's writing; one can see that a mile off. He always writes as if he used a broomstick, and then wiped his sleeve over the wet ink."

The interest which Goethe took in the lad is the more remarkable as he was not in a general way particularly fond of music. A droll story is given in illustration of this point.

"Once at Court, when a pianoforte player was in the middle of a very long sonata, he got up, and, to the horror of all the throng of Court ladies and gentlemen, said, 'If it lasts three minutes longer, I confess everything.'"

Of Mendelssohn's second visit to Weimar in the following year, when he was accompanied by his sister Fanny and his parents, but few details are given. We then accompany him to Paris, where he went in the spring of 1825 to consult Cherubini as to making music his vocation. No one was a greater adept at unpleasant and biting criticism than the caustic old *maestro*. Perhaps the neatest example of his wit is his reply (which may be familiar to some of our readers) to a young composer who had submitted a piece for his inspection: "Your work contains much that is new and beautiful; but, unfortunately, that which is new is not beautiful, and that which is beautiful is not new." From such a cynic, who was seldom known to say a civil word to any one, the opinion expressed after hearing Mendelssohn's piano quartet in B minor was indeed a surprise to

the Parisians: "Ce garçon," he said, "est riche; il fera bien; il fait même déjà bien, mais il dépense trop de son argent, il met trop d'étoffe dans son habit."

The long and most interesting extracts from the letters Mendelssohn wrote from Paris show a development of intellect and a ripeness of judgment which in a youth of sixteen are only less remarkable than his extraordinary musical attainments. These, however, we must pass over, and come to the last visit to Goethe, which took place in 1830. The account of this is in some respects the most interesting of all. We see more of the great poet; in a long extract from Mendelssohn's unpublished diary a conversation, or one should rather say discourse, by Goethe, on art, especially on Schiller's poetry, is given *in extenso*. Mendelssohn himself said, "It was one of those conversations which one can never forget all one's life." We see Goethe, too, having "music lessons"—the lessons consisting in Felix's playing to him for an hour pieces by all the great composers in chronological order, and then explaining what each had done to further the art. All the while he would sit in a dark corner, "like a Jupiter Tonans, with his old eyes flashing fire." We hear him expressing his admiration of Felix's playing by his favourite word, "Ganz stupend!" All this is told with such vividness, that the scene comes before the reader with the clearness of a photograph. The chief difficulty of doing justice to it in such a notice as the present is that all is so good that one hardly knows what to quote and what to omit.

Passing over the rest of the body of the book with the remark that it contains some highly interesting letters from both Mendelssohn and Goethe, we must come to the appendix, which, like a lady's postscript, is by no means the least important portion of the volume. It contains thirty-seven letters from Mendelssohn to different friends, which had not been previously published in any permanent shape. Fourteen of these were not comprised in the first edition of the book. Those who are familiar with the two published volumes of Mendelssohn's letters, or who are reading Hiller's "Recollections" the English translation of which has just appeared, will know what a geniality and charm there is about all his correspondence. The present letters are in no way connected with the body of the work; they are indeed all of a later date than the period of which it treats; but from their intrinsic value they are well worthy of preservation; and though throwing little new light on the character of their writer, contain incidental features which will doubtless be of service when a complete biography of the great musician shall come to be written.

From a purely musical point of view, perhaps the most interesting are the seven letters, Nos. 25 to 31, referring to the edition of *Israel in Egypt* which Mendelssohn provided with an organ part for the Handel Society. The scrupulous care with which he adhered in the minutest points to Handel's original manuscript, the reverence which he showed for his author's intentions, and at the same time the entire absence of dogmatism where only himself was concerned,

show the genuine artist. In one of his letters to Mr. G. A. Macfarren he says: "I expressed my opinion in my last letter, viz. to give way to everything which regards the English language or my personal authority, and in none which regards Handel's authority."

It is much to be wished that some of our modern editors and arrangers of Handel had been actuated by the same spirit. What would Mendelssohn have said had he been told that a modern eminent conductor would have had the presumption to vulgarise the close of one of the finest choruses of this very oratorio by the addition of three chords of his own!

Two letters (Nos. 19 and 20) written to Mr. (now Sir) Sterndale Bennett refer to a project of Mendelssohn's of publishing some of Handel's oratorios in the original shape, but with an organ part written out in full, as in the edition of *Israel* just referred to. It is a matter of regret that the scheme was never carried out. A manuscript organ part to *Solomon* is, however, in existence, and has been used in performances on the Continent, though never, we believe, in this country. One of the works which Mendelssohn contemplated editing was *Samson*, and in the letters we are referring to he asks a large number of questions as to details connected with the score, about which he felt in doubt. Had he lived to see the fine copy edited by Dr. Chrysander for the German Handel Society, he would there have found nearly all his questions answered.

One of the most interesting letters, which, unfortunately, is far too long to quote, is No. 17, written to his mother, in which he gives an account of a visit to the Queen and Prince Albert at Buckingham Palace during his stay in this country in 1842. This letter has been reprinted elsewhere, and it is probable that some of our readers will remember it.

The letter No. 23, addressed to Mr. Macfarren, furnishes another proof of the writer's conscientiousness in everything pertaining to his art. It is a regret that he is unable to play one of Mr. Macfarren's sonatas at his concert, because:—

"I would hardly have an hour till to-morrow night to play your sonata over. This I cannot think sufficient, and I would not be able to do it justice in my own eyes. Do not misunderstand me, and take this for false modesty; I know very well that I should be able to-morrow to play it through without stopping, and perhaps without wrong notes; but I attach too much importance to any public performance to believe that sufficient, and unless I am myself thoroughly acquainted with a composition of such importance and compass, I would never venture to play it in public."

The following letter (to the same) gives some details relating to the proper performance of the music to *Antigone*, which was brought out early in 1845 at Covent Garden Theatre under the direction of Mr. Macfarren. The letter shows Mendelssohn's practical acquaintance with the stage, and contains hints which would doubtless be found useful should the work at any future time be revived.

After the account we have given of the

contents of this volume, it appears wholly superfluous formally to recommend it. If the taste we have given of it does not induce readers to procure it for themselves, nothing we could add now would be likely to have that effect.

The general accuracy of the work is so great that it is worth while to call attention to one error, in order that it may be corrected in the third edition, which there is little danger in predicting will ere long be required. In a foot-note to p. 16, Mendelssohn's first quartet is spoken of as that "in B minor, Op. 3, afterwards dedicated to Goethe." This is incorrect. The first quartet is that in C minor, Op. 1, and the quartet in B minor (as moreover appears from the present work, p. 39) was not composed till about three years later. There is also a trifling slip on p. 170, which has probably arisen from the alteration in the order of the letters in this second edition. In the ninth line "Letter No. 11" should be "Letter No. 27."

We cannot better conclude this notice than by quoting Mendelssohn's humorous verses on musical criticism, written for his mother on her birthday in 1826, and given at the end of this volume:—

"Schreibt der Komponiste ernst,
Schläfert er uns ein;
Schreibt der Komponiste froh,
Ist er zu gemein.

"Schreibt der Komponiste lang,
Ist es zum Erbarmen;
Schreibt der Komponiste kurz,
Kann man nicht erwarmen.

"Schreibt ein Komponiste klar,
Ist's ein armer Tropf;
Schreibt ein Komponiste tief,
Rappelt's ihn am Kopf.

"Schreib' er also wie er will
Keinem steht es an,
Darum schreib' ein Komponist
Wie er will und kann."

EBENEZER PROUT.

THE series of Summer Concerts at the Crystal Palace came to a close last Saturday with a "Ballad Concert," at which the special feature was the magnificent singing of Mr. Sims Reeves, who seems to have completely recovered the use of his voice. A ballad concert, of course, calls for no detailed notice in these columns; nor is it needful to do more than say that the other vocalists were Miss Edith Wynne, Miss Helen D'Alton, and Signor Foli; the solo instrumentalist being Mr. Alfred Wells, the excellent flautist of the Crystal Palace Band; and the Crystal Palace choir also taking part in the performance. The series of concerts now concluded has, in a musical point of view, been far more interesting than the usual "operatic" summer concerts to which in previous years we have been accustomed, and to which people went to hear the singers rather than the music. We trust that the precedent established this season may be followed in future years.

THE usual series of promenade concerts at Covent Garden will commence next Saturday, under the direction of M. Hervé, the well-known French composer. M. Hervé will be assisted by Mr. Gilbert H. Bejtemann, who has been for many years connected with Covent Garden Theatre, and who will, we believe, undertake the direction of the more classical parts of the programme.

MISS EDITH WYNNE has been presented by

the Welsh Choral Union with a bust of herself and a diamond bracelet. The presentation took place yesterday week at the Hanover Square Rooms.

THE prize cantata specially composed for the opening of the Zürich musical festival by Herr G. Kauchenecker, as mentioned some weeks since in the ACADEMY, is spoken of in the *Musikalisches Wochenblatt*, by Dr. Hermann Kretschmar, the well-known musical critic, as "an excellent and effective *pièce d'occasion*." He adds, however, that the poem is so bad that everyone deserved a prize who attempted to set it to music at all.

THE preparations for the Bayreuth "Nibelungen" performances in 1876 seem to be advancing. The last number of the *Neue Zeitschrift für Musik* gives a list of the singers who have already engaged to meet Wagner for the study of their parts at Bayreuth this summer, with the rôles allotted to them, which will interest those of our readers who know the music. It is as follows—Herr Scaria from Vienna (Hagen), Niemann (Siegfried—this is most probably a misprint for Siegmund), Betz (Wotan), Hill (Alberich), Kruis, a buffo-tenor from Hanover (part not named, but probably, we think, Loge, the only part with anything of a buffo character in it), and Eilers from Coburg (Fasolt). As soon as the solo parts are ready the ensemble rehearsals are to commence.

LITERATURE.

Letters addressed from London to Sir Joseph Williamson, while Plenipotentiary at the Congress of Cologne, in the years 1673 and 1674. Edited by W. D. Christie, C.B., author of "The Life of the First Earl of Shaftesbury." In Two Volumes. (Printed for the Camden Society, 1874.)

JOSEPH WILLIAMSON was the son of a Cumberland clergyman. While yet a boy, he acted as secretary to the county member, who commended him to the tuition of Dr. Busby, of Westminster fame. Thence he was admitted, on the foundation, to Queen's College, Oxford, of which he became Fellow. Leaving Oxford to enter political life, he was secretary to Sir Edward Nicholas and to Lord Arlington, successive secretaries of state. In 1665, Arlington raised him to the post of Under-Secretary. The reasons of this preferment are thus stated by Evelyn:—

"[Lord Arlington] loving his ease more than business (though sufficiently able had he applied himself to it), remitted all to his man Williamson, and in a short time let him so into the secret of affairs, that (as his Lordship himself told me) there was a kind of necessity to advance him; and so by his subtlety, dexterity, and insinuation, he got now to be principal Secretary; absolutely Lord Arlington's creature, and ungrateful enough."

This entry in the Diary is under the date of July 22, 1674. Mr. Christie quotes only the words that follow it:—

"Sir Joseph was a musician, could play at *jeu de gobelets*, exceeding formal, a severe master to his servants, but so inward with my Lord O'Brien, that after a few months of that gentleman's death, he married his widow, who, being sister and heir of the Duke of Richmond, brought him a noble fortune. 'Twas thought they lived not so kindly after marriage as they did before. She was much censured for marrying so meanly, being herself allied to the royal family."

It is a pity that the copious illustrations of Williamson's character and career recorded in the abstract of State papers by Mrs. Greene have not been more freely used in the notes to this correspondence. Thence we learn that Williamson was an active agent in finding places and prebends for the dependents of his chief, Nicholas. By and by he had dependents of his own. One of these promises him (Sept. 30, 1667) 100 pieces for grant of the next prebend in Worcester, Gloucester, or Bristol, "or a living in any county, if considerable, will be no less welcome." But the "simoniacal oath" deters this conscientious applicant from anything more than an indefinite engagement. My Lord of Gloucester, he says, will give him a character that will speak him deserving of preferment.

As far as the Calendars enable us to follow his course, Williamson seems to have led the

rest of his life according to this beginning. Not merely kindly compliments of venison, cheese, and ale are sent him in requital of his services, but more substantial acknowledgments are offered. A delinquent reprieved from his treason-sentence knows that the order for his transportation may be had for sending for it, and sends for it accordingly "from his doleful prison in the Marshalsea," promising Williamson 10*l.* for his trouble. One Susannah Arnott, in need of his help, offers him 50*l.*, and a would-be auditor of Excise is prepared to pay him 100*l.* a year, a third of the profits of the place, for the appointment. Williamson was not a man to overlook occasions of gain. He had been made keeper of the State Paper Office by Nicholas in 1661. In 1664 he was second commissioner to take charge of the moiety reserved to the King of all prizes taken in virtue of a patent to the African Company. The income of all his subsequent offices, and the "noble fortune" of his wife, did not dull his keen appetite for money. The Treasury Papers of 1692 show him as an applicant for the rent of one of the manors forfeited to the Crown by the attainder of Lord Preston.

The "genial qualities" with which Mr. Christie kindly credits Williamson are not very conspicuous in his dealings with Sir Roger L'Estrange, as set forth in the Calendar above referred to. Sir Roger had started a Newsbook, and had asked the aid of Williamson, who had been setting up a newsletter of his own, sold for him by the agency, chiefly, of a clerk in the Post-Office, James Hicks (Hicks contributes one letter to the present collection). In his appeal to Williamson, L'Estrange had said of his own undertaking that the labour was great, and the profit small. Williamson instantly offered him 100*l.* a year to give up his Newsbook, but declined to assist him to continue it. From his conduct in the business, L'Estrange seems already to have "in a measure, survived his intellectuals"—as Collins phrases it. Williamson having supplanted L'Estrange, managed the Gazette in a niggardly fashion. His agent Hicks discontinued the annual dinner at Hornsey and the perquisites which the poor women who sold it had enjoyed under the former management. It required some pressure to shame him into giving something to one of them who had been wont to sell more than a third of the whole impression, and who had lost "all but her clothes" in the Great Fire.

The same grasping spirit prompted him in his attempt to bully his college into giving him permission to let the rooms therein assigned him—as he was constantly non-resident. But the authorities stood their ground. When he wrote that "if this favour were refused, he would take it undecently, by ways that he would be unwilling to recur to," Dr. Barlow, head of the college, replied that, "having sworn to the statutes, they are sure he cannot justly take anything from the college, nor do anything to its disquiet." He shall have all the privileges of a fellow, and "his chamber when he comes, but not the benefit or disposal of it in his absence."

The incident illustrates the meanness of Williamson, even in a relation where he was

exceptionally liberal. For he made presents to his college during his life (notably a silver trumpet to sound for dinner), and bequeathed to it 6,000*l.*, besides his collection of heraldic MSS., and of memoirs relating to his diplomatic mission.

A little more light as to the letter-writers would not have been unwelcome. For instance, one would like to have known more of the relations between his staid Excellency and Robert Yard, of whom Mr. Christie only lets us know that he was a "clerk in the Secretary of State's office, and became Under-Secretary in 1699." The Calendars show that Robert, when a boy, left England for Bruges, and thence went to the Hague with Lord Stafford. He wrote his first French letter to Williamson at the desire of the latter. His master writes to Williamson that Robert is improving in Dutch, as well as in Latin and French, that he is learning of a barber how to shave, that the money allowed for him is falling short, and that he, the master, wishes that "boys would employ their time well, and sooner be men." This was in 1667, only seven years before this correspondence.

The intelligence conveyed in these letters was derived either from official sources or from town talk. The former were not always available. The clerks in Arlington's office were, indeed, highly respectful to Williamson, and sent him communications duly ciphered, but their chief was distrustful of "his man" (as Evelyn calls him), and they knew that to baulk the transmission of news to Cologne was no displeasing service. Vernon, who personally stood well with Arlington, could not appear in his office on Williamson's business without offence. Sir Joseph's purveyors, Ball and Yard, hang about the office till twelve at night, and only know of the departure of an express by a message from the door-keeper, although they had enquired of Mr. Bridgman (a clerk, and one of Williamson's deferential correspondents) when it did set out. Poor Ball, writing thus at midnight, after his day's weary waiting, finished his letter with "Your Grace's obedient servant," and was sharply chidden for it. He had apologised beforehand for any errors from haste, and now abjectly acknowledges his fault, being ever

"My Lord,
"May it please Your Excellency's most obedient servant." (*sic*).

He had done the same thing before, but it either had escaped notice, or Williamson had been in a better temper.

The public voice was heard most loudly in the coffee-houses, though only faint echoes of the popular Babel reach the formal plenipotentiary: "I dare not write all I hear, and that from sober persons." "People make a hundred observations which I cannot think fit to commit to paper." These and like phrases continually recur. The nation was full of discontent. The bad courses of his Sacred Majesty, the "famous chair" of the Duchess of Portsmouth, and the gifts lavished on her and on the other mistresses, gave plenty of subject for scandal and censure. But the predominant feelings were hatred of France and dread of Rome. The schemes of Charles and Louis, though not

known, were divined by a sort of instinct. Every approach to a tolerance of Popery was watched with sleepless jealousy. In March 1673, Charles had been obliged to cancel the Declaration of Indulgence which, in February, he had declared he would "stick to." The Lords, on whom he relied, had counselled settlement by way of bill, and the victory of the Commons was secured by the Test Act. When these letters begin, the town is mainly occupied with the Dutch war and with the question who will qualify for office by taking the Sacrament before August 1, the date fixed by the Act. There are some complaints here recorded against the cowardice of the Dutch in fighting as best suited themselves, from a distance, as amusing as the singular exhortation to courage which was circulated among the officers of the English fleet. This stimulating document gave three reasons against running away. (1) It robs the King of the service he has paid for. (2) It is not safe. (3) It impeaches Providence, that delights to exercise itself in times of the utmost hazard.

Lord Clifford, whose orthodoxy was doubtful, gave out that he would set apart a certain day for preparation for the Sacrament. That very day, "coming out of Somerset House, in a private coach, the back way, with only Father Patrick with him, at the entrance of the Broad Place in the Strand the coach was unfortunately overthrown, and his Lordship and the Father exposed to the view of the street; one bringing his hat, another his periwig, with compliments that they were very sorry for the mischance."

Clifford resigned, as did the Duke of York, against whom the measure was chiefly aimed, but both were still watched narrowly. "There is great waiting to see his Lordship after this great change." "It is not to be writ the horrid discourses that passes now upon his Royal Highness surrendering; they call him Squire James, and say that he was always a Romanist; that he is retiring into the country, &c." "The people will have it that [the Duke of York] is very melancholy."

A camp had been formed at Blackheath for the mustering and exercise of the troops that were to pass over to aid the French in Holland. Much difficulty was found in raising troops for this unpopular service. Buckingham, who hoped to command them, tried the novel affectation of decent piety, and took the Sacrament at York to allay "the jealousies of the growth of Popery," an expedient he repeated the next year with even worse success when in peril of Parliament. The command was, after all, given to Schonberg. As a foreigner, he was disliked by the officers, whose bad example had relaxed the discipline he hoped to restore. Glimpses are given of the dangerous spirit of the men. At one time a drunken drummer is rescued from flogging by his comrades, on the ground that the officers get drunk and are not flogged. Again, when Lockhart's regiment is in open mutiny, an ensign, "being somewhat brisk" and drawing his sword, is immediately "knocked on the head and left dead on the place."

The hatred of France and the hatred of Popery met in the aversion everywhere manifested at the marriage of the Duke of

York with Mary of Modena. *A propos* of the match,

"the common people talk anything, for every carman and porter is now a statesman; and, indeed, the coffee-houses are good for nothing else. It was not thus when we drank nothing but sack and claret, or English beer and ale. These sober clubs produce nothing but scandalous and censorious discourses."

Parliament, having met on October 9, was prorogued for a week to give time for the marriage, which was, however, accidentally delayed. Twice again it met, and twice the Commons addressed the King against the consummation of the match. The new army was voted a grievance, and "evil counsellors" were being named, when a third prorogation put off the day of reckoning till January of the next year (1674).

Then the Commons "went round to work." While waiting the assembling of Parliament, the members in town "stormed at no rate," and declared that the business of the Dutch war should be fully examined in the next session. When the Houses met, Buckingham, accused of crimes public and private, tried to run before the breeze, and threw the blame on Arlington. He had his due reward in condemnation by the Commons and displeasure from the King. It was a bad time for the courtiers, and Coventry, "the cherub with the flaming sword," had a fatiguing duty as he kept turning every way. Addresses passed for the removal of Buckingham and Lauderdale. Arlington's business was referred to a committee, but further proceedings were stayed by a sudden prorogation.

"Common fame" had been busy with Williamson too. It was, perhaps, as well for him that his Cologne business, dragging a weary length, had to be hastened. The record of it may be seen still in the *Life of Sir Leoline Jenkins*, and he who reads will run, unless he be of sterner stuff than most. Sir William Temple and the Spanish ambassador swept away the diplomatic cobwebs and settled a peace in three days. The main current of events flowed as has been shown, but in the little eddies of this correspondence are some curious and interesting things. Not to speak of the tittle-tattle about the new duchess—a parallel to which may be found without looking far—there are glimpses of Rupert, hot to the last, the popular "hero" in the Dutch war; of Blood, with his mysterious "influence," his company endured with strange toleration by decent people; of the Duchess of Portsmouth, in an ill-spelt French letter in answer to Sir Joseph's congratulations on her dignity. The riot and bloodshed in Gray's Inn, begun by the gentlemen of the inn pumping upon some bailiffs; the case of Brown, hanged at St. Thomas Waterings for stealing a city heiress, and not reprieved according to custom when the King passed by, because the Common Council had petitioned against a pardon; the case of Pierce, tried for the same offence, but with this difference, that he was a citizen, and was allowed to get off with the country heiress owning him for her husband, his guilt thus "bringing its own punishment;" are some few samples of the matters to be found in these volumes.

His Cologne business ended, Sir Joseph returned to be, in due time, Secretary of State, President of the Royal Society, and manager of the "formal parts" of the negotiations of William III.'s reign. Those would seem to have been the parts best suited to him. The reflection of his character in these letters, written for the most part by his creatures, who strove to outbid each other in their great man's favour, is that of an industrious, subservient, solemn coxcomb, who was deeply interested in the fact that shops were duly shut on January 30, and would sedulously bestow "marks of his politeness" upon La Querouaille. He appears to have had in due proportion the happy combination of the Italian proverb quoted by Lord Bacon—"a little of the fool, and not too much of the honest." Mr. Christie pays a doubtful compliment to public servants when he styles Sir Joseph Williamson "a model official." R. C. BROWNE.

The Ballads and Songs of Scotland, in view of their Influence on the Character of the People.

By J. Clark Murray, LL.D., Professor of Mental and Moral Philosophy in McGill College, Montreal. (London: Macmillan & Co., 1874.)

THIS book with the tempting title is a prize essay reprinted for some occult reason. Probably there never was published anything with less result, anything that left the reader more entirely where he was. The tempting title, which we have already conceded to it, is its first merit and its last. It is only by the comparative method that such a subject could be treated with success; and yet Dr. Murray either knows nothing about any other ballad literature, or, if he does, adroitly conceals his learning from the reader. It is not by a few sporadic references to Tom Thumb or Thor's hammer, but by a systematic exhibition of identities and differences, that we should hope for any elucidation of this dark and attractive subject. And again, to write such a book even passably well, a man should have some notion of elementary aesthetics. It would require of him a way of thinking on such subjects a little more accurate, a use of language a little more definite, than Dr. Clark Murray's. For example, our author defines the object of the ballad as the "perfect imitation of nature." It certainly should not be possible for any one to emit such a definition who had ever thought for two consecutive minutes about the matter. Not even the name of Addison (from whom Dr. Clark Murray imitates his phrase, as from a great critical authority) can render tolerable so primitive a confusion of ideas. The ballad is a means of expression quite at the other end of the scale from any of the realistic arts; it is intensely abstract and subjective. This is to be learned in the infant school of art criticism. Whatever may be Dr. Murray's attainments in his own subject, it is obvious that his views of aesthetics are neither precise nor interesting. He is not the man to stand up and instruct his fellows. The root of the matter is not in him.

And accordingly, we turn over his leaves in a vain search for the solution, even for the treatment, of the most pressing ques-

tions. Making all allowance for his ignorance of other popular literatures, there is yet much that he could have illustrated and cleared up for us. One would have wished to know, for instance, whether the proud, self-reliant, democratic sentiment, so strong in Burns, is to be traced in any of the earlier songs of Scotland. One would have wished to hear something of the relations between the measure of the verses and the music to which they were sung. One would have hoped for some reference to a peculiar taking rhythm that recurs in all Scotch versifiers down to Scott or even Mr. Robert Buchanan. But of all this there is no word. Dr. Clark Murray goes on towards his own end, and passes these minor questions blandly and unconsciously by.

His own end, then, or rather that of the St. Andrews Society, of Glasgow, how is that accomplished? Well, this is the strangest part of the whole affair. We hear nothing whatever about the influence of this literature upon the people, save in passing and guarded allusions. Whether the Scotch are drunken because they have good drinking songs, or *vice versa*, the Doctor professes himself unable to decide. Whether certain indecorous verses, to which he alludes with a modesty highly becoming in a Professor of Moral Philosophy, may not have something to do with the number of illegitimate births in country districts, he is not altogether sure. In short, Dr. Clark Murray refuses, with singular discretion, to commit himself to any definite opinion on the subject; he is restrained, by a pleasing diffidence, from deciding for us whether their ballads and songs have had a great influence, or no influence at all, upon the people of his native land; he had rather, it appears, leave the matter open for the better judgment of the reader. Now, modesty is a good thing in itself; but the same modesty which withholds a man from resolving a question, should certainly keep him back from publishing the fact of his indecision to the world in more than two hundred pages of type. Indeed, the psychological problem thus presented is not without interest. Having set before himself a certain task, and having failed to accomplish it—having striven, honestly and strenuously no doubt, to set a certain question at rest, and having utterly failed to bring forth the least figment of an answer—having, in a word, miscarried of the whole purport of his book—we ask ourselves in wonder, what possible reason could have induced this unsuccessful enquirer to record, at such great length, the story of his failure?

ROBERT LOUIS STEVENSON.

Khiva and Turkestan. Translated by Captain Spalding, F.R.G.S. (London: Chapman & Hall, 1874.)

The Russians in Central Asia. By Frederick von Hellwald. Translated by Colonel Wirgman. (London: Henry S. King & Co., 1873.)

BOTH these translations are very useful additions to our knowledge of Central Asian affairs. The first on our list is written by a Russian, and reveals the spirit in which Russia's advance towards our Indian frontiers is viewed by the writer, who stands, it

would seem, in the light of an apologist before a section of his fellow-countrymen, and therefore the excuses and extenuation for her policy which he urges will be studied with interest by us. The other work will, we think, take rank as a compendium of reference on this question. It is by a neutral, and is itself erudite and impartial—such a work, in short, as might be expected from so painstaking, cautious, and conscientious a writer as Herr von Hellwald.

Captain Spalding, the translator of the Russian work, does not inform us who the author of *Khiva and Turkestan* is; but evidently the author or authors—for there appear to be traces of this book not being the work of one hand—are to a certain extent behind the scenes, and have access to authentic information.

The two books should be read and compared one with another, and here at the outset we are met by this difficulty—viz., the unsystematic way in which works referring to Central Asia are generally presented to the British public, in regard to the spelling of names and the use of foreign measures. Whether they are original works in the English language, or translations, such as the works before us, we insist that the orthography of the Eastern names should be correct, and that our weights and measures and the Fahrenheit scale should be invariably used. We notice in these volumes, for instance, that the name Perovski is used equally with Peroosky. The proper way of spelling the chief town of Central Asia in Russian possession, according to the system Colonel Wirgman professes to have adopted, is Tashkand, so also Samarkand—not Tashkend or Tashkent, or Samarcand. So also such frenchified orthography as Ak Mechet, Djazzuk, Tchemkent, should be avoided. Colonel Wirgman's transliteration of Eastern names is, however, much the most correct. Again, when reading of marches or heights of mountains, or degrees of heat, we prefer appreciating at once what is intended, without having to go through the computation of turning versts or German miles into English miles, or degrees Réaumur into degrees Fahrenheit, or Paris feet into English long measure. This defect the translators might with very little extra trouble have remedied, thereby considerably enhancing the pleasure with which these interesting volumes will be read. We must also add, that we could wish the names on the maps and those in the text agreed in the spelling better than they do.

Khiva and Turkestan is the first instalment of a series of essays or treatises on the various countries comprehended within the scope of the Central Asian Question; and we hope Captain Spalding will hereafter treat us to translations of the remaining portions of the Russian author's programme, viz., on the Khanates of Búkhára and Kokan, as also on Afghanistan and Báluclistan. As it is evident that neither of the authors of the volumes before us have visited the countries they describe, their works can only be regarded as compilations from various sources of information. *Khiva and Turkestan* is avowedly written for and addressed to Russian opinion regarding the advances past and future of that empire towards the south,

because it appears there is in Russia a strong national party who deprecate further annexation. With this object the habits and customs of the Turkomans and the vice and cruelty of the Khivan Court are minutely described, and it appears to us slightly overdrawn. The personal narratives of Vambéry and De Blocqueville form the groundwork for most of the descriptive portions.

Herr von Hellwald's industry is astonishing. The researches he has made on Central Asian matters have enabled him to present in his volume, *The Russians in Central Asia*, a mass of previously not generally known information concerning the campaigns against Khiva and Búkhára; but it is chiefly with regard to the advance of the Russian frontier towards China and Kokan and the nature of her relations with our new ally, the ruler of Káshgár, that we think the most important light has been afforded. His chapter on the military operations against Samarkand is highly instructive, and we are led to ask ourselves, if causes similar to those which led to that campaign should again present themselves, what guarantee is there that similar measures of policy may not be adopted by Russia? It is not, of course, our purpose here to do otherwise than to notice briefly the volumes before us, which we have done; but we cannot refrain from remarking how rapid Russian advance has been of late years. Commencing with 1839—the date of General Perovski's abortive but memorable expedition against Khiva, Herr von Hellwald shows how, nine years afterwards, by the erection of the forts of Karabutalski, Uralskoi, Orenburgskoi, and Aralski, the peace of the Kirghiz steppe was guarded, and the basis of operations in the valley of the Sir Daria secured. In another five years Russia by advancing another step planted her standards on the forts of Ak Musjid-Kasul, and Karmakchi, and the line of the Sir Daria fell into her hands. In 1859, six years afterwards, Chuláh Kurgan was taken; then followed in quick succession the seizure of Yani-Kurgan in 1861, Aulia Ata and Huzrut-i-Turkestan in 1864, as also that of Chemkand. Afterwards followed the fall of Tashkand, and, in 1868, a direct advance on Káshgár was contemplated, and a fort south of the Issutkul was built. Samarkand was taken in 1868, and Búkhára practically brought under Russian subjection. In 1869, further operations towards the south were interrupted by the revolt of the Kasaks, Kalmuks and Kirghis inhabiting the steppes from the Don to line of the Sir Daria. This revolt is said to have been stirred up by Khivan emissaries. In 1870 Kitat was taken, and then another point a long way off to the east, but still with the same object in view, was taken—viz., Kulja, in 1871. The fall of Khiva in 1873 completes the list as far as is now known. But who is bold enough to suppose Russia can stay where she is, or that the fanciful line of delimitation imagined for Afghanistan will secure respect for that kingdom? We have no pretensions to vaticination, but is it very speculative to assign 1875 for the capture of Merve? Or would it be very rash to say that in 1880 or 1885 the capture of Andekui Balkh and Kunduz will not enable Russia to complete her mili-

tary hold on the valley of the Sir Daria now incomplete? and then, as a corollary, the transference of the administration of affairs in Kokan Káshgár and Yarkand would be judged too imperative to respect the rights of the present rulers. It is possible at that date the Russian and British Indian frontier might be conterminous at some point between Yarkand and Leh. We doubt if such a state of things, at least on *that* side of India, would do us any harm; and no one can peruse the volume before us without being impressed that the abolition of the barbarism of native rule in Central Asia is greatly to be desired in the interests of civilization and progress, by whatever means that can be obtained.

BERESFORD LOVETT.

The Life of Christ. By F. W. Farrar, D.D., F.R.S. In Two Volumes. (London: Cassell, Petter & Galpin, 1874.)

It is at last a cheering sign for English theology that two such works as *Supernatural Religion* and Dr. Farrar's *Life of Christ* should have appeared within so short an interval of each other. We mention these books together simply on account of their excellence and genuine character, though in other respects they are very different. The first is all criticism; the second is only critical in quite a secondary degree. Dr. Farrar writes from the generally accepted stand-point, and avoids, for the most part, documentary as well as metaphysical discussions. He claims to be "allowed, after nineteen centuries of Christianity, to rest a fact of the Life of Jesus on the testimony of St. John without stopping to write a volume on the authenticity of the Fourth Gospel; or . . . narrate one of the Gospel miracles without deeming it necessary to answer all the arguments which have been urged against the possibility of the supernatural" (Pref. p. x.).

Elsewhere he writes, with reference to the historical question of the identity of the two narratives of the expulsion of the buyers and sellers from the Temple:—

"To give all the arguments which in each case have led me to a particular conclusion on disputed points, would require five times the space at my disposal, and would wholly alter the character of the book. I can only ask the reader to believe that I have always tried to weigh with impartiality the evidence on both sides."

As to the greater portion of this claim Dr. Farrar may certainly be taken at his word, for he evidently possesses a thoroughly competent acquaintance with the critical controversies; the conclusion that he has come to in favour of the orthodox theory is clearly not merely taken up at second hand but deliberately reasoned; and, if some should be found to question the strict "impartiality" of the judgment, none can doubt the perfectly honest and straightforward and unmistakeable manner in which Dr. Farrar's views are expressed. The difference between Dr. Farrar and his opponents of the sceptical school is in reality one of principle. Their canons of evidence and of reasoning are not the same. And if Dr. Farrar at times shows himself somewhat impatient of the kind of objections that are brought against the narrative of the Gospels, we are inclined to think that he has quite as much reason on his side as those who show an equal impa-

tience where their own canons of criticism are not implicitly accepted. It is highly desirable that there should be a greater amount of agreement on this preliminary ground; as it is, the two sides to the controversy are too often moving on different planes and never really meet.

The reader will, then, not expect to find in Dr. Farrar's work any new synthesis either of the history or of the theology of the Gospels, or any novel theories as to the origin and character of the Gospels themselves. His narrative is based directly upon that of the Gospels; and, though not debarred by any rigid theory of inspiration (ii. 181, n. 484), diverges from it only on slight and unimportant points.

Naturally, it was inevitable that this method should lead to results that have not always the appearance of being quite thoroughly grounded. The principal point on which we observe this is in regard to the sequence of the narrative—which, more perhaps than anything else, involves a fixed conception as to the relation of the Synoptic texts. For instance, in the early part of the narrative (the visit to Nazareth) Dr. Farrar prefers the order of Luke to that of Matthew and Mark; while in the later (the cleansing of the Temple) he prefers that of Matthew to that of Mark. Now it seems to us to be sufficient proof which of the three Synoptic Gospels is to be taken as giving the normal type of the narrative, when we observe that while in sixteen clear cases (twenty-four in all—adopting Holtzmann's sections) the order of Mark agrees with that of Matthew against Luke; and in fourteen clear cases (sixteen in all) the order of Mark agrees with that of Luke against Matthew, there are *no clear cases* of an agreement between Matthew and Luke as against Mark, except so far as the appearance of such agreement is caused by the insertion of fragments of discourse. The relation thus established in regard to the order of the narratives is remarkably borne out by an examination of the proportion of internal resemblances, which will be found to be nearly eight to one in favour of Mark—the resemblances between Mark and each of the other two Synoptics in turn, as against the resemblances between the other two Synoptics in points where both differ from Mark [the exact figures as computed by the writer of the present article are 1,684 Matthew and Mark, 944 Luke and Mark, total 2,628; against 334 Matthew and Luke; i.e., the whole number of resemblances, many of them of course being of the slightest possible, often syllabic, kind, and, also of course, only applying to the portion common to the three Synoptics]. These remarkable phenomena are, we think, sufficiently conclusive as to the normal value of the second Synoptic, though it is quite true that they seem to conflict with the dictum of Papias that St. Mark's Gospel (in its original form) was written *ὁὐ ράκει*.

If we are to notice here the very few points in which there seems to be anything of the nature of deficiency, or that might, perhaps, admit of correction in Dr. Farrar's book, we may as well say at once that several of these points would be supplied if he had had access (as does not seem to have been the case) to Wieseler's *Beiträge zur richtigen*

Würdigung der Evangelien (Gotha, 1869), a work supplementary to *Chronological Synopsis*, and one that might well be characterised, in words that Dr. Farrar himself applies to Zumpt, as one of "incredible industry and research."

A reference to this work would show that Zumpt's theory in regard to the census of Quirinus (which we observe is usually taken for the last word of criticism on the subject in England) is not quite so satisfactory as Dr. Farrar seems to think, though it will not therefore follow that Wieseler's own theory should be accepted ("this census took place as the first, [before] that instituted by Cyrenius"). It would also tend to modify the statement (i. 206 n.) that there is *no* evidence for the practice of reckoning the hours from midnight among the Romans, and especially, as Townson suggested, and as Wieseler seems to have proved, in Asia Minor (see *Beiträge*, pp. 253–5).

Turning to the larger questions raised by the book, we have just a doubt whether Dr. Farrar has quite sufficiently brought out the conflict between the Jewish and Christian Messianic ideals, or quite done justice to the effect that the first must have had in prejudicing the national party among the Jews against the teaching of Christ. Human motives are generally mixed, and there may have been elements not altogether reprehensible even in that seeming malignity which led to the Crucifixion. Something at least should be allowed for the intense disappointment of political and patriotic hopes; and the Scriptures themselves seem to treat the actual end of the struggle as inevitable.

To us it has always seemed that the contact and collision of the two Messianic ideas, the Jewish and Christian, affords the clue to most of that which is not of still more profound and universal significance in the life of Christ; and therefore we are inclined to think (somewhat in opposition to the usual opinion) that, e.g. in regard to the Temptation, there is a valuable element of truth in a view such as that maintained in *Ecce Homo*, which is hardly recognised in the more common theories which seem to be adopted by Dr. Farrar.

But leaving these points, which we do not wish to state as objections, but merely in the way of suggestion, the reader will wish to know what are the characteristic features and excellences of this new work of Dr. Farrar's. We perhaps might summarise them thus:—

1. A close and scrupulous attention to the text of the Greek original. So far as we are enabled to judge, all this part of the work is most carefully and well done, and the results accurately embodied in the narrative.

2. A like attention to all archaeological details. Dr. Farrar has made a special study of the authorities relating to the Talmud, and also, we gather, to some extent of the Talmud itself, and he has worked in the results of these studies in a very graphic and interesting manner.

3. The geographical questions he has settled in truly English fashion (it is strange that Englishmen should so seldom be deterred from thoroughness of inquiry by physical labour, and so often by intellectual), by taking the first opportunity to go over the

ground himself. He has thus not only been able to form an independent opinion (which is not exercised too dogmatically) as to the identification of the various sites, but he has also brought back with him—what was perhaps of more importance—the freshest sense of local colouring, which appears everywhere in the narrative.

4. We do not hesitate to say that the amount of illustrative matter thus accumulated is by far the richest that has hitherto been offered to the English public; for the Bishop of Gloucester's Hulsean Lectures, admirable as far as they go, are much more limited in scope. In most writers this would have led to heaviness or pedantry, but nothing could be farther from anything of the kind than Dr. Farrar's writing. The varied reading and culture of the author comes out on nearly every page; the number of quotations from modern poetry and literature is surprising; and it is quite characteristic when, as on ii. 162 n., he steps aside for a moment to suggest what we believe to be a new interpretation of a well-known passage in Dante, "*Colui che fece per viltate il gran rifiuto*," by referring it directly to the young ruler of Matt. xix. 22, instead of to Pope Celestine, as is usually done.

So far from being pedantic or heavy, the style is singularly rapid. "Eloquent" would be a word that might very fairly be applied to it. If there is a shade of redundancy, it is not in the scholarship notes, which are very compressed, or in the working in of learned minutiae, which is done with much skill, but rather, perhaps, in those portions which are not purely narrative or descriptive. It might be thought that the glitter and movement of the style was somewhat too sustained to be in perfect accord with the subject, which would seem in this respect to invite something more of brevity and repose, and, at times, perhaps of reserve. But an absolutely ideal combination of qualities is not of course to be expected in any one writer.

Dr. Farrar's book has filled extremely well what has hitherto been a void in English theological literature; it is admirably adapted to the public for which it is intended, and if we could conceive it in some respects altered for the better, it is highly probable that the consequence would have been only to make it less attractive to its readers. For a book which appeals to nearly the whole reading population, it would be difficult to have one more thoroughly scholarly and trustworthy.

Dr. Farrar is throughout most conscientious in acknowledging obligations; and therefore we are sure it is an oversight that, in vol. ii. p. 422 he has incorporated with the text a sentence ("a perfect balance . . . world-wide reformation") which is almost word for word identical with one of Dr. Keim's.* It is very likely an unconscious reminiscence, but the whole passage in Dr. Keim's work is so marked and represents so much solid and weighty thought, that we think it should be assigned to its author.

W. SANDAY.

Serbian Folk-Lore. Popular Tales selected and translated by Madam Csedomille Mijatovics. Edited, with an Introduction, by the Rev. W. Denton, M.A., Author of "*Servia and the Servians*." (London: W. Isbister & Co., 1874.)

THE Serbian stories collected by Vuk Stefanovich Karajich, and published by him at Vienna in 1853, have been rendered so familiar to all students of popular tales by his daughter's literal German translation, which appeared at Berlin in 1854, that there is no occasion to dwell upon the selections from his work which form the first third of the volume now before us. Of his fifty stories "*Madam Csedomille Mijatovics*" has translated about a dozen, the rest of her book being devoted to about as many specimens of "the '*Bosniacke narodne pripovijetke*,' collected by the '*Society of Young Bosnia*,' the first part of which collection was printed at Sissek, in Croatia, in 1870." These stories are not likely to be familiar to our readers, and therefore some account of them may prove of interest.

In the "*Bird Girl*," a Prince who cannot find a suitable wife is about to fling himself from the top of a high hill, when he hears a voice behind him crying: "Stop for the sake of the three hundred and sixty-five which are in the year!" Then there appears an old man, who tells him that on a neighbouring hill-top sits "an old woman with golden hair," holding a bird in her bosom. Whoever can seize her by her hair without her having seen him, and can take away that bird, will become the happiest man in the world. But the hill is covered with the stony forms of princes whom the old woman has petrified while they were striving to gain the bird. The Prince of course succeeds, forcing the hag to breathe "a blue wind towards the men of stone," who straightway revive, and to transform the bird by a kiss into a beautiful maiden, who gratefully presents him with her hand and an all-compelling staff.

The first part of the story of "*Sir Peppercorn*," is that of a wondrous child, "so extremely small that they christened him '*Peppercorn*,'" who plays the part of our Jack the Giant-Killer. A giant has carried off Peppercorn's sister, and killed his three elder brothers; but he rescues her and slays their murderer. The story is one frequently met with, but a curious incident in it is the agreement entered into by the giant with each of his visitors, that whoever of the two can devour a half-sheep first shall be at liberty to kill the other. The elder brothers succumb under this trial, but the youngest succeeds. "At last Peppercorn, by trickery, managed to get rid of his share of the sheep, and, according to the arrangement, killed the giant." The "trickery" is not explained. It may have been similar to that which, under similar circumstances, Jack employed towards the Welsh giant.

The second part of the Peppercorn story is that in which a demoniacal being successfully overcomes all but one of a party of companions, but by that one is itself vanquished, and pursued into its subterranean abode; the conqueror being left to perish there by his perfidious friends, but always

escaping, generally by means of a friendly bird. The European adaptations of the story are generally somewhat commonplace as compared with the striking form it assumes in the Calmuck version ("*Jülg's Kalmükische Märchen*, No. 3), and the Bosnian variant offers no very remarkable features.

"*Bash-Chalek*" is a curious version of the story of a prince whose three sisters are married to as many supernatural personages—in this instance the Kings of the Dragons, the Falcons, and the Eagles—and is by them saved from a demon who has carried off his wife. The demon is almost always found by the hero in a Bluebeard's or forbidden chamber, and is freed by him. In the present story the prince finds within such a room a man fast bound in iron, and unable to reach the water which flows before his eyes. Touched by pity, he not only gives the captive three draughts of the water, but he also pours some of it over his head, whereupon all the chains snap, and the freed demon flies away with his liberator's wife. The story always ends with the discomfiture of the demon, whose life depends upon some external object, frequently called his heart, which is enclosed in a series of protecting envelopes. In Bash Chalek's case, his "strength" is in a bird, which is inside the heart of a fox, which is within a very high mountain—an inferior series to those which figure in many of the numerous variants of the story, of which "*Punchkin*" and "*The Giant who had no Heart in his Body*" are the best-known representatives.

In most of its features "*The Shepherd and the King's Daughter*" resembles other stories about an impostor who for some time enjoys the reward due to a true man; but one of its incidents is peculiar. The hero, acting under an old woman's advice, has bought a cow, killed it, and filled a pot with its suet. This suet has the faculty of turning black people white, so he carries it to "the black world, where all the people are black as chimney-pots," and realises a large fortune by whitewashing its inhabitants, and especially its king, who is the blackest of all.

"*One Good Turn deserves Another*" is the same story as Grimm's "*Eisenhans*." A supernatural being is imprisoned by a king, but freed by the king's son, who is consequently banished. The grateful being assists the prince in all his undertakings, eventually enabling him to win the hand of a fair princess. The "*Biter Bit*" is a curious variant of the favourite tale of how a youth who has fallen into the hands of a wizard or magician is rescued by his father; ending, as is the case in many versions of the story, with a series of transformations almost identical with that which the narrative of "*The Second Royal Mendicant*" in the *Arabian Nights* has made so familiar. But the opening is singular. A man blessed with a hundred sons goes out in search of wives for them. He long wanders fruitlessly, but at last he finds a priest who is cursed with a hundred daughters, and who therefore is obliged to plough his land without the aid of even so much as a boy. A century of matches is arranged between the two families. But on his way to the

* We regret not to be able to lay our hands on the last volume of Dr. Keim's larger work, near the end of which the passage occurs; in the abridged edition it would be found on p. 370.

wedding the father of many sons leaves one of them at home; and as the hundred brides, and the ninety-nine bridegrooms, and the two hundred bride-leaders, and the two hundred witnesses, and the hundred runners, and the three hundred standard-bearers, and the rest of the party are going over a bridge, it contracts and holds them all tight. Then a Black Giant appears and demands, as a kind of toll, that which the father of the bridegrooms has forgotten at home, which is of course his overlooked son. The same story forms the theme of "The Trade that no one knows," but its opening scene is formed by a valuable variant of the Bluebeard story. The forbidden chambers are three in number, and are in a castle belonging to four giants. The hero finds in the first chamber "a golden ass, bound to a golden manger;" in the second, "a very beautiful girl, dressed all in gold and silver, who sat combing her hair, and setting in every tress a large diamond;" and in the third a collection "of human heads." These heads once belonged to young men like himself, who, having obeyed faithfully and strictly the orders of the giants, had been killed by them.

"The Three Suitors" relates how three nobles loved the same princess, each having an equal claim on her affections. They refer their dispute to the king, her father, who recommends them to settle it amicably, so they all leave their native country, and go into a far-off desert to live like hermits. "The Golden-haired Twins" is the well-known story of the calumniated queen, who is charged with having brought into the world puppies instead of princes. In this variant her children are buried alive, and from above their grave spring up two trees bearing "golden leaves and golden blossoms." These are cut down, and a bed is made of their wood. The bed is burnt, but two sparks fly out into the courtyard, and become lambs with "golden horns." They are killed, but their fleeces glide down a river, and turn into a box containing two golden-haired boys, who are eventually recognised as the calumniated queen's children. In "The Dream of the King's Son," the most interesting feature is the blinding of an old man by Vilas. His eyesight is restored by means of a herb which a captured Vila is forced to produce. The Vila being peculiar to Servia and its neighbourhood, all stories relating to that supernatural female are valuable. The present story seems to be the original of the Bohemian tale of "The Wicked Wood Fays" (see ACADEMY, June 6, 1874, p. 628). "The Three Brothers" is a strange and fatiguing medley of scraps of familiar tales, but there figure in it two supernatural females of interest. The first is a devouring girl who cuts her mother's throat and roasts her corpse, saying the while, "I shall do the same with my three brothers, one after the other, and then I shall remain alone the mistress of the entire property." She then, "having sharpened her teeth," eats up the body of her mother, "all except the head." The other singular female is an old woman who turns into ashes all that she touches with her little finger or the little toe of her left foot. The story of "Ani-

mals as Friends and Enemies" is a somewhat clumsy variant of one of the numerous tales in which a hero is assisted by animals whom he has treated well. The last story in the volume, "The Legend of St. George," is one of the most interesting, treating as it does of the heathen people of "the Trojan country," a fabulous district dear to South Slavonic romance. On the whole, these Bosnian stories are not very good specimens of popular tales, but they offer several points of interest to students. Mr. Denton has prefixed to the volume an introduction which ought to prove of service to the general reader, containing references to a great number of authorities on folk-lore, and giving, from the writer's own experience, some interesting information about Servian story-tellers or rhapsodists. We do not know if he or the translator is responsible for the references to "Grimm" which figure as foot-notes to the stories taken from Karajich's collection. Jacob Grimm wrote a preface to the German translation of the Servian tales, but that is not a sufficient reason for ascribing the book to him. No reference is given in the case of "Papalluga, or the Golden Slipper" (p. 58; the stories are not numbered), but the German version will be found at p. 187 of the Berlin edition. No references are vouchsafed by the translator in the case of the Bosnian stories.

W. R. S. BALSTON.

Darstellungen aus der Sittengeschichte Roms in der Zeit von August bis zum Ausgang der Antonine. Von Ludwig Friedländer. Dritter Theil. (Leipzig: Hirzel.)

THE third part of Friedländer's excellent book is to a considerable extent in the nature of a supplement to the earlier portion of the work, for it treats of the culture rather than of the moral state of the Roman Empire. In the course of this enquiry the author naturally came across the question as to the progress of luxury which is popularly supposed to have hastened the downfall of the ancient civilisation, and he therefore devotes a long introductory section to it. There undoubtedly was a time during the later republic when Lucullus and his compeers spent in extravagant living at Rome the wealth wrung from the provinces. They may be compared to the Nabobs of the eighteenth century who brought home untold wealth from India. And again, some of the early emperors, such as Nero and Caligula, spent the resources of the State in the wildest manner. But this is a very different thing from that universal system of luxury which alone would justify the popular view; and with Vespasian a much more simple style of living was restored. When we come to examine more closely the rhetorical statements of such writers as Seneca and Pliny on the subject, the view appears wholly untenable. What would be thought of a charge of luxury brought against the English nation on such grounds as these? "Look at the extravagance of your breakfast tables. You have at one meal coffee from the East Indies, tea from China, sugar from the West Indies, preserved meat from Australia: you make the uttermost parts of the earth contribute to your

luxurious life." Or again, "Your brave ancestors, the victors of Creçy and Poitiers, had none of your modern vegetables and fruit: all through the winter they lived on a little salt meat, and were content with common bread, while you must have wheaten bread, and potatoes, and other vegetables which Nature did not intend to bestow on your country, but which you have imported from distant lands and gradually acclimatised." The Roman moralist was far above such considerations as that scurvy and leprosy were rife in the Middle Ages, and that the more varied living and the introduction of new vegetables have largely improved the health of the nation, and increased the average duration of life. No, says Seneca, there is no excuse for you, "quorum profunda et insatiabilis gula hinc maria scrutatur, hinc terras;" "Why do men cross the seas which Nature had expressly placed to keep them asunder?" and so on. Gibbon had already ventured to put in a word in defence of the refinement of the age of Commodus (ch. ii.); and later writers have shown that to speak against the acclimatisation of plants and animals is to refuse the means of improvement to Italy, as well as to all other countries, since Italy in the earliest times must have been very unlike the Italy of our own days, with its olives and all the other products which we associate with Southern lands. It must, when the Roman state was forming, have been more like Northern Europe, covered with forests of oak and fir, and possessing a colder climate. Friedländer gives a sketch of the gradual introduction of plants and animals into the West, mostly condensed from Victor Hehn's *Kulturpflanzen und Haustihere in ihrem Uebergang aus Asien nach Griechenland und Italien so wie das übrige Europa*; but we need not enlarge on this subject: it will be sufficient to refer to Professor Rolleston's review of Hehn's valuable work in the ACADEMY (vol. iii. p. 309). In comparing ancient with modern forms of luxury Friedländer contrasts in many points the different tastes, or the superior advantages, of modern times: thus the ancients had nothing like the splendid gardens of our age, with their masses of clustered flowers and flowering shrubs.

The second section, on the Art of the Empire, brings out clearly how much greater a share the middle and lower classes had in the enjoyment of art than they have now, when art is a luxury of the richer class. It is astonishing to see how the walls of quite common houses were decorated with fresco paintings, how very fair copies of great works were to be had in cheap materials, and how extensively the lamps and other ordinary articles of household use were cast in artistic shapes. The ancients did not consider art as synonymous with expense. Pericles' praise of the Athenians, φιλοκαλοῦμεν μὲν εὐτελείαν, was applicable to a great degree throughout the Roman world, although the satirists justly laughed at the taste of the *nouveaux riches*, then as in all ages bad enough. The remains again of the great public buildings astonish us at this day, buildings in a large measure devoted to increasing the enjoyment of the lower classes.

Nor was it merely the Government which acted thus. In every little municipal town the richer citizens took pride in devoting part of their wealth to such public purposes. Notwithstanding some noble examples to the contrary, where individuals have founded public parks or free libraries, yet the upper and richer classes in England at this day do not compare favourably in this respect with those of Roman times. The much-abused Lucullus collected an extensive library, which was open to all. "The Greeks who were at Rome resorted thither, as it were to the retreat of the Muses." And this was only one of twenty-five public libraries at Rome. In England there are hardly any free public libraries; our colonial cities, such as Sydney and Melbourne, are far beyond us in this respect, and colonists on their return to England freely express their astonishment at such a state of things. The great collections of Greek and Roman Inscriptions contain hundreds of instances where the citizens of provincial towns have erected a thank-offering of some sort in gratitude for the way in which a rich fellow-citizen had constructed or repaired at a great expense a colonnade or baths or theatre. The public opinion of antiquity was strongly in favour of such a mode of employing wealth: that opinion has as yet only a slight influence in modern times, but is visibly becoming stronger. The existence, too, of a large artist class, which was in constant employment in these various ways, of itself tended to spread the taste for art. To our Northern climate may be due the idea of comfort; it remains to add to it the art of the South.

In the third section, on the poetry and prose of the age, a contrast is drawn between ancient and modern education. In our times the growth of science has necessarily modified the old system. Some knowledge of the laws of the universe in which we live, some acquaintance with the methods and results of science, is naturally required. This was of course nearly impossible in the Roman Empire, but the powers of language were cultivated to a much greater extent. The national literature—including, too, the nationalised literature of Greece—was far better known. The poetry and prose and music of that age could not but be largely imitative, but the best models were studied. As Tacitus shows in the dialogue *De Oratoribus*, the age of great oratory necessarily ended when Rome lost her freedom, and the same cause affected other large branches of literature, but education at least gave considerable breadth of culture. In Horace's days boys still had to work at the rude poetry of the early republic, but by Juvenal's time Horace himself and Virgil had become school books, as they have continued ever since. Even when Alcuin or other mediæval writers speak against this use of Virgil, they seem to half repent of their own severity. In this section Friedländer has inserted a number of discussions which are of value for the history of literature, e.g. on the chronology of Martial's Epigrams and of Statius' *Silvæ*, and on the friends and associates of those poets; and he points out a fact hitherto unobserved, that in compiling the famous *Gesta Romanorum* of the Middle Ages, to which later literature has

been so much indebted for plots and stories, some use was made of the *Controversiæ* of the elder Seneca.

Our author now passes to the religious state of the Roman world, first as under the influence of the pagan belief, then under that of Judaism and Christianity; of the gradual progress of which last in the Empire, a most interesting sketch is given. The long agony of Paganism and the prolonged struggle which it maintained against the new religion show its inherent strength. There had been a period of scepticism among the upper classes in and after Cicero's time; but in the second century A.D. there was a great religious revival, when the theology of the Stoics had partially reconciled reason and religion, and, as we see in the fragments of Aelian of Præneste, the pietism of the age was intolerant of unbelief and described in strong terms the miserable fate of unbelievers. The tone of earnest religion in Plutarch contrasts strongly with the scepticism of Tacitus or Pliny. It would be a mistake to think that the immoral acts attributed to various gods caused the pagan theology to have an immoral effect on the worshippers of those gods. Such acts were explained physically, or allegorically, or as exceptionally justified by the divine power, or looked on as mysteries; but the whole weight of the law of heaven was exerted in support of the moral laws which govern society, of which Sophocles says:—

"Their parentage is not of earth,
They nothing owe to human birth;
Nor is oblivion's sleep their lot,
Theirs is the might of God who ageth not."

And in this view Sophocles judged more truly than Plato, and his evidence is more valuable. The Roman Senate and Patriciate continued pagan to the last; in fact the sack of Rome by the Goths and Vandals materially helped the progress of Christianity, by destroying the classes most opposed to it. To a certain extent, too, the new faith adopted the feast-days and part of the ritual of the old religion, and so made the transition easier, as Middleton long ago pointed out. The lawyers probably held out a long time; it is wonderful how little trace of Christianity there is in the Institutes of Justinian, and some have even suspected that Tribonian was not a believer. It has been long noticed that in the death-song of ancient literature, the *Consolations* of Boethius, Christianity has no place. The heathenism of the cultivated classes fought a long fight, while the rude Germans were converted with little difficulty. And it was the glory of early Christianity that it raised the slaves and the women and the barbarians to the level of men, and did not despise the publicans and harlots and the miserable classes whom the Romans trod under foot; and would have none of the gladiatorial shows, and sternly prohibited infanticide and divorce and the loathsome abominations which are an indelible stain on the ancient culture.

And this introduces us to the section on "Philosophy as the Teacher of Morality," which is one of the most interesting portions of the whole book, but, like the rest of the work, is so condensed that our abstract cannot possibly give anything like a full idea of it: we can but select some salient points.

The moral philosophy of the ancients set before man a happiness, or highest good, to be attained in this life, not in one to come; a happiness which each might attain by his own efforts. His "freedom through knowledge" stands in the most striking contrast possible to the Christian "salvation through faith." To the wise man evil was either non-existent or indifferent; he was free, for he hoped for nothing and feared nothing. Epictetus resolved all practical morality into the maxim "bear and forbear," and this may be said to be the sum of all the leading schemes at this time. There was no preaching in the ancient religion—the philosophers were the preachers of morality; and Friedländer gives a complete account of their position in the State and in private families, their in many respects noble efforts, and their weaknesses sometimes of character and sometimes of position, which made their great effort at reform, as a whole, a failure.

The concluding section is therefore devoted to the consideration of the doctrine of Immortality, as held by both the educated and uneducated classes, in contrast with the Christian view. The future life was to the heathen only a continuation of the present, and always related to the present. Cicero could hardly explain the self-devotion of the Decii, and the self-sacrifice of the best men of all nations and all ages, except from their continuing to be conscious of the results of their great deeds. The worship of the dead was intended to keep up as close a connection between them and the living as possible. The dead were laid, not as with us in churchyards or cemeteries, but by the city gates, and along the roads on which their friends were always going to and fro. The fragrance of the roses and violets laid on their graves comes to the spirits in the under-world; they are still powerful to help their friends and avenge their friends' wrongs or their own. Thus we hear in early times that "Manes Virginiae, mortuae quam vivae felicioris, per tot domos ad petendas poenas vagati, nullo relicto sote tandem quieverunt" (Livy, iii. 58); and Hanno complains that Hamilcar's restless ghost still stirs up war against Rome (xxi. 10). The appearance of Caesar to Brutus before Philippi is quite in accordance with the ancient view. The dying words of Socrates sum up the ancient theory on both its sides: "Death is either an everlasting sleep, or the passage to a new life—in neither case is it an evil:" words in striking contrast with the Christian conception.

We trust that the author may yet be able to carry out the scheme, at which he half hints, of considering more fully the condition of the provinces under the Empire; a task which, as he says, is impossible until the completion of the *Corpus Inscriptionum Latinarum* shall supply the requisite materials. The whole subject is deeply interesting, and the questions debated far more important than those with which our histories of the Empire are so often filled, such as, Was Tiberius in fact so very bad a man? Was not Caligula on the whole mad? Did Nero actually fiddle while Rome was burning? and the like discussions, which are mainly valuable to those who account for historical changes by anecdotes, or wish to indulge in attacks on modern Caesarism.

But for those who really wish to know what the ancient civilisation was, and to see how thoroughly ancient history is distinguished from modern by its culture and its modes of thought, nothing could be more welcome or satisfactory than Friedländer's great work.

C. W. BOASE.

The Jade Chaplet. In twenty-four Beads. A Collection of Songs, Ballads, &c. (from the Chinese). By G. C. Stent, M.N.C.B.R.A.S. (London: Trübner & Co., 1874.)

MR. STENT has given us these specimens of Chinese songs, ballads, &c., in an English garb because, "so far as his knowledge goes, the songs of the people, redolent as they necessarily are of the deepest and most widespread tendencies of national thought, have hitherto been comparatively neglected," and because he has "felt that some real translations of Chinese popular song would not be without their value as illustrations of the mental status of an important section of the human family." We have read his volume with much pleasure, and only regret that in a few instances he has been betrayed into using some slang expressions of too pronounced a nature. It is quite refreshing to see the sounds of Chinese characters written in an intelligible manner, and we would add that the explanatory notes which accompany the songs display considerable research, and are a very good feature in the book, for without them most English readers would have been much puzzled by such figurative expressions as "three inch gold lilies" (*i.e.*, small feet), "yellow springs" (*i.e.*, the grave), "autumn billows" (*i.e.*, beautiful eyes), &c.

"Adventures of Tiny Rill," "Snow in Summer," "Chang Liang's Flute, or Home Sickness," and "Silken Meshes," are among the best pieces in the collection, while "Crossing the Ferry, or Pickaback Love," is an amusing love story. All things considered, the "Azalea" is probable the most interesting "bead" of the *Jade Chaplet*, and it was selected by Mr. Stent "as a fair specimen of an improvised song, and also as one showing the immense amount of historical information some of these improvisators will glibly run off in rhyme." The "Chain Puzzle" is merely given as an example "of the weak and diluted style of songs we in the West call 'sentimental.'" Those who are at all acquainted with the customs of the Chinese will be aware that at the Ching-ming chieh (or *term*) in the third moon (April) it is their practice to visit the tombs of their relations to *chi-sao*, *i.e.*, "offer sacrifices and sweep," on which occasion they also burn mock or paper money; this Mr. Stent in "Fanning the Grave" hits off very concisely in the lines:—

"Each loaded with a good supply
Of imitation sycee shoes,
To burn—for friends defunct to use—
Of dainty viands, oil and rice,
And wine to pour in sacrifice
On tombs of friends who'neath them slept.
(Twas '3rd of the 3rd' when the graves are swept)."

We do not quite agree with Mr. Stent in his manner of writing Chinese proper names;

in fact he is not consistent, for he writes Jên Kuei in one place and Jên-kuei in another, the former method being, in our opinion, the correct one. We cannot see any possible necessity for placing a hyphen, as he almost always does, between the surname and what corresponds to our Christian name, which in Chinese follows the former. Yang-kuei-fei had much better have been written Yang Kuei-fei, Yang being the lady's family name and Kuei-fei her *ming-tzū* or Christian name.

In conclusion, we heartily join Mr. Stent in the hope which he expresses that the student of popular poetry will find in this book matter worthy of his attention, and, for our own part, with the slight exceptions we have noted above, we think that this effort to place Chinese songs and ballads within the reach of English readers is worthy of much commendation.

EDW. DUFFIELD JONES.

ENGLISH DIALECT SOCIETY.

English Dialect Society. Series B. Reprinted Glossaries. Edited by the Rev. Walter W. Skeat, M.A. (London, 1873.)

THE English Dialect Society needs no introduction to the readers of the ACADEMY. Its progress has been so regularly noted, that we may at once proceed to the subject-matter of the first issue. The editor (whose name is a sufficient guarantee for sound and honest work), remarks that "study of English dialects has hitherto lain under several disadvantages, one of which is the difficulty of consulting the various works that have appeared on the subject. Many glossaries have been issued in the form of mere appendices to works upon very different subjects." A striking proof of the necessity for disinterring these old word-lists is the fact that the present volume contains the dialect matter from one quarto and eleven octavo volumes. These glossaries are well worthy of a careful examination, and will prove suggestive to those who are studying the question. They will help to establish the geography of provincial English. If those who run through them would mark the words which are current in their own county, much would be gained.

The word *tassel*, or *tazze*, for instance, which occurs in No. i. (Hutton's *North of England Glossary*, 1781), has escaped the vigilance of Wilbraham, and is not entered in his *Cheshire Glossary*, although it was certainly used in the county eighty or ninety years ago. Dr. Hutton, by the way, was not very careful; he gives "Manshut, *s. b.*, a load of bread," which is simply *manchet*, a term used in Manchester within memory. Its modest dimensions are somewhat exaggerated by the definition. *Shive* (p. 11) is a word still in daily use in Lancashire. It occurs in the fine old ballad of Lord Beichan—

"She asked one *sheave* of my lord's white bread."

Two MSS. of the *Promptorium Parvulorum*, as well as Pynson's edition, give *schyve* in place of "Schyvere, of brede or oper lyke"—the reading of the best text.

The second glossary represents East Yorkshire, and is taken from Marshall's work on the rural economy of that county, published

in 1788. It includes some interesting bits of folk-lore. "Bride-door" is described to be a favour given by the bride, and run (sometimes ridden) for by the young gallants of the district. "Bride-wain, a carriage loaded with household furniture and utensils, travelling from the bride's father's to the bridegroom's house." This was done in grand style, "ten or perhaps twenty pair of oxen have on great occasions assisted." A young woman working at a spinning-wheel surmounts the load, and by the continual accession of the gifts of friends as the procession moves along in slow and stately march, the wain in reality is "set fast" by the weight, or, at least, "affects a virtue if it have it not."

"Fond-plufe" is the name of some mummifying customs connected with Twelfth Day.

"Horsam, Hungil money," points to a bygone condition of agriculture. When Marshall wrote, a tax was still paid by part of the Vale of Pickering, which had been originally intended to reward "horsemen and hounds kept for the purpose of driving off the deer of the Forest of Pickering from the corn fields which bordered upon it." Pointing to the old plan of allowing the townlands to remain fallow every third year, when there would be no need for these guardians, "the *fauf* year is still (1788) exempt from this imposition."

"Riding the stang" is a phrase which will recall the description of the virago whom Hudibras sees borne along in scornful procession for having drubbed her husband.

The word *gait* is a noticeable one. It is one of the most indispensable idioms to the folk both of Lancashire and Yorkshire: "gossip-gait," "git a *gait*," "set a *gait*," &c., are phrases which would be greatly missed if forbidden.

The word "hubbleshe" = a hubbub, a tumultuous assembly, will remind those who have seen it of the most original of all dramas, Miss Carstairs' *Hubble-shue*. The use of the word by this Fifeshire lady shows how widely extended the word has become.

The East Norfolk (iii.), Vale of Gloucester (iv.), and Midland Station (v.) Glossaries, by the same author, are not so full as the preceding. In Gloucester we note the use of words *nast* = foulness and *nesh* = tender, still common in Lancashire. The last is, of course, the A.S. *hnesce*. No. vi., Marshall's West Devonshire Glossary, 1796, contains a tantalising definition: "Cousin Betty, *s. b.*, a female changeling, real or counterfeit, who goes about the country to excite charity, as she does in Yorkshire under the same name."

There is an example of popular humour in the name *Necessity* given to spirit illegally distilled by housewives of Devon from the dregs of the fermenting room.

The seventh and last Glossary in the volume is one of the West Riding of Yorkshire, contributed to the *Archæologia* in 1811. This contains several folk-lore notes. "Merry Nights" are joyous assemblies of the young people, and at the conclusion "each rustic nymph is finally conducted by her partner of the dance to her father's house, into which both enter without noise and, seated on the long settle, prolong conver-

sation in gentle whispers till the first streaks of dawn admonish the youth to retire." This custom, formerly common also in New England, will remind the reader of the method of rural courtship known as "bundling."

The social law which rigorously rules the intercourse both of high and low, is illustrated by the term "laithing-row" applied to "the district from which matrons are invited by special summons to be present at a child-birth or at the death of any of the inhabitants." To omit any one entitled was, we are told, "an affront not to be forgiven." The word is used in Lancashire also, but is there pronounced "lathin." Before a funeral a messenger is, (or was), sent round to the cottages to *laith* those whose presence is desired. "Spong-whew" is the word given to a method by which toads were tortured to death. A long wooden bar is rested upon a convenient place, and the toad is placed at its end whilst a youth with a stout stick strikes the other end of the bar with all his strength. The poor animal is jerked up high in the air, and falling down upon the earth is crushed to jelly. The toad is an object of superstitious dread. "Toad-bit" is a disease of cattle attributed to this animal "ugly and venomous," for which lustration by fire was employed as a remedy. *Glender, gloppened, gumption*, may be named as examples of the difficulty of drawing the line between dialects. They are as common in South Lancashire as in the West Riding of Yorkshire.

The three largest glossaries in this volume relate to Yorkshire, and furnish valuable data relating to the folk-speech of that important county. It is curious that in none of the three is there any record of the word *mistel*, which in the West Riding at least, generally replaces the word *shippin* or *shuppen* as the name of the cow-house. Dr. Willan mentions the Yorkshire charm, "In dockon—out nettle," and appears to have been the first to point out how it explained the passage in Chaucer's *Troilus and Cressida*, b. iv. ver. 461.

The value of these old word-lists to the philologist is already acknowledged, but some of the above quotations may serve to show that they also contain matter of interest for the student of folk-lore and the archaeologist. In particular, it may be said that a careful study of the field-names and other agricultural terms scattered through old glossaries would, in all probability, throw fresh light upon the early history of English systems of land tenure and culture.

WILLIAM E. A. AXON.

HENRIK IBSEN has returned to Norway after a voluntary exile in Rome and Dresden of more than ten years. He has been received with enthusiastic homage.

THE great German novelist, Paul Heyse, has completed the loving task of revising and carefully editing the collected work of his friend, the late Hermann Kurz, who was alike distinguished in Germany as a novelist, a poet, and a politician. Kurz was in every sense of the word a scholar, and in addition to his numerous and most admirable poems, tales, romances, and critiques, he gave his countrymen polished translations of Ariosto, Cervantes, Chateaubriand, Shakspeare, Byron, Moore, &c.

NEW NOVELS.

One Only. By E. C. P. Two vols. (London: Sampson Low & Co., 1874.)

Lonely Carlotta. By A. E. N. Bewicke. Three vols. (London: R. Bentley & Son, 1874.)

Emilia's Inheritance. By Emma Jane Worboise. (London: James Clarke & Co., 1874.)

The Love that Lived. By Mrs. Eiloart. Three vols. (London: Samuel Tinsley, 1874.)

READERS of *One Only* will probably have occasion to change their minds more than once during the course of the novel with respect to the meaning of its name. While reading the first volume they will be disposed to think that it refers to the number of novels which the author will think fit to write, and will wonder that she was at the pains of writing even this one: while reading the second they will look on it as an invitation to read either volume but not both, and will find that it is almost a matter of indifference with which volume or at which end of the volume they begin: and not till the end of the book will it dawn on them that the author has set bounds to her ambition, and does not expect to meet with more than one kindred and appreciative mind, the product of an age when the callow offspring of novelists are pitilessly dropped from the maternal nest before they have the least covering of feathers to protect them from the wind of criticism. The novel is one of those amiable and harmless novels which a large number of educated Englishwomen could write, and yet refrain from publishing. Simple but not pathetic, disjointed but not dramatic, brief but not witty, it might still have been effective if the author had kept it till she had studied life a little more closely, and learned the conditions of her trade a little more thoroughly. But she seems to hope that much may be forgiven her chiefly on the ground that she has read much. She is not of the school which loves names for names' sake; the laughter and tears of her characters do not recall to her, as they recall to one of the most popular of her sisterhood within the limits of a paragraph, the names of Rabelais, Scarron, Piron, and Heine; the mental and bodily sufferings of her hero do not remind her, as they remind another of the same community within the same bounds, of Damiens, La Barre, Ugolino and Agamemnon; and she can paint a man of spirit without allusions, such as are dear to a third, to Achilles, Bayard, and Don Quixote. But she takes delight in placing irrelevant quotations at the head of each chapter, and in setting Shakspeare cheek by jowl with the Baron von Feuchtersleben, Sir Walter Raleigh with Lord Lytton, Michael Drayton with the venerable Gammer Gurton; and goes to one poetess for the statement that "a fish gasped on the floor," and to another for the observation that "she did not think that December could follow so closely on June," and to a third to tell us that "her spinning all is done." And she forgets that when the reader has been introduced into distinguished company, he will be more critical with her story of Rose Camden, the

beauty of Aldersham, who angled for John Atherley the banker, and Charles Fenwick, the rich proprietor, and who, just as the fishes were "striving agood them to entangle," and Fenwick had nibbled at the bait, was herself carried off by an undergraduate of slender fortune. Charles Fenwick was the healthiest of a family of four invalids, and Rose's elopement, which killed the other three, shattered what little health still remained to him. Yet he lived on her memory, secluded himself from the world, and ultimately left his property of 18,000*l.* a year to her son, who is brought upon the scene in order that he may be present at a burglary which takes place at Fenwick's house, but which being loosely and hastily constructed, immediately falls to the ground. It is impossible to be interested in this eccentric person. When he was young and Rose was true it was pretty enough to hear that he "cooed and cooed and somewhat plaintively he wooed;" but as he continued all his life to coo and coo when the girl had imposed on the credulity of her somewhat plaintive wooer in an extraordinary manner, his disposition is found to be too much of the sucking-dove order to be within the range of human sympathy.

It is not surprising that the heroine of *Lonely Carlotta* should have found herself extremely lonely when she left her native Madeira to live in England. Brought up in a convent, she had developed a partiality for social intercourse and an aptitude for sudden intimacies which showed themselves as soon as "she was inducted into her first white muslin dress" and appeared at her first ball, when she allowed a young naval officer to call her a little darling, a little goose, and a little angel during the course of three dances, kissed him "with a warm hearty kiss such as she had in years long ago given to her big wax doll," and drew comparisons on the score of youth and beauty between her partner and St. Stanislaus which were not wholly favourable to the saint. Her sunny nature must therefore have been chilled when she was sent to her mother's relations at Clapham, and found that her two cousins were young ladies of unusual intelligence, who attended lectures on moral philosophy and garnished their language with interminable quotations from Hobbes, Ferrier and Hamilton. She could have little sympathy with the more practical cousin who taught Latin to young milliners, and when she despaired of making the rules of the "Ars Poetica" adapt themselves to bonnet-making, gave lectures in conic sections to young tailors, rightly believing that an acquaintance with the properties of parabolic and hyperbolic curves would be of assistance in cutting out trousers. And she felt even less warmth towards the speculative cousin who had won the affections of the philosophy lecturer by appreciating the novelty of his original ideas while her sister "referred to some half-forgotten man of note in the middle ages," and by professing admiration for his "fine and feathery curls." But a large number of persons tried to cheer Carlotta's loneliness. There was a brilliant journalist who wrote on Baptismal Regeneration in the "Tonans," and refuted his argu-

ments in the "Fulminans": who would "take his stand upon Empiricism," and then fly "to the heights of German speculation"; and who, in a word, was a very sorry rascal. He had a wife who married him for his articles in the "Tonans," ignorant of his connexion with the unorthodox "Fulminans": he had a mother-in-law who "gazed upon him as upon a vessel of wrath"; and while making love to Carlotta he was knocked down by one of her male cousins; so he retired to Spain to write fictitious correspondence for a daily newspaper, took to opium, and was ultimately shot by Communists in Paris. There was also Prince Vladimir, a Russian prince, torn in youth from the arms of his wife, who "wore her hair in silken plaits down to her knees," and banished to Siberia on suspicion of conspiracy. He now appears in London society, a tall gaunt man with cavernous eyes, now staring for long hours into space, now seeming to be a phantom to the visitors at the Horticultural Gardens, and generally flirting with Carlotta so desperately that the girl "twined her sweet imaginings about him." There was, moreover, the wife whom Prince Vladimir had left in Russia, who had become a celebrated beauty with a green gleam in her eyes and a skeleton laugh, who now wore her silken hair in modes which Parisian *coiffeurs* were afraid to try on other women, and who made Carlotta's acquaintance when the artless heroine was pilfering sugar from the *table d'hôte* at Vevay. And there were Polish counts and German barons and Spiritualists, and other strange beings who would have done more to cheer Carlotta if the greater part of them had not been killed at the end of the book. Their deeds and their characters are so remarkable that we are disposed to believe that the author, like Prince Vladimir, has been "accustomed to contemplate the grand spectacle of life from the topmost verge of the highest gallery," a position which, if one really wishes to see the grand spectacle, is considered the worst in the theatre.

The heroine of *Emilia's Inheritance* is a young person who in childhood had played castanets in short petticoats at country fairs, danced boleros and fandangos, performed on the tight rope, thrummed a guitar, played with loaded dice and marked cards, slept in pathless forests to the lullaby of wild beasts' roar, encountered herds of furious buffaloes, hungered in the wilderness, and had made herself as familiar with firearms as with pins and needles. An ironical destiny had now placed this wild creature in the luxurious country-house of Deepfields with her aunt Montmorency, who "wanted bones in her character," and with three beautiful cousins; and here she might have been happy if a half-starved individual had not been seen prowling about the house, apparently wanting bones as badly as the mistress of it. This man was her father, who had married one of the Montmorencys, killed three of his children by starvation, bullied his wife into insanity, and now lived in a ruin near Deepfields, supporting himself on stolen hares and selling the trinkets supplied by his devoted daughter Augusta. But there is a blacker villain than this Captain Crawford; a Spaniard, with face of

sickly yellow and bloodshot eyes and hair "far too abundant for grace," and bony fingers like claws, and the usual "nameless something" in his expression. And the reader has to master the details of a most complicated Spanish genealogical table, and understand the terms of a wonderful will made by an insane man, before he is in a position to appreciate a story which forms part of the *Christian World Library*. We are inclined to think that the author, a practised hand in this sort of work, forgot the didactic object of her book till she reached the middle of it, when all the characters suddenly begin to quote Scripture and the praying becomes fast and furious. But the incidents are not allowed to flag for this reason. A burglary takes place at Deepfields under the conduct of Augusta's father, and is only frustrated by the valour of the aged housekeeper who suddenly appears before the robbers in her nightgown and the footman's hat and coat, and the apparition naturally frightens them off. Then Augusta runs away to join her father and is followed by her admirer, Edward Dangerfield, who shows the quality of his admiration by expending lavish sums in a few hours in return for the most trivial information: buying at a grocer's shop a pound of tea, a ham, half a Dutch cheese, thumb-blue, mottled soap, two scrubbing brushes, and a bar of Spanish liquorice, merely to ask if the grocer ever supplied a customer named Crawford; then having his pocket picked to ingratiate himself with the inhabitants of Wapping, and finally making handsome contributions to a clergyman's sick fund to open a conversation about the church. Of course Augusta returns, and her father who appears at Etretat with his hair dyed red is converted by the curé, who is "a good man although a Catholic priest." The character of Augusta is well painted and the book is undoubtedly interesting; but it is chiefly remarkable as one of the first of sensational novels adapted to educational purposes, which, the educational portions being skilfully arranged so as to be detached with ease, appeal to two diametrically opposite classes of readers, the students of exciting fictions and the admirers of the *Christian World*.

All Mrs. Eiloart's books are honest books, spiced with independence of thought, and sweetened with a pleasant humour; and *The Love that Lived* possesses these qualities in as eminent a degree as its predecessors. The scene of it is laid in the old cathedral town of Wycheester, a borough torn asunder by political interests, the Conservative party being headed by the rich Mr. Rivington, of Wycheholme, and the Liberals organised by the Working Man's Club, the good genius of which is Tony Byng, compositor and philanthropist, and the bad genius Watty Griffiths, poacher and drunkard. Griffiths had conceived an invincible dislike to clergymen, mainly on the ground that one of them had united him to his wife, but incidentally because another had ventured to maintain the heretical doctrine that a man may not always "leather" his partner. So he formed a habit of calling on the vicar of his parish, and reading extracts from the People's Litany, praying that he might be delivered from kings and queens, lords and

ladies, bishops and priests, but unfortunately omitting factory clerks from the category, and so suffering himself to be knocked down by the hero, Robert Reed. But Griffiths was also a patriot, and in this capacity, when the election began, he was able to fix the price of the working man's vote; for when Mr. Rivington's son and an electioneering agent called to solicit his interest, his value was estimated at seven pounds, five pounds being paid as the price of a ferret, and two as a reward for removing it from the electioneering agent's leg. Yet, even this piece of public spirit was not appreciated by his enemy Tony Byng, the printer, a contemplative Hamlet in fustian, moralising on worms in churchyards, and striving to set the world to rights from his printer's stool. He preaches the equality of all mankind, and instils his views so effectually into the mind of young Robert Reed that the factory clerk aspires to the hand of Sibyl Cheyne, an heiress, living with the Rivingtons at Wycheholme. It ultimately appears that he was not presumptuous in doing so, being the eldest and legitimate son of Mr. Rivington, who had unintentionally committed bigamy, and whose love for his first wife was the "love that lived." We will not relate more of this pleasant novel, but will merely say that it breathes the fresh air of the country, that its characters are true to life, and that it well deserves the attention which it will no doubt receive. WALTER MACLEANE.

CURRENT LITERATURE.

Introduction to Irish Farming. By Thomas Baldwin, M.R.I.A., Superintendent of the Agricultural Department of National Education in Ireland. (London: Macmillan & Co., 1874.)

THIS excellent little treatise on farming is published in the handiest form. The practical utility of previous treatises by the same author has been shown by a sale of more than 60,000 copies. Though ostensibly an introduction only to Irish agriculture, the present work forms a useful study for agriculturalists in any country in Western Europe. And, although written with no such purpose, it shows that large profits may be made on farms of five acres, even in Ireland, the climate of which is much less favourable to spade husbandry than that of most parts of Europe. We ought to add that Continental experience is decisively opposed to Mr. Baldwin's view that, as wages rise, the still smaller farms which do not occupy the whole time of the labourer will be abandoned. The main cause of the increasing number of such little farms in France, Belgium, and Western Germany, is the rise of wages, which enables labourers to buy them, and tends also to make large farming less profitable.

Dwellings of Working People in London. Two Speeches delivered in the House of Commons, May 8, 1874. By U. J. Kay-Shuttleworth, M.P. and Sir Sydney Waterlow, Bart., M.P. (London: Ridgway.)

MR. KAY-SHUTTLEWORTH'S speech appears to us to be a very creditable one on a most important subject—creditable not merely for the ability which it displays, but also for the public spirit and energy shown in the investigations of which it was the result. It proves that there is a considerable supply of sites for dwellings of working people in London, yet that there is an unsatisfied demand, though it is what economists—to denote that the power as well as the will must be present—have called an effectual demand.

"The trustees of Mr. Peabody," we read, "have

still about 278,000*l.* left, available for the purposes of the Trust. There can be no doubt that the Trustees would lose no time in employing that money if they could only meet with the sites which they want, and yet I have shown to the House that such sites exist in great quantity."

Mr. Kay-Shuttleworth states his main proposal as follows:—

"I do not propose to rebuild London, or any part of London, out of the rates, nor should I think of offering any arguments in favour of such a scheme. All that I should propose would be that land should be bought by the Metropolitan Board of Works under powers similar to those conferred upon the Corporation of Glasgow. The land thus bought by the Metropolitan Board of Works would be again sold or leased by them at little or no loss. It might be desirable to give powers to the Metropolitan Board of Works to rebuild to a certain extent. The greater part of the building, however, would be effected by private enterprise."

Sir Sydney Waterlow adds:—

"What we ask is that this House, recognising the local authority which the Metropolitan Board of Works and the City of London exercise over the districts under their control, should impose upon these two public bodies the responsibility and the duty of submitting to Parliament, from time to time, schemes for public improvements involving the destruction of houses unfit for occupation, and the appropriation of the sites when cleared for the reconstruction of tenement houses suitable for the labouring population, upon plans to be approved by the local authority, in the manner provided by the Metropolitan Act of 1872."

We are far from denying the importance of these suggestions, but one of still greater importance is that, in the words of Mr. Mill in one of his great Westminster election speeches, "it is not an affair of building only." Mr. Mill seems to have had in view the causes which produce the enormous influx of a miserably poor population into London. As long as those causes continue to operate with their present force, measures such as Mr. Kay-Shuttleworth and Sir Sydney Waterlow propose can be but palliatives.

The Seven Ages of a Village Pauper. By G. J. Bartley. (London: Chapman & Hall.) The author has three practical proposals to make: first, that outdoor relief should only be granted to those who prove that they have saved; second, that parochial medical relief should be replaced by a provident system which might be self-supporting, and yet cost those who use it less than they pay now, and that facilities for saving should be multiplied. He illustrates with a good deal of ingenuity the way in which the present system actually discourages thrift at almost every point of life. But he is very far indeed from grasping the subject as a whole. In the first place, he makes no sufficient distinction between pauperism as the disposition to come on the parish rather than save, and pauperism as the disposition to come on the parish rather than work; in the second place, though he perceives that a large section of the rural population look upon relief as a right to be made the most of, he fails to draw the obvious inference that it would be a grave risk to try to diminish it. The fact is, that in the sixteenth and again in the eighteenth century, the conditions of life were changed by the governing classes in a way that was certainly not to the taste, and probably not for the interest, of the most numerous section of the agricultural community; at both periods the Poor Law was the instrument for keeping them quiet, and it was the indulgent side of the Poor Law which was most efficacious. It is true, of course, that the abolition of the Poor Law would, at the cost of immense temporary and much permanent suffering, have a tendency to raise wages, but it is not proved that measures more agreeable to the working classes will not be more effectual. In the third place, the writer fails to prove that it is worth an agricultural labourer's while to refuse indulgences when his

desires are strong, in order that his privations may be rather fewer when his desires are weak. It makes very little difference to the comfort of an old man or woman whether their pittance comes from the parish or from a government annuity; it is out of the question either way that they should have young people to wait upon them exclusively, which is the one real comfort of old age. It might perhaps be possible to promote thrift, and abolish outdoor relief in country parishes by doubling every man's savings out of the rates: would Mr. Bartley like that?

Pure Benevolence of Creation. By J. Travers. (London: Longmans & Co.) Mr. Travers is so painfully in earnest that he is not likely to get credit for the real ingenuity of his theodicy, especially as he has thought it necessary to fatigue the reader by constructing the logic of his subject as he went along, though his logic had nothing original in it. His theory is as follows: Permanent unmixed enjoyment is inconceivable, therefore it is unmeaning to demand it of Omnipotence; it cannot even be maintained that permanent possession of the conditions of the highest enjoyment would be worth having at all unless we were prepared by pain to profit by them. Further, all pain heightens the capacity for future pleasure, and all pleasure heightens the capacity for future pain. Hence if all sentient existence be endless, every life will have the same value in the long run, and will ultimately attain a condition in which less and less positive pain suffices to keep alive the capacity for more and more positive pleasure. The writer is aware of the abuse to which the doctrine of the indifference of the ultimate consequences of all actions is open, and replies not ineffectively, that as a right direction of the will is indispensable before a life can attain its maximum value, we had as well (or indeed better) be virtuous first as last. The writer does not seem to deal with the difficulty that sentient beings are organised, and that pain, if severe, tends to disorganisation, nor does he really bridge over the fundamental inconsistency of taking the principle that pain and pleasure must be correlative from his reason, and the other principle that God must somehow give pleasure the upper hand of pain from his wishes. The frank paradox of the ages of faith is much better.

"Avidi et semper pleni
Quod habent desiderant:
Nec satietas fastidit,
Neque fames cruciat;
Inhiantes semper edunt,
Et edentes inhiant."

We have received the *Presuppositions of Critical History*, by F. H. Bradley, Fellow of Merton College, Oxford (Parker & Co.), which is a very ingenious attempt to establish and guard the principle that nothing can be affirmed of the past except what can be inferred from the present. The treatise is perhaps rather conclusive than convincing in result, and in method too anxiously abstract and elaborate. The writer may be said to make out what he asserts, though not always on unquestionable grounds; but it is doubtful whether the thing asserted has the importance he attaches to it. If it were possible or desirable that any historical work should consist exclusively of "scientific history," or "critical history," then no doubt it would be indispensable to consider under what conditions a fact can be considered scientifically attested, and insist that "for history the fact means that which is real," and "the real means that which criticism has affirmed." But for practical purposes history is the record of what knowledge we can have of the past, and this knowledge varies very much. Moreover, much of the argument is vitiated by the writer's doctrine that our belief in testimony is always a matter of inference, as inference is treated as something that always is, or ought to be, conscious and rational; whereas the truth is that testimony, like observation, in the absence of cause to the contrary, impresses the mind quite

spontaneously and instantaneously. It is a mistake to describe the process by which we admit testimony to what we think probable in terms of the process by which we check testimony to what we think improbable. In the latter case the writer does not sufficiently recognise the option which we exercise upon strange things tolerably attested, whether the strangeness shall tell against the testimony or enlarge our conceptions of possibility. The latter process is for the most part gradual, and the point at which it issues in certainty varies for different minds; but it does not follow that a fact is to be excluded from history because a historian cannot present it as certain. Another grave omission is that the writer does not take into account, when insisting on the necessity of measuring the past by the present, the certainty that the action of permanent forces varies in intensity to an extent not yet measured.

Health and Education. By the Rev. Charles Kingsley. (London: W. Isbister & Co., 1874.) Canon Kingsley's last volume of reprints falls naturally into three sections. At the end we have Carlylese rhapsodies on Buchanan and Vesalius, and one Rondelet, a Huguenot doctor, who studied botany, and had a local reputation at Montpellier. The other two sections of the book are devoted to physical science, as it bears respectively upon health and education. The remarks on health are likely to be useful. The author insists upon indisputable truths about ventilation, preventable diseases, and the like, and recommends that young ladies should play ball, like Nausicaa. His suggestions would have been more useful if he had given more pains to analysing the obstacles which make it hard in a complicated society to act upon principles which it is easy to admit. For instance, all cottages would be healthier if built on high ground; but would labourers like always to have to go uphill at the end of the day's work? It would be easier to make practical use of the knowledge that the cattle plague was severest in the counties where the cattle had to drink more or less stagnant water. Essays like those on Science, and the Tree of Knowledge, and Bio-geology, and Superstition, are more questionable. They are nearly all ingenious and suggestive, and even instructive; but it probably hinders the progress of knowledge to put forward even better supported conjectures in a popular form, if they are to be invested, before they are proved or half-proved, with the double sanction of common sense and moral and religious fervour.—EDITOR.

NOTES AND NEWS.

WE understand that Mr. Lewis Morris, of Jesus College, Oxford, and Lincoln's Inn, is the "New Writer" whose *Songs of Two Worlds* have met with so favourable a reception.

SOME important additions by purchase have lately been made to the coin department of the British Museum. The Greek collection has been enriched by the acquisition, through Messrs. Rollin and Feuardent, of Mr. Addington's Greek Imperial coins, and a selection of Phrygian and other Asiatic coins of the same class from a collector in the Levant. M. Castellani has furnished some hitherto entirely unknown specimens of Italian aes grave, apparently of a weight superior to the libral, and rarities of the imperial series, including the pick of a recent find of silver pieces on the Esquiline. The class of imperial gold has been enriched by large additions from the Robert collection, procured by MM. Rollin and Feuardent. In the oriental series the very rare dinar of A.H. 77, the first struck with purely Muslim types, has been acquired from Mr. Rogers, late British consul at Cairo, besides some extremely curious Arabic gold pieces and Byzantine and Arab glass money from another collector.

MR. ALEXANDER J. ELLIS's lecture on Latin pronunciation and his translation of *Helmholtz*, are both at press.

MR. J. O. HALLIWELL has presented to the New Shakspere Society his collated copy of the printed text of "The Pageant of the Company of Shearmen and Taylors in Coventry," "nevely correcte be Roburt Croo, the xliijth dey of marche fyensschid in the yere of owre lorde god MCCCC & xxxiiijth," with the three songs and their music that "belonge to the Taylors & Shearemens Pagant."

DR. RICHARD MORRIS intends to bring out, in the course of a year or two, a short shilling English Grammar, to contain the accidence, analysis of sentences, a short syntax, and history of the language.

Two new books of travel are promised us from America: Captain Tyson's *Arctic Adventures*, including those of the *Polaris*, and *The Nimrod of the Sea*, or *The American Whalesman*, by Captain W. M. Davis.

DR. WOLFRED N. COTE, a Baptist missionary in Rome, is preparing a larger edition of his work on the archaeology of Baptism, entitled *Baptism and Baptisteries*. The work will contain fifty-three illustrations, including views of many of the most celebrated Baptisteries and Fonts, and representations of the rite from ancient frescoes and early illuminated manuscripts, with full comments in the text. Dr. Cote has brought together a considerable amount of information from the writings of the Fathers, and among other MSS. he has carefully consulted those in the British Museum, and is said to have obtained from Cardinal Antonelli the privilege of examining the collection of the Vatican Library. The work will be published by Messrs. Yates and Alexander, of Chancery Lane. Its interest and importance both to theologians and archaeologists are obvious.

MESSRS. PATERSON, of Edinburgh, and Sotheman & Co., of London, propose to issue in one volume royal folio, a handsome reprint of the "*Theatrum Scotiae*," containing the Prospects of their Majesties Castles and Palaces; together with those of the most considerable Towns and Colleges; the Ruins of many ancient Abbeys, Churches, Monasteries, and Convents, within the said Kingdom. All curiously engraven on Copper-plates. With a short description of each plate. By John Slezer, Captain of the Artillery Company, and Surveyour of their Majesties Stores and Magazines in the Kingdom of Scotland." The first edition of this interesting book was published in the year 1693, and contained fifty-seven plates; but, as the drawings for these were commenced about twenty years before that date, they really represent the condition and appearance of the principal towns and buildings in Scotland nearly 200 years ago. The letterpress of the first edition consisted of short descriptions of the places, and a series of dedications of the various plates to the leading nobles of Scotland, with their coats of arms finely engraved. In the three editions published during the last century, twelve additional plates were given, and in the year 1814 an edition with the plates very much worn was issued, with a *Life of Slezer* and large additions to the descriptions by Dr. Jamieson, author of the *Scottish Dictionary*. In the new edition now proposed to be published, the whole of the views will be reproduced by photolithography, from brilliant original impressions. The original descriptions will also be printed verbatim, together with the dedications to the nobility and their coats of arms in facsimile. The volume will be prefaced by Jamieson's *Life of Slezer*, with such corrections as may be necessary, while all his additions to the descriptions will be printed in the form of an appendix. The principal view of Edinburgh measures 32½ inches in length, and 12 inches in breadth, and all the other views, with one exception, are 16½ inches in length, and 9½ inches in breadth. The impression will be limited to 250 copies, at five guineas to subscribers.

WE are glad to hear that Mr. Trübner proposes

to publish an English translation of Jonas Lie's new novel, *The Pilot and his Wife*, of which we spoke a few weeks ago. It is certain to be welcomed by a large circle of English readers, to whom its fresh and unfamiliar pictures of seafaring life cannot fail to be attractive.

MESSRS. CHAPMAN AND HALL publish to-day *Gerald and his Friend the Doctor*, by the Rev. Henry Solly. Lord Lytton contributes an introductory notice.

WE have been so alarmed by the denunciation of "the Editors of the European press" in the new number of *Fors Clavigera*, and their habit of living by the sale of their "opinions, instead of knowledges," that we scarcely venture to hold, much less to express, the very harmless "opinion" that the following passage is one of painful interest:—

"The Pope's new tobacco manufactory under the Palatine, [is] an infinitely more important object now, in all views of Rome from the west, than either the Palatine or the Capitol; while the still more ancient documents of Egyptian religion—the obelisks of the Piazza del Popolo, and of the portico of St. Peter's—are entirely eclipsed by the obelisks of our English religion, lately elevated, in full view from the Pincian and the Montorio, with smoke coming out of the top of them. And farther, the entire eastern district of Rome, between the two Basilicas of the Lateran and St. Lorenzo, is now one mass of volcanic ruin; a desert of dust and ashes, the lust of wealth exploding there, out of a crater deeper than Etna's, and raging, as far as it can reach, in one frantic desolation of whatever is lovely, or holy, or memorable, in the central city of the world."

It is announced that Rabbi Joseph Kohn Zedek, of Léopol, has published in Hebrew a history of the Franco-German war of 1870-71. Another learned rabbi has recently published at Vienna a Hebrew translation of Shakspeare's *Othello*.

THAT we are still somewhat backward in our attempts to imitate the methods of Chinese culture in our seats of learning, may be inferred from an anecdote we have lately received from an eminent philologist. Shortly before leaving the Celestial Empire he came across an old native gentleman of the mature age of 106, who was just about to go in for his last examination. When will our University authorities succeed in attaining a perfection of the examination statute which can be compared with this?

THE second volume of the Cabinet edition of Tennyson's works contains the English Idylls and other poems, and is adorned—at least it may seem so to some readers—with a view of Aldworth by way of frontispiece. We wish that our copy could be induced to open elsewhere than at page 93, where a hideous misprint thrusts itself obtrusively upon our notice.

ON the list of courses of lectures and classes at Strassburg University for next session, we notice the following English ones:—Professor Dr. ten Brink on English Word-formation and Syntax, Middle-English Poets and Milton's Minor Poems; Lester White on Tennyson's Poems, Lewes's Selections from Modern British Authors, Exercises in English, and Elementary Lessons for Beginners. In the political section one of the series of lectures is "A Survey of the Present Social Movement in England, France and Germany," by Professor Dr. Schmoller.

THE statement that Professor Longfellow is writing a biography of Charles Sumner is, according to the *Boston Gazette*, without foundation. No new life, nor any satisfactory life, is likely to appear at present. Mr. Sumner left material for a very interesting volume, picturing his history before he engaged in the public service, which is in the hands of his literary executors; but no person to whom they would be willing to intrust it has as yet signified a desire to embody it in the biographical literature of the country.

It was announced in this paper, as elsewhere, that the well-known antiquary, Etatsraad Worsaae,

would accompany the King of Denmark on his visit to Iceland, and be present at the Thousand Years' Festival, which opens to-day. At the last moment, however, and to every body's surprise, the King appointed Worsaae Minister of the Departments of Religion and Education; the appointment was all the more startling because the antiquary has never before taken the smallest part in political affairs. His place on the Royal steamer was taken by the celebrated zoologist, Professor Japetus Steenstrup.

Two new plays by Björnsterne Björnson have arrived in Copenhagen. Both are comedies of the present time, and both are in prose. One is entitled *Redaktören* (The Editor) and the other *En Fallit* (A Bankruptcy). *Redaktören*, which we are privately informed is very original and able, is already in type, but neither will be published till the winter, as it is intended to bring them both out first on the boards of the new Royal Theatre, which will open in October. We understand that the Danish poet, Frederik Paludan-Müller, is preparing a drama for the same occasion, and that a new play may also be expected from Andreas Munch. The natural outlet for poetic thought in Scandinavia has always been the stage, and the opening of this new theatre ought to give a stimulus to dramatic literature.

A RUSSIAN journal states that a resident at the Finnish village of Toccovo has just organised some amateur theatricals for the peasantry. The dialogue will be in Finnish, and the play selected for representation is a fantastic piece entitled *Suomi*, the subject of which is taken from a well-known Finnish legend. We learn on the same authority that "Sir William Sydney, an English tourist now at St. Petersburg," has just commissioned a Russian sculptor to execute a series of busts of the most famous modern writers of Russia, beginning with Pouschkine.

THE committee appointed to conduct the proceedings connected with the new Croatian University about to be opened at Agram, has issued a circular, addressed to all European and American universities generally, begging them to send representatives from their own schools to do honour to the starting of this youngest member of the academic body on her way. The ceremony of inauguration is to take place in October, and the committee announce that the Croatian metropolis is preparing to do all possible honour to the occasion.

THE University of Tübingen, which was some years ago enriched by the accession of the choice and valuable library of Ludwig Uhland, presented to it by the poet's widow, has recently received from the same lady a considerable sum of money, constituting the entire proceeds of her admirable *Life of her husband* (*Das Leben Ludwigs Uhlands*, Stuttgart, 1874). This is in accordance with her wishes to be appropriated to the foundation of a scholarship for students devoted to the same studies as those pursued by her husband. Frau Uhland has also recently instituted a prize for scholars at the Gymnasium at Tübingen, where the poet received his preliminary training for his university career.

Blackwood begins a promising series of papers on the Himalya under the title of the "Abode of Snow." The writer complains of the policy of the Indian Government in allowing the Governments of Nepal and Bhotan to exclude explorers from the highest peaks. In the same journal, a general officer of the late Confederate army takes occasion of the ponderous escapade of the Count of Paris to remind us with a good deal of temperate dignity that the South had a case on which educated and conscientious gentlemen can still look back with comfort. "Seven Village Songs" are very dainty, rather airy than flowing.

It is simpler to buy the *Argosy* and read Mrs.

King's account of *Mdme. Cottin*, the author of the *Exiles of Siberia*, than to look her up in a French or German dictionary of biography.

In *Temple Bar* we have the most courteous and sober statement yet put forth, of what serious Conservatives are for the present disposed to make their ultimatum on the "Burning Question" of women's rights. Women may learn anything which does not make them less fit or disposed to marry; the writer is prepared for less illusory concessions as to strictly legal grievances in order that women may have no excuse for wanting votes. "Writers and Reviews" in the same is a very spirited account of the rationale of the plausible system which makes most contemporary reviewing so unjust to authors and so uninformative to readers. The author of an able paper on "Ben Jonson" imagines that his lyrics are the best of his work because they give him most pleasure now. A critic in dealing with a classic ought to be able to sink subjective preferences.

Macmillan has an interesting paper by G. F. Rodwell on the "Perception of the Invisible," which tells us what we should see with adequate eyes in a melting ingot of silver and the like.

A PAMPHLET, by Mr. W. Baptiste Scoones, addressed to the members of the Indian Council, and reprinted in *Macmillan's Magazine* for the present month, contains many valuable facts and suggestions. It is generally supposed that marks are awarded to each subject in proportion to its value as a test of ability. But this principle is violated when the same proficiency in any subject does not obtain the same mark. The same proficiency in mathematics, for example, may obtain this year three hundred marks less than last year, owing to the change of examiners, and the practice of deducting 125 marks. Thus, candidates grounding their hopes on previous examinations are cruelly disappointed. Honest work may be less serviceable than knowing "what subjects will pay this year." Ill-luck can be guarded against only by taking up a great number of subjects. Luck also predominates in the *vidæ vocæ* examination. In ten minutes it is impossible to discriminate the smatterer and the scholar. At the last competition, for instance, the subject of Comparative Anatomy was not even mentioned in *vidæ vocæ*. These defects are met by the following suggestions. There should be a permanent court of examiners to see that the "marks are distributed in accordance with a prescribed plan." The expenses of such an arrangement might be defrayed from the fees which candidates have now to pay. The *vidæ vocæ* examination should last at least half an hour, and should be conducted by two sets of examiners. There would thus be sufficient safeguard against smattering, without the method of deducting 125 marks—a method which (as Mr. Scoones proves) places the linguists at a very unfair disadvantage. There are some excellent remarks upon the age of candidates, the "final" examinations, and the study of natural science, in reference to which the statements of the Edinburgh Reviewer are refuted by an array of statistics. We have only space to notice the proposed method of selecting candidates. It consists of (1) competitive examination, (2) further selection in a college designed for this purpose. Candidates rejected by the authorities of this college as not suited for the India Civil Service might in many cases obtain other situations under Government. Thus the intellectual advantages of competition and the social advantages of Haileybury might be combined.

In the *Contemporary* W. Greg concludes the "Warnings of Cassandra" by an exhortation to the established clergy to concentrate their strength on inculcating that doctrine of the traditional, which is supported by least evidence and has hitherto excited least opposition. St. George Mivart, in Part iv. of "Contemporary Evolution," points out that the progress of science does not issue in demonstrating contradictions of Catholic

dogma, but only induces ways of thinking and feeling more or less incompatible with it; but we hardly know what he gains by this, as Father Newman has shown that faith does not rest upon demonstration but on appropriate ways of thinking and feeling. Sir A. J. Arbutnot's article on "Lord Ellenborough's Indian Administration" suggests, without stating, a question that has not been sufficiently discussed—Was Ellenborough as alone as he supposed in his determination finally to evacuate Afghanistan? Dr. A. Schwartz gives some amusing specimens of seventeenth century sermons in his "History of the German Pulpit." One preacher delivered a course of fifty-two sermons on "Mary as the Spiritual Paper Mill." R. A. Proctor, in his first paper on "Sir W. Herschel's Two Methods of Star-Gazing," maintains that Herschel fundamentally changed his methods and views without stating that he did so, and has consequently been misunderstood by all subsequent authors who have treated the subject, except Struve. A. S. Murray's article on "Greek Painters," suggests that as we have more gossip about them than about Greek sculptors, they had more contemporary popularity.

MISS BACON'S practical joke, which Lord Palmerston, oddly enough, took seriously, was followed up some years ago by Professor Holmes of Harvard, in his *Authorship of Shakspeare*, and has given rise to an article in this month's *Fraser*, "Who wrote Shakspeare?" It is the custom of our monthlies now and then to give accounts of the literary eccentricities or conundrums flying about: and the present *Fraser* article gives a sketch of the ingenious absurdities made to look like probabilities in favour of the perhaps foolish idea that ever entered man's head, that Bacon wrote Shakspeare's works. The only parallel to it in modern times would be, that the late Lord Lyndhurst, say wrote the poems of Burns and Keats, with great part of Coleridge and Byron. Fortunately Professor Holmes has mixed some sensible work with his amusing nonsense; he has given a series of interesting parallels of ideas and expressions common, as was natural, to the two leading minds of the Elizabethan age, Shakspeare's and Bacon's.

THE Thirty-fifth Report of the Deputy-Keeper of the Public Records has just been issued. The retirement of Lord Romilly from the office of Master of the Rolls since the publication of last year's report, furnishes the occasion for a graceful allusion to his lordship's efforts to promote the more extensive knowledge and use of the public records, and to his endeavours to forward the historical literature of Great Britain by the formation and printing of Calendars of State Papers, &c. Nor did Lord Romilly confine his services to the advancement of general history; he also rendered great benefit to the legal inquirer and local historian by abolishing all fees for searching and inspecting the public records. The circumstances under which the records of the Palatinate of Lancaster were removed to London were detailed by us early in the present year. In noticing the transfer Sir Thomas Hardy briefly narrates the history of the Palatinate from its creation in the year 1351, when Edward III. made Henry Earl of Lancaster Duke of Lancaster, and granted him certain rights within the county. Power was given to the Duke by charter to have his Court of Chancery, and to appoint justices to hold Pleas of the Crown, and other pleas touching the Common Law, with all other liberties and *jura regalia* pertaining to a County Palatine. In addition to the Calendars which are being prepared at Venice, Madrid, and elsewhere, by Mr. Rawdon Brown and Don Pascual de Gayangos, we learn that M. Armand Baschet is collecting and copying documents relating to British history in the public libraries and archives of Paris, while the Rev. Joseph Stevenson has obtained admission for a like purpose into the Vatican and other libraries

of Rome. The last-named gentleman reports that his work advances steadily and to his entire satisfaction, though the quantity of material is overwhelmingly large. An interesting account, by Mr. W. B. Sanders, of the facsimiles of national manuscripts of Ireland, photozincographed at the Ordnance Survey, Southampton, is printed in the appendix to the Report. The large transfers recently made to the Public Record Office, and the many proposals from different Government departments for other transfers, have compelled the Master of the Rolls to point out to the Treasury the necessity which exists for the immediate erection of another block of the repository. No steps have, however, yet been taken to carry out this object.

ALTHOUGH rich in ancient manuscript chronicles illustrating the piety, learning, wit and patriotism of her people, Ireland has few such records as State papers, charters, and other similar documents, compared with either England or Scotland. Of the eight charters which have been chosen for representation in the first volume of facsimiles of Irish National MSS., six form part of the magnificent collection of the Marquis of Ormonde, the hereditary Grand Butler of Ireland, being grants by Diarmait King of Leinster, Donnall King of Limerick, Earl Richard Fitz Gilbert, William of Braosa, Theobald Walter, and William Marischall, Earl of Pembroke. All these are in excellent condition, Braosa's especially having a very fine seal, and are of great interest if only for the famous historic names mentioned in them. The two other charters are furnished by the corporation of the city of Dublin, one granted by King Henry II. of England, the second by Prince John in the third year of the reign of Richard I. The Public Record Office of Ireland is represented in the same series by a fine membrane of a pipe-roll of the 44-46th years of King Henry III.'s reign. The remarkable collection known as "The Royal Letters" in the Record Office of England furnishes many specimens. One of these letters, evidently to be referred to the latter part of the thirteenth century, is from Nicholas Cusack, Bishop of Kildare, to Robert Burnet, Bishop of Bath and Wells and Chancellor of England, wherein he narrates how Gerald Tyrrell, a youth of noble birth, and of approved manners and skill in arms, had been taken prisoner in a conflict with the Irish, after all his comrades and his horse had been slain and he himself had been dangerously wounded. His captors had loaded him with chains and cast him into a dungeon, from whence they not only swear never to release him, but devote him to a cruel death unless the son of a certain Irish noble, formerly a tenant of Ilugh, Bishop of Meath, who is detained as a hostage in Dublin Castle, is given up to them in exchange. The concluding part of this letter has unfortunately been worn or torn off. It is dated on the Feast of the Decollation of Saint John.

NOTES OF TRAVEL.

WE regret to see recorded the death, at the age of seventy-four, of Dr. Charles T. Beke, F.S.A., whose name is well-known in connexion with recent researches in Arabia and Abyssinia. A very full notice of his life and labours occurs in the *Times* of Monday last, to which we are indebted for the following particulars:—

"From his youth Dr. Beke devoted great attention to ancient history, to scientific geography in connexion with it, and to the progress of geographical, ethnological, and philological studies. The results of his earlier enquiries were given by him to the world in his *Origines Biblicæ*, or *Researches in Primæval History*, the first volume of which was published in 1834. A stray assertion in this work identifying the 'Haran' mentioned in the Book of Genesis in connexion with Abraham with a site near Damascus led Dr. Beke to verify his opinion by a visit to the East in 1861. An account of this journey was published by him in the thirty-second volume of the *Journal of the Royal Geographical Society*.

"The observations made by Dr. Beke in his travels in the north-east of Africa, and a variety of local information gathered by him there, stand recorded in a variety of papers communicated to the Geographical Society by him and published in its *Journal*. In consequence of these results he obtained the gold medal of the Society in England and of the sister society of France.

"In 1848 Dr. Beke set on foot an exploring expedition for the discovery of the sources of the Nile, to start from Zanzibar, hoping ultimately to be able to descend the river and so reach Egypt, but the design was not carried out. He went, however, far enough to satisfy himself that Lake Nyanza was within the basin of the Nile; and generally it may be said that his views have been confirmed by the subsequently accomplished journeys of Burton, Speke, Grant, and Livingstone. As an independent worker in the same field with such men, it was not strange that he did not always agree with his contemporaries; and those who wish to read Dr. Beke's opinions on the subject of African exploration at full length will thank us for referring them to a volume, published by him in 1860, on *The Sources of the Nile*, and to a paper entitled 'On the Mountains forming the East Side of the Basin of the Nile,' which he read before the Geographical Section of the British Association, and published subsequently in the *Edinburgh New Philosophical Journal*.

"Subsequently to his return from this journey to Abyssinia, Dr. Beke took an active part in efforts to utilise the products of Upper Egypt and the parts bordering on Ethiopia, and repeatedly brought the subject of commerce with those countries under the notice of the Government and the public. In 1864 he offered his services to the Government to proceed to Abyssinia for the purpose of urging on King Theodore the necessity of releasing Consul Cameron and the other Europeans whom that monarch had imprisoned. The Ministry not being willing to take the matter up, he was induced to make the journey by the relatives and private friends of the captives. In this effort he was so far successful as to obtain their liberation, though after his departure the King again put them in prison. It was then, at last, that England took the matter up seriously, and the result was the Abyssinian War and the death of King Theodore.

"More lately the name of Dr. Beke has from time to time been brought before the public in controversies relating to the situation of Mount Sinai, and on other objects relating to the exploration of Africa. Recently he made an expedition for the purpose of visiting the true Mount Sinai, which he contended had not been identified by the Sinai Ordnance Survey Expedition."

A REPORT by Commander Cookson upon the guano deposits on the Islands of Lobos de Tierra, Lobos de Afuera, Macabi, and Guanape (in continuation of reports to the Admiralty relative to the deposits in Peru), has just been printed. At the time of the visit of H.M.S. *Petrel* to the first-named island there were no inhabitants, except a few Indian fishermen, from whom no information could be gained. The island is six miles long and in some parts three broad; the beds of guano there are a considerable distance apart, and are estimated to amount to 600,000 tons. The working of the guano there will shortly be commenced by the Guano Shipping Company at Macabi, and 100 Chinese labourers have already been sent to make piers and erect the necessary buildings. The same company has undertaken the working of the beds on the island of Lobos de Afuera, under a contract with the Peruvian Government, by which the company receives 85 cents per ton shipped, and defrays the expense of all the necessary works, such as building piers, laying tramways, making shoots, &c. The estimated quantity here is 500,000 tons. The labour employed by the Shipping Company is all Chinese.

It is stated that in 1849 a brother of King Coffee, named Aquasi Boachi, and then of about twenty years of age, lived at Vienna for several months. He was taken from Coomassie by some Dutchmen at the age of nine, brought up at Amsterdam, and afterwards sent to the School of Mines at Freiberg. He spoke three or four European languages, and showed much intelligence

and love of study. Not wishing to return to his country, he entered the service of the Dutch colony at Batavia, where he was found by the *Novara* expedition, holding the office of director of mines, and enjoying the respect of all with whom he was brought in contact.

ACCORDING to the most recent and careful calculations, the population of Japan amounts to 33,000,000. The country is divided into 717 districts, 12,000 towns, and 76,000 villages, containing an aggregate of about 7,000,000 houses, and no less than 98,000 Buddhist temples. Among the population are included 29 princes and princesses, 1,300 nobles, 1,000,000 peasants (about half of whom are hired labourers), and about 800,000 merchants and shopkeepers. The number of cripples is estimated at about 100,000, and there are 6,464 prisoners in confinement throughout the country.

WITH the object of improving the means of communication between Russia and Turkey, an agreement was entered into last year between the two governments to grant to a Dane of the name of Tityen a concession to lay down and work a submarine cable between Odessa and Constantinople. By virtue of this concession, Tityen formed a company, and on May 11 last the task of laying the cable was successfully accomplished. The line has since been thoroughly tried, and is now in working order, the charge being fixed at 14 francs for an ordinary message from any inland town of Russia to one in Turkey, and 12 francs from Odessa to Constantinople.

IN the list of awards at the Vienna Exhibition, there occurs this unpretending announcement: "A medal to the sailors engaged in the building of the Ar-men lighthouse." The *Bulletin Français* furnishes an explanation, and proves that the recipients of the medal are heroes in no ordinary sense of the word.

The mountain system of Brittany, as our readers may perhaps be aware, has a sort of continuation in a series of reefs and igneous rocks which jut out in a broken line westward of Finis-terre. On one of these rocks, called l'Isle de Sein, there stands a lighthouse, but the real danger lies to the westward and the rocks there have literally bristled with wrecks of vessels making for Brest. In 1860 the committee for lighting the coast of France decided to erect a lighthouse on the extreme end of the danger, and after a careful examination, M. Ploix the consulting engineer, decided on the Ar-men rock as the best site. At the same time he did not attempt to depreciate the prodigious difficulty of the task and characterised it as "nearly impracticable." The currents are so strong, and the sea runs so high that neither M. Ploix nor the other engineers, nor the director of lighthouses, was able to approach nearer than fifty feet. All they were able to ascertain was that the rock was gneiss, about eight yards across and twelve in length, and that it was just visible at low water. After settling their plan of operations, they applied to the fishermen of the neighbouring island of Sein, as most familiar with the locality and the danger, to commence the necessary works. These men undertook the task, and provided with life belts began to watch regularly for the best opportunity of landing on the rock. As soon as they got their chance, they crouched down on the rock, and clinging on with one hand, with the other worked away with a cold chisel so as to sink a sufficient number of sockets for the insertion of the iron clamps. Every now and then a wave would break over the rock, drenching them with foam and spray, and not unfrequently one of the party would be carried right off by the heavy sea, but would soon be picked up by a vessel kept purposely on the watch. At the end of the first season (1867) seven landings had been effected and eight hours work done, which sufficed for the sinking of fifteen sockets, while the following year the weather was more favourable, and forty new holes were pierced, some of

which were below water. In 1869 the blocks of stone were first placed in iron clamps about a yard long, rivetted into the sockets. The blocks were all hewn according to pattern and joined together with Parker-Medina cement. The work of dropping them into position was exceedingly laborious, owing to the violence of the sea; but two of the officials were constantly in attendance, urging on the workmen, and at the end of the season twenty-five blocks, each about a yard cube, had been successfully laid. In 1870 eight landings took place and eleven cubes were laid, and in 1871 as many as twenty-three, the work by this time becoming easier as further progress was made. A steam launch is now used for the conveyance of material, and a sort of masonry scaffolding having been built, the builders have succeeded, during the first half of this year's season, in placing in position no less than eighty-seven blocks. The expense, however (as may be imagined), has hitherto proved considerable. Each of the forty-five holes pierced during the first two years cost upwards of 2,000 francs, and on December 31 last the charges had amounted to more than 189,000 francs. The light is to be a revolving one of the first order, and 97 feet above high-water mark; there are to be seven stories in the house, and there will also be a steam whistle for use in foggy weather.

The names connected with this really grand achievement are the following: M. Léonce Renaud, director of the lighthouse service, the father of the project, and Messrs. Planchat, Joly, Cohen, Lacroix, and Probateau, the engineers and foremen; the names of the plucky sailors, who did the hardest part of the work, are, however, unrecorded.

PENDING the discussion, which is going on at the present moment, as to the expediency of carrying a railroad over the Simplon, the cost of which will, it is feared, be far more certain than its pecuniary success, an engineer of the name of Stamm has elaborated a scheme for connecting the valleys of Aosta and Chamoni by means of a line to be thrown over the spurs of Mont Blanc.

It is reported from St. Petersburg that in consequence of the representations of the Imperial Geographical Society, an expedition will be shortly organised by the government for the complete and scientific survey of the whole of Siberia. It is hoped that by the systematic barometric determination of the heights of mountain summits plains and valleys, considerable light will be thrown on the actual force of atmospheric pressure at the sea's level; while apart from general scientific questions, the survey may, it is hoped, prove of material advantage in reference to the future organization of railways.

THE *Temps* of the 5th instant contains an article, evidently from an authoritative source, on the "Tong-King question," which gives the history of the colonisation of French Cochinchina, the events which ended in the death of Francis Garnier, and the subsequent negotiations with the King of Annam. The treaty finally signed at Saigon, which has just been ratified by the French Assembly, opens to France three ports of the Tong-King, declares circulation in the interior and the navigation of the river free henceforward, and guarantees the exercise of the Christian religion. It thus realises in great part, though not completely, the object which Garnier had in view. He wished to give France the protectorate of Tong-King, and thereby to separate that rich country for ever from the Court of Huế; to paralyse Annamite intrigues in Lower Cochinchina; to ensure French domination over the whole eastern side of Indo-China, and the preponderance of French commerce in the interior of the peninsula and over the great market of Southern China. The writer hopes that time and the enlightened patriotism of the Governors of Cochinchina will realise so much of this splendid scheme as the untimely death of its author has left for the present unfulfilled.

An article by M. Henri Gaidoz in the current number of the *Revue des Deux Mondes*, on the use of elephants in war, is written in that lucid and interesting style which, as readers of the ACADEMY are already aware, is characteristic of the author. After sketching the history of the use of the elephant for warlike purposes from the time of Pyrrhus to that of Lord Napier, and summarising the literature of the subject from Aristotle to Francis Garnier, with remarks on the elephant's temper and capacities, M. Gaidoz suggests that as the dromedary and carrier pigeon have been utilised for military purposes, so also may the elephant. He argues that the experience of Inkerman and of the plateau of Avron shows that the employment of guns of heavy calibre may often decide the issue of a battle, and, while horses cannot be trusted to bring up heavy artillery at a moment's notice, elephants can, as English experience in India testifies. He urges, therefore, that a certain number of batteries of guns drawn by elephants should be added to the French army, the elephants to be caught in Cochinchina, trained in Algeria, and then transported to the South of France, where they would not suffer from the climate, and would be in readiness to act against the Germans at a moment's notice. M. Gaidoz meets the objections that may be brought against his proposal on the score of expense, health, practicability, and other grounds; but evidently despairs of his suggestion being realised, for "le peuple le plus spirituel de la terre en est en même temps le plus routinier." We must leave the discussion of the scheme to military experts, and can only thank M. Gaidoz for his entertaining and valuable contribution to the literature of the subject. We learn with some amusement that herds of elephants "adopt the monarchical principle, as is the case with all animals which form societies, man only excepted," and that in taming wild elephants we adopt "la méthode pédagogique, préconisée par Lancaster;" but it is with different feelings that we read that if Livingstone had had an elephant to ride "he would not have marched for days in the marshes in which he sank to his waist, and would not have contracted the disease of which he died."

SELECTED BOOKS.

General Literature and Art.

- BACON, Francis. *Life and Letters of*. Collected and edited by James Spedding. Vol. VII. (completing the work.) Longmans.

CORRESPONDENCE.

THE UTRECHT PSALTER.

British Museum: August 3, 1874.

In Mr. Pocock's article on the subject of the Utrecht Psalter in your last number, the Dean of Westminster is reflected on in respect to the notices of the facsimiles which accompany the British Museum Reports. I wish to explain that the Dean is not responsible for the notices. The

facsimiles were selected and described by myself, at the request of the publisher, in the Dean's absence abroad, and he had no opportunity of correcting the proof. With regard to the Psalter itself, it has not been my wish to appear as a champion of particular views, but simply to content myself with stating my opinion of the age of the manuscript as a duty forced on me by my position. But, as I have been led to address you, perhaps you will allow me to add a few observations on the Reviewer's conclusions.

As far as appears from the article, these are grounded mainly on the use of a particular character in the text of the Psalter, and on an opinion by a gentleman familiar with Eastern scenery, that the illustrative drawings are by the hand of a resident of Alexandria between 553 and 638 A.D. Now, it is fully admitted that, in itself, the use of that particular character for the entire text of a work is suggestive of an age before the eighth century, and only a strong contrary evidence could affect the presumption founded on it. But this is not enough for the Reviewer, who seems almost to insist that whatever may be the proof of later age, it should count for nothing unless supported by the production of a similarly written manuscript undoubtedly of the ninth century. Surely this is a position which may excusably be taken by one who is unaccustomed to the examination of rare manuscripts, and insensible to the many delicate differences which distinguish them; but hardly becoming one who sits in judgment on a difficult and disputed question of palaeography. He ought, at least, to have sufficient self-confidence to form an opinion from the evidence of the manuscript itself, marking every indication of age, one way or the other, and giving to each its fair weight. If, being familiar with manuscripts of various ages and countries, and accustomed to note their variations in method of arrangement, the colour of ink, the expression of the characters, and the tone and preparation of the vellum; and, on opening the Psalter, he had been struck with a contradiction in the ancient form of the letter used and the effect of later style in the use of it, together with a general aspect of a manuscript not of very great antiquity; he would at once be prepared to find that the older form of letters had been adopted, either for a special purpose, or from caprice, by a more modern scribe. But he would proceed to verify his first impression by a closer examination of details, to which his instinct would guide him. He would look to particular letters, to ascertain whether they had the peculiar forms which are known to denote antiquity; and he would find none, but on the contrary, later characteristics. He would enquire whether abbreviations of words were frequent or rare; and he would find them numerous as compared with manuscripts of great antiquity. He would look to the marks of contraction; and, instead of the simplicity which contented the scribe of more ancient times, he would find freely used at least two forms of late introduction, and growing into common use only after the eighth century. He would, moreover, be specially struck by the appearance of a form of abbreviation of one particular syllable, not met with in the earlier time but familiar to him in manuscripts after the same eighth century. He would test the method of punctuation; and again he would recognise a form not known to the earlier period. He would find a mixed use of characters—capitals and uncials—not proper to the older time. He would find first lines of the Psalms written in gold characters, precisely in the style of certain ninth century foreign manuscripts. And he would find at the beginning of the volume an ornamented initial letter exactly of the character, in form and colouring, with those found in the same ninth century manuscripts. But our palaeographer's attention would have been more early engaged by the interesting drawings which present themselves on almost every page of the manuscript. Here the effect would be

instantaneous. The style and manner of work in the majority of the designs cannot be mistaken, they are plainly Gothic and resembling those familiar to him in MSS. of the tenth and eleventh centuries.

Without following the progress of inquiry into further particulars, I would ask what conclusion ought an unprejudiced judge of manuscripts to come to on these results?

But, it is objected, the absence of early and presence of later forms in the letters may be disregarded: all the late characteristics may be and are of subsequent introduction—the initial letter may pass for one by an Irish hand, or perhaps has also been put in at a later time—and as for the drawings, they are very puzzling, but an accomplished art student has found out that they were put in by a native of Alexandria at some time previous to the destruction of that famous city. Now, in dealing with such objections and speculations, it is to be expected that the critic who sits in judgment should have had the means of satisfying himself of their force and probability. Has Mr. Pocock examined the Psalter itself with his own eyes? How else can he venture to endorse the extreme view which refers the several later evidences enumerated to an introduction two or more centuries after the writing of the manuscript. And how can he give its just value to the conviction derived from both the general aspect and nice criteria of the writing attested by those who looked at the manuscript with practised eyes?

And I must ask, is Mr. Pocock well aware of the force of evidence contained in the use of the particular form of contraction for the syllable *ur*? How, then, could he have fallen into the mistake of confounding it with the marks used for other abbreviations? He says:—

"It does not appear to us a violent supposition that where the same mark was made to do duty for so many different contracted syllables, it may have been used in extreme necessity for the termination *ur*, though, it may be, no other undoubted instances of the sixth century can be found to bear out the supposition."

Here is a revelation of an entire unconsciousness of the nature of the argument founded on the use of the contraction. I am surprised too at his doubt expressed as to the meaning of the term "Anglo-Frankish" school of ornamentation. I use it in reference to the introduction of the English into the Continental school under Charlemagne; a combination which led to a new era in the progress of the art. The English influence (itself derived from Irish practice), is obvious in the magnificent productions of his time and that of his successors.

I am averse from treating the question of the age of the Psalter at all controversially, and pass over points of discussion on which much might be said, if there were a hope of being listened to without irritation. What I would recommend to any who may feel an interest in the subject, and may wish to judge for themselves, is, that they take note of the peculiarities in the writing pointed out as commonly found in the ninth and later centuries, and trace them back, through the period of their casual occurrence to the first instances of their introduction into books of the class of the Psalter; and that, before deciding on the age and country of the drawings from the costume, forms of weapons and buildings, and nationalities of natural objects delineated, they familiarise their eyes with the examples preserved to us from the tenth and eleventh centuries—they will find few of the ninth; contrasting them with what survives of the sixth and seventh, and marking the strongly distinguished characteristics of the European and Eastern styles. If they will take this trouble, they will gradually settle into a very decided opinion about the Psalter without extraneous help.

It is not incumbent on a maintainer of the opinion of a late date to show why the writer adopted a form of letter grown into disuse for

entire manuscripts, though still much used for particular purposes. I have suggested that he was led to it by having to arrange for the introduction of the drawings which, in the original manuscript, extended across the page, and headed or followed the several psalms. A sufficient explanation would be, the desire to reproduce an unusually handsome manuscript in all its grandeur; as, in the time of Charlemagne, the nearly disused massive uncial character was revived in the production of the splendid golden books of which the British Museum possesses an example.

Whatever the motive may have been, it certainly was not in any degree for the purpose of forgery. The good monk who copied the manuscript and added the Creed, no more thought of forgery than did he who, in the Paris MS. of a collection of Canons, introduced the latter half of a creed similar to the "Quicunque," heading it with the explanation "Haec inveni Treveris," &c., obviously as something new to him. Nor would the form of the rustic capital be the slightest obstacle to the reading, for none can be plainer; and it certainly is infinitely more legible than some of the cursive forms in use in the ninth century.

EDWARD A. BOND.

SCIENCE.

The Paribhāṣhendusekhara of Nāgojibhatta.
Edited and explained by F. Kielhorn,
Ph.D., Superintendent of Sanskrit Studies,
Deccan College. (Bombay, 1874.)

THIS is a book which will not attract any notice beyond the narrow circle of Sanskrit scholars, and which even there will be appreciated by a very small minority only. It is, however, one of the few books published during the last fifty years that mark a real advance in the history of Sanskrit scholarship, and therefore deserves to be noticed in the ACADEMY. A study of native grammarians has long been recognised as a *sine quâ non* among earnest students of Sanskrit. It was no easy task to master the Sūtras of Pāṇini, so far, at least, as to be able to understand them, and to know the bearing of every rule, even without being able to give a full account of the intricate process by which the algebraic formulas of the old grammarian came to mean what they mean, or to unravel all the threads of that marvellous network which Pāṇini and his predecessors have thrown over the endless variety of the grammatical forms of Sanskrit. With Colebrooke's Grammar, however, with the Calcutta edition of Pāṇini, with Boehtlingk's edition and valuable commentary, with the *Siddhānta-Kaumudī*, and the *Laghu Kaumudī*, as translated by Ballantyne, a small number of scholars succeeded at all events in finding their way through the mazes of the Sūtras and Vārttikas, and were able to give chapter and verse for all forms, both regular and irregular, which occur in our own Sanskrit grammars. The best opportunity for a practical application and testing of Pāṇini's system was offered by Śāyana's great Commentary to the *Iṅg-Veda*, particularly by the first book. There, where every word had to be accounted for, where every change of letter, every accent, every termination, suffix, and prefix had to be justified by an appeal to Pāṇini, we could watch with the greatest advantage the working of that wonderful machine which stands before us in the grammar of the Indian schools, and which to my mind surpasses everything that human ingenuity has devised for analysing

the conglomerate of any language. The opportunity there offered for a study of grammar has not yet been sufficiently appreciated; and many a grammatical question, many a disputed point of accentuation, which has exercised the ingenuity of European scholars, might have been seen settled long ago in the pages of Śāyana's Commentary, so far at least as they can be settled in accordance with the theories of native grammarians. Lastly came the edition of the *Mahābhāṣya*, the great commentary, published by Rājārāma and Bālasāstrī, a most useful publication, for which Sanskrit scholars owe a debt of gratitude to those two learned natives. Rājārāma's name was already familiar to European scholars. It was he who sent me those most valuable criticisms on the first edition of my Sanskrit Grammar, which I was able to use for my second edition, and with reference to which I then said in my preface "that it seems almost hopeless for a European scholar to acquire that familiarity with the intricate system of Pāṇini which the Pandits of the old school in India still possess." The edition of the *Mahābhāṣya* will be a *monumentum ære perennius* both to him and to his colleague, Bālasāstrī, though we hope that ere long we shall have another edition of this important work, carried out according to the principles of diplomatic criticism, by which alone we can hope to gain a safe foundation for further speculations on the history of Indian grammar and the age of Pāṇini. Anyone who has worked his way through some of the more important chapters of that vast commentary might indeed imagine that he knew the system of Pāṇini, with the attacks directed against it by the Vārttikakāra, and the defence undertaken by Patanjali. But let those Vaiyākaraṇamanyas take up the book just published by Dr. Kielhorn, and they will be surprised at their own ignorance. We all knew that there were Paribhāṣās or general rules for Pāṇini's grammar, as there are for most Sūtra works, and we had seen them referred to again and again by the author of the *Mahābhāṣya*, as determining the form and meaning of Pāṇini's rules. But that these Paribhāṣās form the very foundation of Pāṇini, that they run through the whole of his work like so many sinews or nerves, holding the whole grammatical body together, and giving a kind of organic life to it, few scholars, if any, had any clear idea of. I freely confess my own ignorance of many of these secret springs of Pāṇini's engine, now laid open before us by Dr. Kielhorn; and I do not hesitate to declare his work, his edition, translation, and explanation of the *Paribhāṣhendusekhara* as an achievement which no other European scholar could have performed in so masterly a manner as he has. Dr. Kielhorn has, no doubt, enjoyed great advantages in India, and, like an honest man, he gives the fullest credit to those who assisted him.

"With all the valuable helps," he writes, "afforded by various commentaries, I should hardly have been able to accomplish my task, had I not been assisted in it by my learned friends and colleagues, Chintāmaṇi Śāstrī Thatte, Ananta Śāstrī Pendharkar, and the late Viṭṭhal Rāv Ganes Patvardhan. There is not a page, I might almost say not a line, in my whole translation, the contents of which have not been submitted

again and again to their criticism, and though I have honestly tried to form my own opinion and to judge independently in every difficulty, though I am ready to bear the blame for any errors or inaccuracies which I cannot hope to have escaped altogether, yet it would be wrong not to acknowledge here the great and invaluable benefit which I have derived from the learning and intelligent discussion of my fellow-teachers. It is sad to see the number of great Śāstris, distinguished no less for their humility and modesty than for their learning and intelligence, diminish year after year, and to feel that with them there is dying away more and more of that traditional learning which we can so ill dispense with in the interpretation of the enigmatic works of Hindu antiquity; but it appears to me all the more to be the duty of both native and European Sanskrit scholars to save as much as can still be saved, and to put in writing what in less than half a century will otherwise be irreparably lost."

There is the right ring in these sentences. Dr. Kielhorn is not a blind believer in the traditional learning of the Pandits. He knows what they alone can tell us, but he also knows what we alone can tell them. They have no idea of diplomatic criticism. Depending as they do on traditional teaching, they are apt to think lightly of MSS., and but seldom inclined to weigh their respective merits. Dr. Kielhorn knows that there is but one way of editing a Sanskrit text—namely, that which has approved itself, after repeated experiments, to classical scholars—which is based on a previous examination of all MSS., and on a genealogical classification of those which carry diplomatic weight. He also knows—and this is a most useful lesson for all Sanskrit scholars to learn—that Sanskrit authors never write at random. However intricate their grammatical discussions, their philosophical disquisitions, their legal arguments may be, we may be perfectly certain that if we do not see the thread of their reasoning, it is our fault, not theirs. They never play with words; they never drop a stitch. They may start from wrong premisses and arrive at wrong conclusions, but on the road from one to the other they never swerve. Many a time the explanation of the working of the Paribhāṣās must have seemed hopelessly involved to Dr. Kielhorn, as it has seemed to others before him. But he never gives in; he grapples with his difficulties till all becomes clear, till even the most mistaken application of one or the other of these leading rules has been rendered intelligible. This one important historical result may be considered as established by Dr. Kielhorn's work, that the majority of these general rules is presupposed by the whole structure of Pāṇini's edifice. Pāṇini, or whoever put the finishing touch to the collection of these grammatical rules, must have worked with a full knowledge of the influence exercised on the Sūtras by a certain class of Paribhāṣās. Of other Paribhāṣās we must speak more cautiously. Some of them Pāṇini may hardly have been conscious of, others owe their origin decidedly to the after-thoughts of later grammarians. It is hopeless to attempt to give to an outsider any idea of Pāṇini's grammar; it would be still more so to attempt to explain how that grammar rests on the foundation of the Paribhāṣās. Dr. Kielhorn must not expect many readers of his book, though it is evi-

dently the result of several years of hard labour. But he may have the pleasant conviction that he has done a work which no one could have done better, and that he has done it once for all.

MAX MÜLLER.

Du "C" dans les Langues Romanes. Par Charles Joret. (Paris: Franck, 1874.)

THAT phonology, the science of the linguistic relations of sounds, must be based on phonetics, the science of their physiological and acoustical relations, seems a truism; but the consciousness of the principle is so recent that we must highly commend M. Joret's attempt to put it in practice in this monograph—a history of the changes of the sound represented by the Romans by the letter *c*. Unfortunately his knowledge of phonetics appears to be entirely theoretical, and his preliminary account of sounds is taken bodily from the very imperfect work of Brücke, who shares in the failings common to most German phoneticians, of great want of observation, obtuseness of ear, and deficient control of the vocal organs. To point out its errors and omissions would be to write a treatise on the science; suffice it to mention that Spanish dental *s* (*z*, *c*) is identified with English *th*, modern Greek *θ*; and that *y* (German *j*) is regarded as the voiced form of German *ch* in *ich*, with the result of ignoring or misdescribing many of those guttural and palatal sounds (the Sanskrit palatals, among others) which bear an important part in the present investigation.

To M. Joret's want of phonetic training, and to the correlated ignorance of the phonetic phenomena of living languages, must be ascribed, to a great extent, the most serious defects of his work. If there is an error which an investigator who begins with a physiological description of sounds might be expected not to fall into, it is that of confounding sounds with the marks he employs to represent them on paper. Yet this confusion is constantly occurring in M. Joret's treatise, not because he is not perfectly aware of the distinction, but because he repeatedly forgets it; his phonetics are evidently not a constituent part of his philology, but something added to it, and which has never been assimilated. The three distinct questions, Into what Romanic sounds has that of Latin *c* developed? What sounds is the letter *c* used to represent in the Romanic orthographies? and, What Romanic letters are used to represent the sounds derived from that of Latin *c*?—of which the first only belongs to phonology, the others to orthography—are jumbled together in a way that requires the constant vigilance of the reader, if he wishes to avoid a similar muddle of his own ideas. Much of the confusion is also due to M. Joret's employing a score of conflicting orthographical systems of all degrees of badness, instead of one uniform and precise notation of sounds; he gives us on every page Latin orthography, those of each stage of each of the Romanic languages, and several more, with symbols often of uncertain value, for living dialects. How long will it take phonologists to learn from mathematicians those fundamental principles of symbolisation, that in every

investigation each sign must have but one value, however general, and that every difference in value which concerns the investigation must be noted by a distinction of sign? And it is precisely in the representation of the gutturals and their derived sounds that these orthographies are most inconsistent in themselves and with one another; we have *c* = *k*, *tsh*, *ts*, *s*, and dental *s*; *qu* = *kw*, *ku*, and *k*; *g* = *g*, German *ch*, *dzh*, *dz*, and *zh*; *ch* = *kh*, *k*, palatal *k*, *tsh*, *ts*, and *sh*; *sc* = *sk*, *sh*, and *s*; *sch* = *sk* and *sh*; *s* = *s*, *z*, and nothing at all; *z* = *dz*, *ts*, *z*, dental *s*, and nothing; *x* = *ks*, *tsh*, *sh*, *s*, *z*, and nothing; *j* = *y*, *dzh*, and *zh*. No better plan could be devised for suppressing the truth and suggesting falsehood about the subject of the work, the changes of the gutturals. Thus we are told that Latin *crescere* gives in Italian *crescere*, in Sardinian of Logodoro *crschere*, in Roumanche *crschere*. If the spelling is intended to do anything but deceive the eye, it means that the Latin word has remained unchanged in Italian, and has altered, in the same way, in Sardinian and Roumanche. The facts are, that the Latin word has remained unchanged in Sardinian, and has altered, in the same way, in Italian and Roumanche: Lat. *crescere* = Sard. *crschere* (with *sk*), different from Ital. *crescere* = Roum. *crschere* (with *sh*)! Of course, where we are not dealing with existing languages, but with their predecessors, a preliminary investigation of the orthographies with which they have been recorded is essential; but when we have ascertained as near as may be the value of the signs, to treat them as sacred is to sacrifice reality to appearance, with the results here mentioned. What meaning, for instance, does M. Joret attach to his own statement that "*s* and *z* represent the spirant at the end of words, where it is mute before a consonant"? that is, that they represent a specified sound which is no sound at all. Or to this, that "in the Romanic languages *h* has generally been retained only to preserve in some measure the original physiognomy of the word"? He must have forgotten that a word, being an invisible collection of sounds, has no physiognomy to preserve; and that the letter *h* has nothing to do with the Romanic languages, but only with the orthographies, or rather cacographies, with which people are taught to write them. Would that all M. Joret's confusions of thought and expression were harmless as these! But part of his subject is the history of the sound (or sounds) represented in Latin writing by *qu*, and for this it is essential to know what this digraph meant. We have searched, however, in vain to discover whether M. Joret thinks it represented simple *k*, *k* followed by *w*, or neither; or whether he thinks it had one value at the rise of the Empire, another at its fall.

Among several mischievous fallacies which M. Joret accepts, some consciously, others not, as self-evident or established truths, there is one which is the foundation of much of his theory, and to a great extent determines the arrangement of his book—in this respect very unfortunate. This is the belief that *k* before *e* and *i* is necessarily a different sound from *k* before *a*, *o*, and *u*; that it is

impossible, or at least unnatural, not to make the former on the hard palate, the latter on the soft. No practised phonetician requires to be told that this is a pure delusion; that supposed necessities of pronunciation are only national and personal habits; and that any sound whatever can be uttered immediately before or after any other sound, some of the apparently oddest combinations being really in use. A little accurate knowledge of living tongues would have saved M. Joret from this far-reaching error; in ordinary English, to take an easily-accessible instance, the variations in the formation of *k* according to the following vowel are hardly appreciable, the *k* of *keen* being no more distinguishable from that of *cool* than is that of *call*, and quite distinct from the German *k* of *Kiel*, when this is palatal. M. Joret also informs us that these two *ks* (why does he not distinguish the *k* of *ka* from that of *ku*, as well as that of *ki* from both?) are essentially primitive in the Aryan languages; apparently confounding the Sanskrit palatal sound which we absurdly represent by *ch* with the forward or hard-palate *k*, and ignoring the facts that in the Indo-Persian branch both sounds occur before all vowels, and that most of the other old (and many modern) Aryan dialects know nothing of the distinction. That before the splitting-up of Latin, *k* followed by *e* or *i* had become palatal, is quite possible; and that it was this before it became *tsh*, almost certain; but as it is still *k* (whether ordinary or palatal, who can tell without going to the island?) in one of the Romanic dialects (Sardinian of Logodoro *kerā*, *dulke*, *piskina*, as Latin *cēram*, *dulcem*, *piscinam*), the palatal stage is probably posterior to their separation. M. Joret's *a priori* assumption of course makes him entirely overlook this question, and calmly divide his subject into "velar *c*" and "palatal *c*;" so that to explain the numerous cases where *k* before *e* and *i* is vocalised instead of assibilated, he is forced to infer that the hypothetical palatal *c* of *facit*, &c., was changed into velar *c* when the following vowel was dropped, and only thus came under the usual Old French rule that velar *c* before a consonant becomes *z*. In other cases, however, M. Joret supposes that this palatal *c* did not revert to velar *c* when the following vowel was dropped, but became assibilated; we are told that "in *amicitatem* the fall of the short *i* before the accent having given *amicitatem*, the *c* is changed to *s*, giving in Spanish *amistad*;" also that "*plac(i)tum* would have given the series *placitum*, *plazido*, whence *plazdo* in Spanish, whereas *plac'tum* has given *pleito*." We will not presume to decide whether these statements are consistent with one another, not being sure that we fully comprehend either of them; but is it possible to involve a very simple matter in a greater fog? If M. Joret's division between velar and palatal *c* had not been in his light, would it not have been as clear to him as to everyone else, that in *amistad* from *amicitatem* *k* became *s* because it had time to be assibilated before the following palatal vowel previous to this being dropped; while in *pleito* from *placitum* it became *i* because the vowel dropped at an earlier period? This theory of M. Joret's, and his before-mentioned mistiness as to the value of Latin *qu*,

make him divide its sound also (whatever it may be) into velar and palatal, and consequently state, the *v* being apparently forgotten, that "although the palatal guttural has changed to *ç* (*tsh*), &c., in almost all cases, it remains in a certain number of words, especially those where it is represented by *qu*." Unless M. Joret thinks that Romanic pronunciation is based on Latin orthography, it must be a mystery to him why *qui que* did not share the fate of *cice*; in fact, the whole theory is a successful mystification of the familiar fact that in most of the Romanic languages the guttural has been assimilated only where it preceded an *e* (*ae*, *oe*) or *i*, which was not lost very early, and has remained unchanged, or changed differently, before other vowels and all consonants, as in *qu* (= *kue*). This is far from being the only case in which the preference of theory-making to consistency has caused M. Joret to overlook notorious facts, and consequently to abandon those rigorous methods of reasoning in which he claims to have followed the best of his predecessors. The failing is very noticeable in his explanations of the changes of *k* preceded or followed by another consonant; it is well known, for example, that in Old French *g* before *a* becomes directly *dzh* (*j*), whether the *g* be original or derived from *k* (*cambam*, *gamba*, *jambe*); but for the similar *déliçat*, *delyado*, *delyié*, he chooses to suppose that the *g* was first turned into *y*, and that it was this last which became *dzh*.

It is a pity that, not content with stating how and when Latin *k* changed in the various dialects, M. Joret attempts to give the cause of its changes. And by "cause" he does not mean such commonplace things as assimilation and laziness, but the metaphysical cause, by virtue of which the Latin-speaking inhabitants of the Roman empire were unconsciously compelled to substitute another sound for *k* in many words. Here is the result of his efforts as to the most general change:—

"These two facts, consonantising of the *i* and modification of the preceding consonant (*c*), hang together; if the second presupposes the first, the first no less presupposes the second to some extent, and both are the complex result of the disturbance which then occurred in the Latin phonetic system. But once this disturbance, which specially affected the gutturals, had been produced, there was no reason why palatal *c*—to speak only of this letter [*ç* sound]—should keep its original value before a simple vowel more than before the group *ia* or *iua*. Whence, in reality, comes its transformation? From the alteration made in the gutturals at the time of the destruction of the Empire. Until then the obstacle necessary for the production of the palatal guttural had been formed pretty well at the back of the hard palate, near the limit of the soft palate; it was now formed more forward, in the position where the true palatal *k* is heard; in again advancing this obstacle, one would naturally arrive at the sound *ç* (*tsh*), whether the *c* was followed by *i* and another vowel, or by a single *e* or *i*, accented or not. This is, in fact, what took place."

No doubt of it; but then it is not an explanation of the phenomenon, but a description of it; "the disturbance in the Latin phonetic system" is only a statement in general terms of the fact that *k* and other sounds changed; and to say that the transformation of *c* arises from the alteration made in the

gutturals, is to say that it altered because it did. It is painful to have presented to us by one who must be ranked among scientific men, these elaborate parodies of "l'opium endormit, parcequ'il a une vertu soporifique;" we can only hope that they may serve as a warning to philologists to avoid figurative language, and realise the meaning, if any, of their own words. It is to want of realisation that we must attribute such a statement as this taking the place of a search for the real reason:—

"When *c* is kept before a palatal vowel, it is because this vowel is not etymological; and it is then sometimes changed into *ç* (*tsh*) only because of the primitive value of the following vowel being forgotten."

But who is there to recollect it? Not the language, for that being neither animal nor spirit, but only a collection of sounds with associated meanings, has not got a mind. Then it must be the people who speak it; that is, an Italian peasant says *peccchi*, not *pecci*, because he remembers that his predecessors at one time—not within the last thousand years—said *peccis*, not *peccis* or *peccers*. We are glad to learn that popular instruction in Italy includes Latin accident.

M. Joret's knowledge of the antiquarian side of philology is generally competent, though that of the history of the English and other Teutonic gutturals is decidedly deficient; but some mistakes occur which betray carelessness, if not superficiality. His Old French quotations are often incorrect; he gives Spanish *negro*, with the usual *e* for the *i* of Latin *nigrum*, as a case of *e* caused by *i* arising from a guttural; and the Old High German *kuani*, with its Otfriedian diphthong *ua* for *uo* (N. H. G. *kühn*), is brought forward as an instance of *ku* = *qu* (*kue*), the *u* having no more to do with the preceding consonant than it has in *gruani* (N. H. G. *grün*). If his eight-page list of authorities were not proof rather of the number of books he has looked at than of the thoroughness of his reading, we should not have had him saying that, in the Anglo-Norman *Havelock* "the diphthong *ou* (*aou*)"—this *aou* shows that he means a real diphthong—"has developed beyond measure." The slightest study of the *Early English Pronunciation*, which is one of his authorities, would have shown him that it is one of Mr. Ellis's great points to have proved incontestably that then and much later, in England as in France, *ou* (where not for O. E. *ūw*, *ōw*) had the simple value it still has in the latter country, the change from the older *u* being one of orthography only, not of language. A more surprising mistake is that of making the *k* of the 3rd sing. perf. in Provençal, as in *vale*, derive from the Latin final *t* of *valuit*; the first person, which is also *vale*, had no *t*, and Diez long ago gave the perfectly satisfactory theory that in these cases the *u* of *ui* had been treated as a German *w*, giving *valqui(t)*, from which, with the regular dropping of the vowel and devocalisation of the consonant, *vale* would naturally arise.

It is fortunate that calling attention to a good point takes less room than exposing an error, for there are many of the former in M. Joret's book, and our space has limits.

The numerous word-lists are most useful collections of facts, though we could have wished some of them more exhaustive; and the inclusion of the modern local dialects, particularly those of the central group (North Italy, Switzerland, &c.), is a novel and valuable feature. The chapter on the history of the assimilated gutturals in Spanish and Portuguese is generally new and excellent; M. Joret proves from the spellings of MSS. and the descriptions of grammarians, that at one time Spanish *c* before *e* and *i* was equal to *ts*, and *z* to *dz*, the present confusion of both as dental *s* being quite modern. We would point out, however, that in Castilian they can never have been simple *s*, this and dental *s* being hardly ever interchanged. His examination of the development of Spanish *j* (*ç*, *x*), shows that the present remarkable sound is a recent alteration of *zh* and *sh*; and the investigation of the treatment of the gutturals in the Old French dialects brings out some unnoticed and important features. It has long been known that Picard had *k* (*c*, *qu*), where ordinary French had *tsh* (*ch*) not derived from *j*, and *tsh* (*ch*, *c*), where the other had *ts* (*c*); and M. Joret has now shown that Norman shared this peculiarity. Special praise is due to him for his utilisation of the old local charters and the modern dialects, including the proper names, as well as of the French words in English; it is only from careful work of this description that we can hope for a sound classification of the French dialects, and the researches of M. Joret have an important bearing on this thorny subject. His own opinions, however, are based too exclusively on the treatment of the gutturals to be convincing; by taking another well-marked feature, whether *ei* is kept, or changed to *oi*, our division would be very different, and M. Joret gives no reason for preferring his own test. It must not be forgotten that the classification of dialects which throws most light on the history of a language is genealogical, as is the scientific classification of plants and animals; that as a basis for it a conspicuous divergence must yield to a slighter one, if the latter took place earlier. On the cause of the remarkable special French change of *k* to *tsh* before *a*, these researches, as might be expected, throw no light; M. Joret tells us that if it were once palatalised it would easily become assimilated, which is quite true, but does not touch the real difficulty, why the guttural should be palatalised before a non-palatal vowel. He says, indeed, that:—

"If this modification does not appear in the Eastern group, it is because the languages comprising it have preserved more faithfully the primitive sound of velar *k*; the languages of the Western group, having less respected the velar guttural, were thus bound to change it; and it is not an effect of chance, but the consequence of the perturbation of the phonetic system of Latin, that the language which has most modified it is that which presents to us the most complete transformation of velar *c* into *ç* (*tsh*)."

But, as before, this is only telling us that sounds have changed most in the language in which they have most changed.

We have not attempted to discuss the numerous philological details on which M. Joret touches in the course of his investiga-

tion; though we can by no means accept all his conclusions—that assimilated *k* gave *dz* when final in Old French, for instance—his remarks very often require careful consideration, and the mere concentration of information on a few related points is a great advantage. There is in the book so much that is good, if often not as new as the author thinks, that it is greatly to be regretted that his logical and phonetic deficiencies have prevented him from making it attain the level demanded by the present state of linguistic science; but, in spite of its many and grave defects, it is a work which deserves to be read by every phonologist, and studied by all interested in the Romanic languages. HENRY NICOL.

The Ancient Stone Implements, Weapons, and Ornaments of Great Britain. By John Evans, F.R.S., F.S.A., Honorary Secretary of the Geological and Numismatic Societies of London, &c., &c. (London: Longmans & Co., 1872.)

(Second Notice.)

To revert to the fact of special types of stone implements occurring in certain localities, it seems that isolation was the principal cause of the development and perpetuation of peculiar forms. A special type of stone hammer found in the Channel Islands does not occur on the mainland. A peculiar form of broad stone knife which is common in the Shetland Islands is not known to occur anywhere else. The statement which Mr. Evans has copied from Dr. Daniel Wilson as to a number of them having been found in Blair-Drummond Moss in the valley of the Forth is unsupported by reliable evidence. A still more peculiar and puzzling set of implements (if such they be), formed of a greyish sandstone, and remarkable for their extreme rudeness, which have been found literally in cart-loads in certain places in Shetland, are not known to have occurred beyond the limits of the Shetland group, except in two isolated instances in Orkney. Mr. Evans has classified them, apparently with some hesitation, among his pestle-like implements; but their most striking characteristic is that the bulk of them show no signs of having been used in any way, and neither in their form nor finish do they present any indication of their adaptation for any conceivable purpose. They have been compared to the flint cores of Pressigny, but they are plainly not cores that have been worked for the resultant flakes. From their occurrence in such numbers in particular spots, they might be taken for the rough-hewn, and in great part the refuse blocks of a manufactory of celts, if there were not among them forms that are more club-like than celt-like. One of the most peculiar of these is a short, thick, bat-shaped implement with a well-formed handle. We can only say of them that they are local in origin and probably special in purpose; and though ruder than the rudest of Palaeolithic types they are not to be assigned unhesitatingly to a very remote period.

When stone was the common material for all cutting tools and weapons, a good whetstone must have been one of the most important of a man's personal possessions.

Accordingly, we find that it occurs very frequently in the barrows of the Stone Age. A neatly-fashioned form of smaller size, and perforated at one end for convenience of being carried about the person, occurs in tombs of the Bronze Age. But besides the whetstone, there was a larger kind of grinding-stone employed for producing the smoothed surfaces of the polished celts. The marks of this process, which many of these implements retain, are sufficient to show that they were rubbed on a grinding slab, and that the use of a revolving grindstone was unknown. Knives of flint, with ground edges, are among the rarest of stone implements. The rough, sharp edge of a flake was in fact keener and more effective than a smoothed edge. Awls, or boring-tools, made with a broad butt to be held between the finger and thumb, and probably used for boring holes in skins in the fabrication of dress, are not uncommon, but they are invariably unground.

The most elaborately finished of all the British forms of flint weapons—the arrow and spear head (differing only in their size)—are invariably formed by chipping merely. Yet the smaller varieties are often specimens of such dexterous manipulation and beauty of workmanship, that it is impossible to surpass them for the nicety of their finish and symmetry. Stone arrow-heads of other materials than flint are excessively rare in Britain. The flint forms may be classed as lozenge-shaped and leaf-shaped, always unbarbed; and triangular-shaped, which are sometimes furnished with barbs and stem or tang, and sometimes without either, but with a hollow worked in the base for insertion of the shaft. Specimens of ancient flint arrow-heads attached to the shaft are extremely rare, but those which have occurred—in Ireland, in Denmark, and in Switzerland—show that the head was inserted in the split end of the shaft and firmly bound by a ligature of gut, sinew, or bast. A peculiar form of arrow-head is a triangular chip of flint with the sharp base of the triangle outwards, and the apex inserted in the split shaft. Such a “chisel-pointed” arrow-head is figured by Madsen and identified by Mr. Evans. It was found in a moss in the island of Funen, and is still attached to its shaft by a ligature of fine bast-fibre. The same form of flint arrow-point occurs among the arrows recovered from Egyptian tombs. The general correspondence, not only of the forms of stone arrow-points, but of other varieties of implements and weapons found all over the world, affords another proof that in all places and in all times similar circumstances and similar wants, with similar materials only at command for gratifying them, result in similar contrivances.

None of the unpolished implements of flint are more abundant or more widely distributed than the so-called “scraper.”

“The typical scraper,” says Mr. Evans, “may be defined as a broad flake, the point of which has been chipped to a semicircular bevelled edge round the margin of the inner face, similar in character to that of a round-nosed turning chisel.”

The Esquimaux still use scrapers of flint, mounted in handles of bone, for dressing hides; and it has been supposed that this

was also the use of the ancient “scraper.” But the universality and abundance of the implements of this form may be otherwise accounted for. In examining them for evidence of wear, Mr. Evans found that evidence so various in its character as to point to the conclusion that the implements were employed in more than one kind of work. A very large number present an edge so battered and bruised that it can hardly have been the result of scraping in the ordinary sense of the term. And the discovery by Canon Greenwell of a nodule of iron pyrites, with a long round-ended flake of flint of the typical scraper form, laid beside the skeleton, in two instances, in Yorkshire barrows—the nodule bearing distinct marks of abrasion by the round-ended flake—establishes the truth of the deduction which had been previously made by Mr. Evans, that they were used as “strike-a-lights” with nodules of iron pyrites by the ancient Britons. Pyrites is as effective as iron for producing sparks with flint, and indeed was in use among the Romans. The lower beds of the English chalk are prolific of pyrites, and it is not improbable that the use of a hammer-stone of this material for working flint may have given rise to the discovery of this method of producing fire.

But so various are the applications of this primitive material of stone, alike in the arts of war and of peace, as well as for personal adornment of a rude kind, that it would require a treatise not less exhaustive than Mr. Evans's book to overtake them in detail. We find it employed equally in instruments for work or warlike use, from the earliest times in which we have traces of man's existence to the present day. We find it thus applied in all quarters of the globe, and in every variety of circumstances in which the human race has existed, in certain stages of its progress towards a higher civilisation. We find it used at different times and in different places for the strangest and most incongruous purposes—for all kinds of handicraft and implements of war, for skinning beasts, and for surgical operations, for shaving and for circumcision, for ceremonial observances of sacrifice, and for making incisions in the human body preparatory to its being embalmed. And when the true use of the implements of stone was superseded by the universal adoption of a fitter material, and their multifarious applications to the ordinary purposes of life were long forgotten, they were invested with supernatural qualities significantly suggestive of their ancient importance in the economy of life. Wherever they are found there still remains a lingering veneration for them as instruments of unknown origin and mysterious properties and powers. “Elf-bolts” and “thunderbolts,” “adder-stones,” and “pixies' grindstones,” in various linguistic disguises, are their popular names, suggestive of popular belief regarding them. Yet the objects so styled are simply representative forms (though of ancient date) of implements characteristic of representative sections of the human family, and the objects that have been for centuries regarded with superstitious veneration on certain highly civilised portions of the earth's surface, may be found in others that are less

civilised in the act of being fabricated and applied to the purposes of every-day life. It is certainly one of the most curious illustrations of the constant tendency of superstition towards the grossest absurdity, that we should have this veneration characteristic of the higher platform of civilisation only, and not of the lower. We can conceive the untutored savage regarding the death-dealing rifle with greater reverence and awe than the most terrible of all the gods of his fathers; but if it were not the fact, we could scarcely have conceived the converse, and believed it possible for the civilised man to cherish feelings of superstitious veneration for the stone axe and the flint arrow-point of his barbarian forefathers.

In concluding his review of the stone implements of the Neolithic period, Mr. Evans acknowledges that the results of his survey, so far as chronological classification is concerned, are by no means completely satisfactory. On this point he remarks:—

"It is true that regarding the various forms of objects described from a technological, or even a collector's point of view, the series of stone antiquities found in Britain does not contrast unfavourably with that from any other country. We have hatchets, adzes, chisels, borers, scrapers, and tools of various kinds, and know both how they were made and how they were used; we have battle-axes, lances, and arrows for war or for the chase; we have various implements and utensils adapted for domestic use; we have the personal ornaments of our remote predecessors, and know something of their methods of sepulture and of their funeral customs. Indeed, so far as external appliances are concerned, they are almost as fully represented as would be those of any existing savage nation by the researches of a painstaking traveller. And yet, when we attempt any chronological arrangement of the various forms, we find ourselves almost immediately at fault. From the number of objects found we may indeed safely infer that they represent the lapse of no inconsiderable interval of time, but how great we know not; nor in most cases can we say, with any approach to certainty, whether a given object belongs to the commencement, middle, or close of the Polished Stone Period of Britain."

If there is so little certainty in regard to the true classification of the objects of the "Neolithic period," the uncertainty is much greater when we turn to those objects which Mr. Evans describes as

"the relics of a still earlier period, when the art of grinding stone to an edge appears to have been unknown, and when man was associated in this country with a group of animals which has now for the most part disappeared, either by emigration to other latitudes, or by absolute extinction of the race."

It is, indeed, difficult to conceive of the existence of a race of men through the long periods implied in the "Four Ages of the Caves," and that of the River Drift, without their having attained to the simple art of grinding one stone upon another. It becomes still more difficult when we examine the group of relics from the caves, and find that the men who made them had acquired such high proficiency in smoothing, and adapting their implements of bone to their special purposes, and even in carving them with no inconsiderable artistic skill. Yet the fact remains, explain it as we may, that their flint implements, as a rule, are unfinished by grinding, while not a single implement from

the River Drift has been so sharpened or polished, either in whole or in part. But, as Mr. Evans remarks so frequently, "it is almost impossible to assign to individual specimens any chronological position from the form alone," and with equal candour and truth he also remarks in this very connexion, that it would be unsafe to affirm that the process of grinding was unknown when these roughly-finished implements were in use. Nor is there much greater certainty of chronological position obtained from the association of these rude implements with the remains of the extinct mammalia. And in the present stage of the inquiry, when so much depends on the correlation of geological evidences, so obscure and indeterminate in their nature as to lead to conclusions the most opposite among geologists themselves, it is obviously premature to deduce definite conclusions regarding the duration of the Cave and River Drift periods or their relative distances from our own time. It is better to have knowledge without belief, than belief without knowledge. Mr. Evans has given an admirable summary of the facts and the deductions as to their general bearing on the question of the relative antiquity of these rude relics of the earliest inhabitants of Great Britain, which we commend to the careful attention of all who are interested in the subject; but while we are grateful to him for thus systematising the knowledge of the facts, we are content to rest in the sure hope of more light from the caves and drifts before subscribing unconditionally to a creed so vague as "I believe in the antiquity of man." On this question it is but fair, however, that Mr. Evans should be allowed to speak for himself. Summing up the whole matter, he says:—

"On the whole, it would seem that, for the present, at least, we must judge of the antiquity of these deposits rather from the general effect produced upon our minds by the vastness of the changes which have taken place both in the external configuration of the country and its extent seaward since the time of their formation, than by any actual admeasurement of years or of centuries. To realise the full meaning of these changes almost transcends the powers of the imagination. Who, for instance, standing on the edge of the lofty cliff at Bournemouth, and gazing over the wide expanse of waters between the present shore and a line connecting the Needles on the one hand, and the Ballard Down Foreland on the other, can fully comprehend how immensely remote was the epoch when what is now that vast bay was high and dry land, and a long range of chalk downs, 600 feet above the sea, bounded the horizon on the south? And yet this must have been the sight that met the eyes of those primeval men who frequented the banks of that ancient river, which buried their handiworks in gravels that now cap the cliffs, and of the course of which so strange but indubitable a memorial subsists in what has now become the Solent Sea.

"Or again, taking our stand on the high terraces at Ealing, or Acton, or Highbury, and looking over the broad valley four miles in width, with the river flowing through it at a depth of about 100 feet below its former bed, in which beneath our feet are relics of human art deposited at the same time as the gravels: which of us can picture to himself the lapse of time represented by the excavation of a valley on such a scale, by a river greater, perhaps, in volume than the Thames, but still draining only the same tract of country?

"But when we remember that the traditions of the mighty and historic city now extending across

the valley do not carry us back even to the close of that period of many centuries when a bronze-using people occupied this island—when we bear in mind that beyond that period lies another of probably far longer duration, when our barbaric predecessors sometimes polished their stone implements, but were still unacquainted with the use of metallic tools; when to the Historic, Bronze, and Neolithic Ages, we mentally add that long series of years which must have been required for the old fauna, with the mammoth and rhinoceros, and other to us strange and unaccustomed forms, to be supplanted by a group of animals more closely resembling those of the present day; and when, remembering all this, we realise the fact that all these vast periods of years have intervened since the completion of the excavation of the valley and the close of the Paleolithic period, the mind is almost lost in amazement at the vista of antiquity displayed.

"So fully must this be felt, that it is impossible not to sympathise with those who from sheer inability to carry their vision so far back into the dim past, and from unconsciousness of the cogency of other and distinct evidence as to the remoteness of the origin of the human race, are unwilling to believe in so vast an antiquity for man as must of necessity be conceded by those who, however feebly they may make their thoughts known to others, have fully and fairly weighed the facts which modern discoveries have unrolled before their eyes."

JOSEPH ANDERSON.

NOTES AND NEWS.

THOSE who wish to study the controversy relating to the origin of the vertebrata will find in the *Revue Scientifique* a valuable paper by Professor Giard, of Lille. We can only mention the leading facts. In 1867 Kowalevsky announced that his researches into the development of the ascidians supplied the much-wanted connecting link between the invertebrate and vertebrate groups. He found that in the embryos of the ascidians the nervous system was formed as in the vertebrates from the superficial layer of the blastoderm, and the process of development resembled that in amphioxus, the lowest of the vertebrates. This discovery was generally accepted and confirmed, but disputed by Van Baer, whom Agassiz, in one of his last writings, complimented for having manifested a wonderful acuteness and "innersight" when weakened by old age and almost blind. Professor Giard analyses at length the objections of Van Baer, and controverts his doctrine that when animals fix themselves to any object so as to prevent their freedom of locomotion, they do so by their backs or dorsal surface, which is contrary to the observations of Darwin, Pagenstecher, and others. Having shown that no such law, or rule, exists, M. Giard confirms Kowalevsky as to the real position of the nervous system of the embryonic ascidians, and justifies Darwin's supposition that an ascidian may have been the remote ancestor of man. He remarks that we find in the ascidians a sort of dissociation of anatomical details united in the lower vertebrates, and again separated in the higher ones. "The dorsal chord of the ascidian larva, which is transitory and of little importance, becomes permanent and of high significance in the vertebrates. The ventral furrow developed in the adult ascidian is only an embryonic and transitory apparatus in the cyclostomous fishes (lamprey, &c.). This dissociation, which causes alternately the disappearance of this or that organ, destroying the general connexion and figure of the type, shows that morphology cannot resolve questions of this order without calling the new resources of embryogeny to its aid."

M. Giard mentions that sometimes the tail of the larval ascidian attains to a remarkable degree of organisation, so that it is impossible to distinguish it from that of a young fish, or batrachian. For example, the *Molgula socialis*, abundant at

Boulogne, exhibits a tail with rays. Other species of this genus have tailless larvae.

It was mentioned at a recent meeting of the French Academy that M. Ed. Piette had found a bone flute in the cavern of Gourdan, pierced with three holes, like those which Captain Cook found the Tahitians using.

ABOUT March, April, and May, and in corresponding autumn months, on fine evenings, after sunset in the former case, and before sunrise in the latter, a lenticular glow may be observed known as the zodiacal light, and forming part of a luminous envelope surrounding the sun, and extending beyond the orbits of Mercury and Venus. It is only well seen in this country when the air is exceptionally clear, as the Rev. F. Hawlett found it at 8.15 p.m. on March 25 of this year. Sir J. Herschel conjectured it to be composed of multitudes of small bodies, and "loaded perhaps with the actual materials of the tails of millions of comets, of which those bodies had been stripped in their successive perihelion passages." Spectroscopic observations by Liais, Piazzi Smyth, and Anderer gave a continuous spectrum like that of weak sunlight. Recently Mr. Arthur Wright, using an exceedingly sensitive quartz plate in the collection of Yale College, in the construction of a very delicate polariscope, found from 15 to 20 per cent. of the zodiacal light polarised in the direction of a plane passing through the sun. The spectrum did not materially differ from that of sunlight of the same intensity. From these facts it appears that the zodiacal light comes from the sun, and is reflected by solid bodies moving in an orbit round the sun.

A RECENT number of *Der Naturforscher* gives an account of experiments on phosphorescent wood related by Herr Ludwig in an inaugural address at Hilburghausen. Like other observers he traced the luminosity to the mycelium threads of a fungus; and using a micro-spectroscope in a dark room, he saw a group of dark lines in the blue, and a broad absorption band in the violet. Temperature had a considerable influence on the luminosity: at 4.5° C. it was weak, dull even at 10° C., brighter from 18° to 20°, brightest from 25° to 30°; after which it grew weaker, and vanished at 45°, but being moistened as it cooled, the light was renewed. Placing a portion of wood bark with mycelium growing in it, in a eudiometer, he found two cubic centimetres of oxygen absorbed in six hours. He was not able to add any fresh information concerning the relation of the phosphorence to the growth of certain species of fungi.

THE same journal copies from the *Archives Néerlandaises* an account of hybrid fruits found in a package of citrons. Five had a colour and taste resembling citrons, while four were more like oranges. Messrs. Oudermans, into whose hands they came, planted the few seeds they found, but no development occurred. They think it most likely that these hybrids came, not from a tree of crossed character, but from either a flower of *Citrus medica* being fertilised by pollen from *C. aurantium*, or vice versa, the former being the most probable.

DURING some recent excavations at San Juan de los Morros, in Venezuela, for the purpose of improving the exterior of the sulphur-baths of that village, a number of bones were found which, on being submitted to Dr. A. Ernst, were identified as belonging to the *Mastodon Andium*. Dr. Ernst contributed four papers on the subject to *La Opinion Nacional* of Caracas, last month, and is preparing a detailed scientific description of them. These relics of the fauna of the Old World are looked upon by the common people as remains of the antediluvian giants. Thus a place at Bogotá, where many bones of the mastodon have been found, is called *El Campo de los gigantes*.

AN association numbering upwards of 300 members, and including entire families, has been formed at Stuttgart under the Presidency of Pro-

fessor Zech, for the purpose of carrying out the principles of cremation in opposition to burial of the dead.

THE list of new members of the Academy of Sciences at Munich includes the names of Ismail Pacha, Viceroy of Egypt; Gaston Paris, professor of the Romance Tongue and Literature at the Collège de France in Paris; Dr. F. Kielhorn, superintendent of the Sanskrit classes in the Deccan College at Poonah; and Dr. Paul du Bois-Reymond, Ordinary Professor of Mathematics at the University of Tübingen.

IN accordance with a new regulation, all schoolmasters in Bavaria are to add to the statistical tables, already required from them in their official reports, notifications as to the colour of the eyes, hair, and skin of the children in their schools. From the earliest of these reports, as given by the schoolmaster of Ansbach, it would appear that among 1,500 children, there were about an equal number of gray, blue, and black eyed individuals, while in regard to complexion, the percentage was about eighty light to twenty dark skins.

PROFESSOR SILVESTRI, who recently passed two nights and two days on the summit of the crater of Mount Etna, prognosticates a strong and not very remote eruption of the mountain. Last May, the volcano, which for five years had been entirely tranquil, first gave signs of renewed activity, which have continued to the present time with few or no intermissions. According to Professor Silvestri, these phenomena, which include subterranean thunderings and vivid flashings of light, are due to the sudden explosion of gases, moving in circular lines, to the eruption of burning substances which fall back into the crater with loud noises, and the shooting forth of scintillating ashes from every crevice and crack in the walls of the crater. A general impression prevails in the neighbourhood that new craters have been formed, and eruptions are said to have been noticed on the Bronte side of Etna; but as yet the phenomena have continued to be locally circumscribed by the older boundaries of the mountain, and no definite change has taken place in the outline and form of the entire mass.

ACCORDING to the report presented to Congress before the close of this year's session, there are in the United States 66,237 miles of railways, the combined cost of which amounted to 3,000,700,000,000 dollars. The capital invested in railroads is moreover upwards of twice as great as the sum representing the national debt. The relation between the mileage of railways and the population was, in 1873, in the ratio of one mile to every 582 persons.

THE association organised at Bremen for the promotion of German Arctic Explorations has issued the closing part of the *Description of the Second German North Polar Expedition in 1869-1871 under Captain Karl Koldewey*. (Leipzig: Brockhaus, 1874.) The admirable maps and numerous coloured plates with which this work is illustrated, and the large amount of scientific information which it imparts in regard to arctic exploration generally, render it one of the most useful publications of its kind.

THE Sanitary Commissioner with the Government of India has recently published the second and third volumes of the *Vital Statistics of the Bengal Presidency*, by Dr. James L. Bryden, which consist of the Statistical Standard for the European Army for the ten-year period 1860-69, and a Record of Epidemic Cholera from 1817 to 1872. The first volume, published in 1871, contained Annual Returns of the European and Native Armies, and of the Jails, from 1858 to 1869.

MR. JOHN WATERHOUSE, F.R.S., has printed for private circulation a thin quarto volume, entitled *Eight Years' Meteorology of Halifax, being a Record of Observations taken at Well Head during the years 1866 to 1873 inclusive*. The

results of the observations are reduced in thirteen tables, one of which contains the Readings of the Rain Gauge from 1829 to 1873.

THE Monthly Notices of the Papers and Proceedings and the Report of the Royal Society of Tasmania for 1872, have lately arrived in England. It appears that the Society's Gardens were visited by 24,000 persons, and the Museum by 14,956 persons during the year. The Society receives a government grant of 400*l.* for the gardens, and one of 200*l.* for the museum. The Proceedings contain a notice of a monster cuttle-fish found in New Zealand, one of whose feelers was fourteen feet, and the others eleven feet long.

THE Royal Observatory of the Brera at Milan has just issued as the third number of its publications a paper by Signor G. V. Schiaparelli on the Precursors of Copernicus among the Ancients, which was read last year by the author on the occasion of the four hundredth anniversary of the birth of Copernicus.

THE last part of the Transactions of the Senckenberg Society of Frankfort-on-Main contains a paper by Emil Stöhr on the Province Banjuwangi in East Java and its Group of Volcanoes, which is illustrated with eight plates. The part also contains a paper on the Reptiles of Morocco and the Canary Islands, by O. Böttger.

THE energetic director of the Russian Central Physical Observatory at St. Petersburg, Mons. H. Wild, has lately published the Annals of the Observatory for the year 1872, a volume of 780 pages, containing observations from all parts of the empire; Reports of the Observatory for the years 1871 and 1872; and the third volume of the *Repertorium für Meteorologie* for 1874, a collection of eight papers on meteorological subjects of interest by Wild and others.

Journal of Anatomy and Physiology, No. XIV, May, 1874.—The present number contains no less than twenty-one original articles, besides the usual notes on anatomy and physiology and cognate subjects. Among the more important are: 1. Professor Binz on Some Effects of Alcohol on Warm-blooded Animals. He states that the impression of heat felt after taking alcohol is only subjective, and is not perceptible by the thermometer. Moderate doses cause lowering of the temperature of the blood amounting to 3°.5 or 5° Fahr. Alcohol diminishes the metamorphosis of tissue and consequently decreases the urea and the carbonic acid. The answer to the question whether alcohol is a food depends on circumstances. It is not required to sustain life under ordinary circumstances, but is useful when through any cause, such as cold air or feverish excitement, an increase of our tissue metamorphosis arises. 2. Dr. Blake describes the action of certain inorganic substances when introduced directly into the blood, as lime, strontia, baryta, and lead, and shows that in the same isomorphous group, intensity of physiological action increases as the atomic weight of the elements. 3. Professor Cleland describes some double-bodied monsters. 4. Dr. Reyher gives the results of his investigations on the cartilages and synovial membranes of the joints. 5. Dr. Resch on the Acidity of the Gastric Juice, which he attributes to hydrochloric acid, secreted chiefly at the cardiac extremity of the stomach, though mingled in the dog with some lactic acid. 6. Professor Turner gives some details of the anatomy of the Greenland Shark, and also gives a paper on variation in the arrangement of nerves, another on the convolutions of the brain, and a fourth on the placentation of the sloths. 7. Mr. Savory on the Ligamentum Teres. 8. Dr. Radcliffe, The Synthesis of Motion. 9. Professor Crum Brown on the Sense of Rotation and the Anatomy and Physiology of the Semicircular Canals of the Internal Ear. 10. Dr. Brunton on the Effect of Warmth in preventing Death by Chloral. 11. Mr. Champneys on the Septum Atriorum of the Frog and Rabbit. 12. J. C. Ewart on the Epithelial Arrange-

ment in front of the Retina, and on the External Surface of the Capsule of the Lens.

Zeitschrift für Biologie, Band x., Heft 1.—This part contains—1. Researches on the Formation of Fat in the Animal Body, by H. Weiske and E. Wildt. 2. Physiological Spectrum Analyses, by K. Vierordt. 3. On the Absorption of Vegetable Mucus and of Gum from the Intestine into the Fluids of the Body. 4. Substitution of Lime in the Bones, by Dr. J. König. 5. Researches on the Conduction of Heat by the Skin, by Dr. Ferd. Klug. 6. On the Digestibility of the Gelatine-yielding Tissues, by Dr. Johann Elzinger. And lastly, a paper by E. Bunge on the Value of Common Salt and the relation of potassium salts in the human organism from an ethnological point of view.

New York Medical Journal, vol. xix., No. VI.; contains a good article on the Mechanism of Hearing, by Albert H. Buck; and another, by Dr. J. C. Dallon, on the Spectrum of Bile.

THE sixth annual session of the American Philological Association began at Hartford, U.S.A., on Tuesday, July 14, at 3 p.m., in the High School building. After short addresses of welcome from Professor Wm. Thompson and Mayor Sprague, of Hartford, papers were read by Professor S. S. Haldeman, of Pennsylvania, on "An English Vowel-mutation" (*a* and *e*, as in *cag*, *keg*; *mash*, *mesh*); by Professor W. W. Fowler, of Durham, Connecticut, on "Paradoxes in Language" (words from the same root, with opposite meanings, as *black* and *bleach*; *glow* and *gloom*, &c.); by Professor F. P. Brewer, of South Carolina, on "A Leaf of a Latin MS. found in the binding of a book, a fragment of a Code of Regal Laws, probably from Italy." At the evening meeting, at eight, the President, Professor F. A. March, of Lafayette College, Easton, Philadelphia, read his address. The three great facts of the past year were the completion of Pott's great *Lexicon of Roots*, the foundation of the English Dialect Society, the publication of M. Lenormant's *Grammar of the Speech of the Primitive Population of Babylonia*, which promised to do for the Turanian family as much as Sanskrit had done for the Indo-European. Besides these, many other valuable books had been published, and much good work done. Celtic studies had been firmly established in England, France, and Germany; Cleasby and Vigfusson's *Icelandic Dictionary* had been completed, and the Early English Text Society had produced the last of the texts of William's *Vision of Piers Ploughman*, with a new volume of most welcome Anglo-Saxon Homilies. The reform of Latin and Greek pronunciation was also proceeding. Professor March then dwelt on the hindrances that our absurd English spelling put in the way of learning, and urged the adoption of a universal alphabet. He noted certain changes now going on in the formation of words and phrases, and contended that these might well be, and ought to be, guided and controlled. Hence he urged the aesthetic cultivation of speech by writers and speakers generally, and specially the cultivation and simplification of scientific language, so as to draw technical terms near the popular speech in those qualities which are valuable in it; simplicity, brevity, harmony, natural and truthful relations in sound and sense to the roots of speech; thus making technical terms grateful to the cultivated literary sense, and ensuring them the welcome that we give to a happy revival of a word in Chaucer, or a cunning grace of novel application in Tennyson or Emerson. Here Professor March praised the new vocabulary that Mr. A. J. Ellis has invented for his late able mathematical treatise. The Professor further argued for the improvement in education that must result from the advance of philology; he urged the study of the early Christian writers in Greek and Latin, and lamented that our children should spend years on the faint Homeric echoes of Virgil, the graceful epicureanism of

Horace, and never see the *Dies Irae*. He regretted also the death in life in English Literature, the depressing tone of Tennyson's wail over the vanished heroes of old time, and the death's head in every flower of Morris's *Earthly Paradise*, such a contrast to the exultant lyrics and orations on which the American youth have been hitherto reared. Lastly, Professor March argued that with the advance of the science of language, the discovery of its laws—laws of the mind and history of man—must come a great and beneficial change in the methods of psychology and the philosophy of history.

The association met three times a day, and the following was the programme for its first day's regular work:—

MORNING.

1. The Propositions in the Homeric Poems; by Professor W. S. Tyler, of Amherst College.
2. The Greek Subjunctives; by Professor J. B. Sewall, of Bowdoin College.
3. On a Passage in the Odyssey; by Professor L. R. Packard, of Yale College.
4. The Authenticity of the Documents in Demosthenes on the Crown; by Professor M. L. D'Ooge, of the University of Michigan.
5. Aristotle; by Thomas Davidson, of St. Louis, Mo.

AFTERNOON.

1. The Character of the Latin of the Vulgate; by Professor Charles Short, of Columbia College.
2. The Proportional Elements of English Utterance; by Professor W. D. Whitney, of Yale College.
3. Numerals in the Language of the American Indians and the Indian Mode of Counting; by Dr. J. Hammond Trumbull, of Hartford.
4. The Pronunciation of German Vowels; by the Rev. C. W. Ernst, of Providence.

EVENING.

1. The Origin and History of the Word Philanthropy; by Colonel T. W. Higginson, of Newport.
2. The Falache Language of Abyssinia; by Dr. C. H. Brigham, of Ann Arbor, Mich.
3. The Hebrew of the Bible and the Arabic of the Koran; by Bishop Julius Ferrette.

THE first volume of the Berlin Numismatic Journal (*Zeitschrift für Numismatik*, Herausg. Dr. A. von Sallet) is now completed. The fourth part opens with a notice by Dr. Friedländer of the acquisitions made by the Berlin Museum during last year. A great part of this notice is filled, as might have been expected, by a rather lengthy account of the Fox collection purchased in 1873 by the Museum. It appears that the Berlin collection has now outstripped, so far as Greek coins are concerned, all other collections, with the exception of those of London and Paris. It now contains about 160,000 coins, of which 44,000 are Greek (860 gold, and nearly 14,000 silver), 31,000 Roman (1,670 gold, and 14,500 silver), and about 85,000 mediæval, modern and oriental. The next paper is by the editor, Dr. von Sallet, on the most ancient tetradrachms of the Arsacids. The same numismatist also contributes an article upon the coins of P. Helvius Pertinax Caesar, the son of the Emperor Pertinax, in which he asserts the genuineness of the coins, and brings inscriptional evidence to the fact that young Pertinax received the title of Caesar. P. Lambros, in a short paper entitled "Unedirte Münze von Tenea" publishes the first known coin of that city, a brass piece, struck at the time of Septimius Severus, bearing the name of Julia Domna. Dr. Imhoof-Blumer contributes "Numismatische Berichtigungen," or corrections to Hunter's Catalogue, to Taylor Combe's *Veterum populorum et regum numi qui in Museo Britannico adservantur*, and to Leake's *Numismata Hellenica*; to which he adds a notice of fourteen coins of the Phrygian city Kibyra. L. Meyer describes four inédited coins of Asia Minor. P. Brock, of Copenhagen, contributes an interesting paper on "Probable Witnesses to Wendic Influences in Denmark." "The Coin-Find of Dobra" (a village in the district of Plock, in Poland), by H. Dannenberg, is a list of 123 mediæval and modern coins. The section of "Miscellen" comprises a short obituary

notice of Louis Sambon, the author of *Recherches sur les Monnaies de la Presqu'île Italique depuis leur Origine jusqu'à la Bataille d'Actium*, who died in October, 1873; also a few short articles by Th. Mommsen, von Sallet, and Dannenberg, on various subjects. Under the heading "Literatur" we find a very slight review of Brandis's Essay on the "Decipherment of Cypriote," by Dr. von Sallet, in which the reviewer confines himself to the numismatic bearings of Brandis's labours. There are several other reviews, among which we may mention those of De Saulcy's *Numismatique de la Terre Sainte*, of De Rougé's *Monnaies des Nomes de l'Égypte*, and of Friedländer and von Sallet's Catalogue of the Select Exhibition of Coins at Berlin. The number concludes with remarks by Dr. Friedländer on De Saulcy's last work on the *Coins of the Holy Land*.

FINE ART.

THE PRINTS AFTER SIR JOSHUA REYNOLDS.

A Catalogue Raisonné of the Engraved Works of Sir Joshua Reynolds, from 1755 to 1820. By Edward Hamilton, M.D., F.L.S., &c. (London: P. & D. Colnaghi & Co., 1874.)

THE prints after Sir Joshua have always been favourites with one class or another of the buyers of pictures. They were bought during the painter's life much as common photographs are bought by the many in our own day: not of course so extensively: that could not be, since there existed neither the supply nor the demand; but the prints were bought then, there can be little doubt, with little general appreciation of their artistic value. They were bought—and happy was the generation that could buy them—where flashy popular prints are bought to-day. Reproduction by means of mezzotint engraving was the fashionable process for reproduction and multiplication at the moment. The great engravers of that day hardly knew themselves that they were great. The generation that lost them had to find that out. The generation that kept them, paid them for their work; and work paid for at the moment—work with a market value—is not generally held to be immortal at the time that it is produced. Sir Joshua himself was however one of the first to recognise the surpassing merit of these mezzotint engravings—the surpassing excellence which the method had then attained. Looking at a print by McArdell, after one of his works, he said "By this man I shall be immortalised!" When he said that, was he thinking solely of the excellence of the print, and of its wide publication; or was he foreseeing the day when so much of the charm of the colour of the work of his own hand should be gone?—when time should have ruined, or at the least damaged, too much, and when a very great deal of his reputation should have to rest on other men's transcripts and translations of his works.

Transcripts, even more than translations, they may indeed be called; for many of them reproduce the touch with a fidelity second only to that with which they reproduce the subject. Accordingly, they become more and more highly valued—their money value has never increased so fast as within the last few years—and this is a thing which no one can regret; for, as Dr. Hamilton remarks in the preface to his new Catalogue, "to possess

such works is to live with Reynolds and his times; to study them is to nourish and improve the taste." To us, too, they have all the interest of an art that is peculiarly English. If we are first in water colours, we are almost alone in mezzotint. The art, if not of English invention, is essentially of English practice. Mezzotint engraving, pure and simple, reached its highest point when the best of these works after Sir Joshua were executed. That was chiefly during the last thirty years of the eighteenth century. Some of the engravers lived on a good many years into the nineteenth. One or two of them took part, in the early years of the nineteenth, in that combined work of etching and of mezzotint by which, between 1807 and 1819, the great *Liber Studiorum* was produced. But the work in pure mezzotint, executed during the last part of the last century, was the finest thing any such work could be, and was the best of all possible means for conveying the quality of Sir Joshua's paintings—subject, spirit, and touch. Only when we hear of exceedingly high prices being given for certain of these prints—favourite subjects, to begin with, and very rare besides—do we venture to ask whether, as Fine Art, they are worth an outlay quite as great; for remarkable as are their qualities, it must be remembered, that unlike the prints of *Liber Studiorum*, they are wanting in the severe beauty and value of *line*. That, of course, mezzotint, pure and simple, can never have. The whole process forbids it. Turner got that by his etched work in *Liber Studiorum*, and of most etchings proper it is a very high and peculiar property. But *Liber Studiorum* is well-nigh the only work which combines the supreme softness and richness of mezzotint with the beauty of *line*, now fine, now strong, which is at the command of a great etcher.

Many of the men who practised mezzotint engraving were themselves artists. Hodges, the engraver of the *Contemplative Youth*, of *Lady Dashwood*, and of several of the best male portraits after Sir Joshua, was a portrait painter of much distinction. He spent many years in Holland (Dr. Hamilton tells us), and is there considered as a Dutch artist. Richard Houston was a miniature painter. S. W. Reynolds began as a landscape painter. But, generally, the greater masters were engravers alone. None are greater than McArdell, James Watson, and J. Raphael Smith. But it would be rash indeed to assert that these, with Hodges—or, better, say with Valentine Green—exhaust the list of the greatest, when the greatest have to be chosen out of a company numbering one hundred and three. But McArdell has special claim to be mentioned, since Sir Joshua appreciated his work so highly. Like other great mezzotint engravers, he was an Irishman. And Watson, amongst many other fine things, engraved *Mrs. Abington as the Comic Muse*. (Mrs. Abington was the original Lady Teazle.) And J. Raphael Smith produced a host of the finest engravings: masterly in technique and in spirit. None of them is finer than his rare print of *Mrs. Carnac*, of which a proof is known to have been sold for little less than a hundred guineas. To see this

along, say, with the print of Emma Hart (afterwards Lady Hamilton) as a *Bacchante*, or with the print of the *Honourable Miss Bingham* (a pretty thing, by Bartolozzi, but as an engraving not so great), or with the *Miss Jacobs*, by Spilsbury, or with the *Nelly O'Brian*, is indeed to quaff, as from its very source, "at such a magic cup as English Reynolds once compounded."

Perhaps of all these engravers, Raphael Smith was the first. He executed more than forty plates after Sir Joshua—men, women, children: an archbishop, a dancer, a woman of the great world. He began his work young: much of that which is most famous was done before he was thirty years old. He was a relative of George Morland's, and often helped that gifted scapegrace in his pecuniary and other difficulties. He engraved altogether one hundred and fifty plates, and died, hardly an old man, at Doncaster, in 1812. But it is impossible to follow in a review the history of the various engravers, which Dr. Hamilton has given in a concise form at the end of the catalogue proper. Moreover, the work of very many of the engravers has long ceased to have any general importance. Many persons who happen to be wholly unversed in these things imagine that any mezzotint after Sir Joshua is a possession of present value. That is a mistake. The inferior prints can hardly share in the benefit of the popularity of the greater ones. Among the mass there are a goodly, but still a limited, number, which amateurs, connoisseurs, and collectors recognise, study, and possess.

The catalogue proper is divided into three parts, of which one is devoted to a record of the male portraits, another to the female portraits, and another to the miscellaneous subjects. The author has given biographical particulars of the sitters, the like of which we believe no one before has attempted to afford. Each picture is described. Its date is given whenever that is possible, and also the place of its present abode. Thus much more has been attained than has been attained in any previous catalogue. Of these there are four. The first, which has been the foundation for all the others, is Richardson's: published a very short time after Sir Joshua's death. The second, which we have not seen, Dr. Hamilton describes as almost a reprint of Richardson's catalogue, with the addition of the prices at which the engravings were originally published: "these prices ranged from two and sixpence to thirty shillings, according to the size and state of the plate." The third catalogue was published in 1825, by Wheatley in Leicester Square; but that is merely a reprint. Finally, Cotton, so lately as 1857, compiled a Catalogue of the portraits painted by Sir Joshua; and this gave also the names of the engravers, the dates, and the names of the possessors of the pictures. In Dr. Hamilton's own work, some old mistakes are corrected; but the task has been a laborious one, and has not itself been accomplished wholly without error. Thus the portrait of Sir Joshua Reynolds when a young man (engraved by S. W. Reynolds) is said to have been engraved in 1796. The majority of the impressions may have been engraved at that date; but the British Museum possesses a copy

engraved (and we have seen one elsewhere) a year earlier—in 1795. Again, it is perhaps by a misprint that Watson's engraving of the girl-child Beauclerc, is described as in mezzotint. Is it not in stipple? On the other hand, one or two "omissions" discovered in the work by a critic, are not perhaps so certain to be in truth omissions. Mention has been made, by a critic, of an *Infant Johnson* now at Bowood. But is that picture admitted without contest to be the work of Sir Joshua? At the first blush, at least, it does not look very likely. Mr. Watts, at all events, has painted no portrait of the "infant Tennyson" or the "infant Browning." Sir Joshua lived in other times, and may therefore have done otherwise. The point is worth settling, and meanwhile the author of this *Catalogue Raisonné* may no doubt be congratulated on having accomplished a work which contains much that is interesting.

FREDERICK WEDMORE.

History of the Coinage of Syracuse. By Barclay V. Head. (London, 1874.) A little volume with fifteen plates, giving 192 selected specimens of the coinage of Syracuse, reproduced in the best manner of the Autotype Company, must be a great temptation to those who know just a little of that most splendid series of ancient coins. A wide circulation of Mr. Head's book could be only for the interest of public instruction and delight. The text is, of course, very learned—it had originally appeared in the *Chronicle* of the Numismatic Society of London—dealing often with such subjects as standards of weight, and the fluctuations in the relative value of metals. At the same time there are few pages which do not bear witness to that desire of imparting generally useful information so conspicuous in Mr. Head's *Guide to the Electrotypes of Coins exhibited in the British Museum*. Though in theory the principle of selection which Mr. Head has followed is not that which obtains in nature, and is now very frequently met with in the publication of works of art, viz., a selection of the most attractive specimens—practically he has nearly arrived at the same result. The primary object of the book is to give a chronological view of the coins of Syracuse, of which town a brief historical outline is given, divided into periods and placed *vis-à-vis* with the periods of coinage. There is an awkward sentence on p. 2, in which certain coins are spoken of as "described by themselves," and again at p. 25 the printer has been at fault in the following sentence: "But how they were sold, or how much of the territory was sold, we are left in ignorance."

THE *Monthly Magazine of Design* consists of forty-four designs illustrative of the master-pieces of all periods. The work is in folio, with bold, well-executed woodcuts, much in the style of the *Art pour Tous*, published in Paris. The subjects are mostly derived from German museums, many of great interest. One of the most curious is a ceremonial hammer, preserved at Munich, used by Pope Julius III. when he opened the Jubilee of 1550, by giving three strokes upon the door of St. Peter's. Pope Gregory XIII. used the hammer on a similar occasion in 1575, and then gave it to Duke Ernest of Bavaria, who had been present at the ceremony. The hammer is of silver, gilt, richly decorated with the Papal arms, a relief of Moses striking the rock, and various figures and ornaments. A plate is given of the fine sword-hilt of Duke Christian I., from Dresden, chased with figures in high relief and exquisite finish, the work of Leigeber, the armourer, of Augsburg. A gold necklace of four small interlaced chains with central knot and serpent ends, and a diadem with acorn filagree pendants, both from the graves near Kertch; four elaborate plates of a monumental

stove of German faience in the Castle of Wülflingen, near Winterthur, similar in style to that by Hans Kraut in the South Kensington Museum; the fine carvings in the Minster at Constance, a gorgeous carved table pedestal at Stuttgart, a mirror frame at Vienna—are among the illustrations of this book, which, if it continues of equal merit with this first volume, will be a useful addition to the many illustrated works on Art-workmanship.

EDITOR.

THE CHURCH OF THE SACRED HEART ON MONTMARTRE.

THE history of the Church of the Sacred Heart, or the votive offering of the nation to be erected on the heights of Montmartre, is intimately connected with our political history during the last few years. The designs for its construction, which have been for some weeks exhibited for competition in the Palace of Industry, show plainly that more than one of the architects have endeavoured to embody the idea of the clergy, which was inspired by resentment and ambition. The object of the designers in these plans, therefore, is twofold—to exhibit their architectural ability and, at the same time, declare their principles.

The intention of erecting some religious building to dominate over Paris and proclaim France to be repentant and devout (*Gallia poenitens et devota*), has for a long time been nourished in the minds of the heads of the Church. It was first realised in the Church of Sainte-Geneviève, but that was a much more modest attempt than the present. Paris could hardly object to the honour bestowed upon her patroness, a shepherdess and daughter of the people, a kind of peaceful Joan of Arc, who had saved her country from the attacks of the Huns. This huge pill was gilded with romance; and, in accordance with the devotion paid by the French to the ugliest foreign objects, its form bore a certain vague resemblance in miniature to St. Peter's at Rome. But the Revolution possessed herself of this basilica, which has nothing Christian or Catholic either in its external form or in its interior decorations. The Revolution dispersed to the winds the relics of problematic authenticity, and removed thither, as to their last resting-place, the bones of Rousseau and Voltaire. On the façade, which resembles that of a pagan temple, she inscribed this dedication: "Aux grands hommes la patrie reconnaissante." None of the reactions which have followed have been able to purify the Pantheon from the poisonous breath of the Revolution. The shades of Voltaire and Rousseau fill the dome. M. Philippe de Chennevières is endeavouring at the present moment to disguise the interior with religious paintings, but this attempt will last no longer than the clerical carnival. When that is over the mask will fall of itself. The Assembly authorised the building of the Church of the Sacred Heart soon after the triumph of the cause of order. The middle classes, forgetting that they were, and always must be, essentially Voltairian, voted for it at a sitting which must have greatly astonished the rest of Europe. The Pope sent two briefs and 20,000 francs to the Archbishop of Paris. The proclamations set forth that the nation, in furtherance of its vow to obtain the deliverance of the Sovereign Pontiff and the salvation of France, propose to erect a votive church to Jesus Christ and his Sacred Heart in the name of France. By order of the Archbishop a subscription is to remain open for five years in the diocese of Paris. Collections are to be made in all directions for the sacred purpose. The subscription is said to amount already to 1,500,000 francs. We shall see presently that this will not go far. But, rightly or wrongly, the Parisians are persuaded that this subscription is entirely political, and that the larger portion of the funds is intended to help the Spanish priests to shoot those who have not the same views on the Republic as they have themselves. The

papers distributed in the beginning of this year to the competitors announce that the new building, whose aspect is to be north and south, is to have its façade and principal entrance looking towards Paris. Several of the architects, with this end in view, have surrounded this façade with a wide gallery whence an imposing group of ecclesiastics may, on solemn occasions, distribute their benedictions over the town, which will be, as it were, kneeling at their feet. "Bless, bless, my lord," said a priest to a bishop who, during the Empire, was somewhat unpopular in his diocese, "Bless, God will know his own." A colossal statue of the Sacred Heart is to be placed on the exterior in a conspicuous position. Some of the competitors, taking these words literally, have made the whole edifice a sort of huge pedestal to a statue of Christ exhibiting through his side a bleeding heart; some have placed this statue, perfectly isolated, on the top of the central tower or on the dome, a familiar and not too respectful mode of treatment; others have enclosed it within a canopy supported by small columns or have imitated the charming fountain of the Innocents (which, by the bye, in its primitive condition had only three sides, as it rested against a wall). One competitor loyally royalist, has made the three columns of the central tower support a royal crown. The Comte de Chambord will, no doubt, graciously thank him from Frohsdorff, and—like M^{me}. de Sevigné, who declared Louis XIV. to be the wittiest of men one day when he asked her to dance—will pronounce the plan of this architect to be the most perfect of all.

The Pope will also have to thank M. Moyaux, who has surmounted his edifice with a tiara—the triple crown which rules over all the powers of earth. I am afraid that Paris will find some difficulty in bowing down before this new cap of Gessler. The clergy must have thought itself very powerful when it ventured on such impertinences. Is it really so strong; or must we utter the terrible prediction of the poet, *Quem deus vult perdere prius dementat*? The building is to be crowned with one or more high towers, domes, or belfrys. There is a rivalry between two parties, one in favour of domes, who have the Institute on their side, the other in favour of belfrys, protected by the clergy. The Institute supports M. Abadie, inspector-general of diocesan edifices, architect and restorer of the celebrated Romanesque church of Périgueux. His plan includes, besides a central dome and a number of little domes, decreasing in size, a high, square bell-tower, placed at one of the angles of the end opposite to the façade. The party of the belfrys is, they say, secretly favoured by the Archbishop himself. They patronise two brothers, by name Douillard. One is a layman, the other, who obtained the second artistic prize in Rome, became disgusted with civil life and took orders. He is, I believe, a Dominican. The design of the brothers Douillard does not impress me in the least. And who can foretell what mines will be sprung? The archbishop, in order to make concessions to the ideas of the day, or at any rate to the promoters of ideas, has appointed a commission to decide between the works offered by the competitors, twelve members of which will be appointed by himself and six by the competitors. The designs will be classed; the ten first on the list will receive compensation to the amount of 12,000 or 15,000 francs. This is quite right. But His Eminence, in a wise and prudent clause, formally reserves to himself the right of selecting the architect entrusted with the building, either from among the competitors or elsewhere. [We recorded last week that the first prize in this competition had been awarded to M. Abadie.—Ed.]

The whole expense is not to exceed seven million francs. It is a regular mystification. The requirements are considerable—a church, a crypt, buildings for the sextons and for the sacred vessels, apartments for the resident and non-resident priests, a kitchen with its acces-

sories, and a cellar—additions essential to a clerical establishment according to the paper of instructions. All this would require more than seven million francs, but they must also remember that they have to build upon a soil as thin as cardboard. Wells have been sunk and soundings taken. Stone was reached only at an enormous depth. Montmartre has emptied itself in the construction of Paris. The development of the city in the vast basin watered by the Seine has had for its primary and permanent reason the abundance of stone and other materials, and the facility with which they could be made use of. Montmartre is as hollow as a cocoa-nutshell. The hill ought itself to be rebuilt before it could support an edifice of such size.

But let us proceed. Two plans are really fine. One of them is practical. It is by Messrs. Magne—father and son. M. Magne, the father—an architect of great merit, to whom we owe the charming Vaudeville Theatre which ornaments the corner of the Boulevard and the street of the Chaussée d'Antin—sent an admirable plan to the competitive exhibition for the rebuilding of the Hôtel de Ville. The intrigues of the Institute carried the day against all justice: against the expression of public opinion M. Magne was passed over. He now sends a church in the style of the French Renaissance, resembling in some respects St. Eustache. Two towers flank the façade. A wide gallery surrounds the interior. The porch is reached by steps, with stations on which the pilgrims may rest, and in the middle a vast Calvary. Without entering into a technical discussion of the design, we may say that its decorative effect would be elegant, substantial, and according to the traditions of the French national school.

M. Pascal, a student of the college in Rome, is inspired by the Florentine school. His church, crowned by an enormous dome, is supported on a heavy, thick, blind lower storey like the proud, solid edifices of the Italian Renaissance. It is an emanation of a triumphant and militant Papacy. One looks for the muzzles of crossbows in the rare apertures of the walls. The buildings intended for the sexton affect the severity of a barrack. This church would not sprinkle a refractory and unbelieving town with holy water, but with grape-shot. From a purely artistic point of view this plan has a certain wild and uncompromising grandeur.

I will say no more. These plans as a whole (among them are many due to English, American, and Spanish contributors, for all Christendom was summoned to the task) reveal the fact that the religious architecture of the present day lives on expedients, not on realities, in communion with the ancient, not at all with the modern spirit. The Catholic Church—whether called Roman or Gallican matters little; it is the same Church—is committing an unpardonable blunder by trying to establish on the highest point of a free-thinking town a monument of defiance—it is thus that quarrels are perpetuated.

On leaving this exhibition, which neither pleases the eye nor interests the mind, I climbed the heights of Montmartre which it is proposed to mask in this manner. What an admirable position for a memorial of an original description. A democratic Government might here realise a splendid and delightful idea. The air is so fresh and bright, the horizon so clear, the town, which extends as far as the eye can reach, looks so grand and peaceful, like a grey-coloured flock of sheep in repose. None but tranquil thoughts of justice and intellectual enjoyments can find place in the mind of the beholder. I can imagine these heights laid out in large gardens; rapid waterfalls might issue from the rocks, forming brawling cascades in summer and sparkling icicles in winter. All the occupations which require silence might here be followed under the blue vaults of the heavens in quiet dreamy walks. Here might be established museums, libraries,

observatories, laboratories, all on a large, grand, practical scale, worthy of the reception of scholars from all parts of the world. There would also be room—the space is so great, and the ascents might be utilised—for a thousand manly and healthy sports for the young, who ought early to be taught to love elevated situations. Council-chambers and concert-rooms might be added for the accommodation of the orators and artists passing through Paris. Lastly, as poetry is the fire which, eternally burning, illuminates, and at the same time consumes, mankind, there might be a large casino at the disposal of poets and literary men, of all whose society elevates their fellow-creatures, from all parts of the world. Victor Hugo might receive Swinburne in these halls, and Michelet might have welcomed Garibaldi in the name of France, as the English aristocracy saluted him in the name of England. These are plans, not dreams. They would be more interesting, and to more people, than this church, which has been satirically called, after a well-known windmill, “Notre Dame de la Galette” (Our Lady of Cakes).

My bad handwriting has caused the mis-spelling of an honourable name in one of my last letters. It should be Emile Trélat, and not Emile Violar.

The prize for the plans of the House of Correction has been awarded. I do not wish to excite ill-feeling, either with respect to the judges or to the competitors who received compensation, but many complaints are made. It is generally considered that the manner of electing the jury throws much too much influence into the hands of the Institute, who favoured their own students and protégés.

PH. BURTY.

NOTES AND NEWS.

We have seen this week the print from Turner's plate of *Dumbarton*, which Mrs. Noseda has just published, at her shop in the Strand. It need hardly be said that it is a work of high interest to all who care at all about the Turner prints. How it comes to be “just published,” it may be well to explain in two words to those who are not familiar with the history of *Liber Studiorum*. The publication of *Liber* was arrested in 1819, when the seventy-first print had been issued, but some ten or twelve other plates had already been prepared, and as the series, though of the highest artistic value, was never during Turner's life a commercial success, these last plates remained unused. Here and there a very rare proof was to be found, but nothing else. This plate of *Dumbarton* was long in the hands of Thomas Lupton, its mezzotint engraver, and it was sold at his sale last spring. Some impressions, besides those early proofs of it printed in Turner's lifetime, have now been taken of it, and it is one of these—their number is quite limited—which we have this week seen. *Dumbarton* is one of the more complicated among the *Liber* subjects. It is rather rare for Turner, when aiming chiefly at an effect of distance and space, to give so much thought, and such beauty and effect, to the immediate foreground. Here the distribution of light and shade is of marvellous felicity, and the composition shows Turner at his best. Dark, heavy foliage in the foreground, and then the lighter leafage of acacia, and then the beginning of the wide valley, with field beyond field, and a still river, and in the distance a low chain of hills—the effect is delightful. It may be of some interest to add that at one time it was asserted that the plate itself was not produced during Turner's lifetime, and accordingly that the etching—the etched outline, which, as well as the sepia drawing, is always Turner's work in *Liber*—was not, in this one case, the work of his hand. But this mistake has long ago been corrected, we believe; so that Mrs. Noseda might fairly have used the common description, “drawn and etched by J. M. W. Turner: engraved by Thomas Lupton.” The etching is singled out for special praise, as

Turner's work, in Mr. Hamerton's big book, *Etchers and Etching*; and moreover, a freely touched proof, exhibited by Mr. Bale at the Burlington Fine Arts Club two years ago, can leave no doubt that Lupton's mezzotint work in the engraving was executed under the painter's immediate supervision. The print, as we have said before, is one of interest and beauty.

THE *Pall Mall Gazette*, in an occasional note upon the impending fall of Temple Bar, falls into a strange mistake with reference to its history in stating that the last heads that adorned the gateway were those of Fletcher and Townley, and that these fell down in 1672. It so happens that that was the very year in which Temple Bar was finished, and every one remembers how Goldsmith, a hundred years later, drew Johnson's attention to its ghastly decorations, and allily whispered:—

“Forsitan et nostrum nomen miscelbitur istis.”

Much as we may regret the removal of the last of the City Gates it must be admitted that the structure itself is scarcely worthy of its architect's reputation. We might perhaps have fared better if the petition of Sir Balthazar Gerbier had been granted, and he had been permitted (in 1664) to carry out his plan “concerning the cleaning of the streets, the levelling the valley at Fleet Bridge with Fleet Street and Cheapside, and the making of a sumptuous gate at Temple Barr.” Though Sir Balthazar was, as Walpole says, a quack as well as an architect, his scheme for rebuilding London had some conspicuous merits, and he might have proved the Hausmann of the seventeenth century, as he made convenience one of the tests of good architecture.

MR. C. G. CONSTABLE writes to the *Times* to suggest that some means should be devised of excluding spurious works from future art exhibitions. He complains that sixteen pictures are wrongly attributed to his father, John Constable, R.A., in the catalogue of the pictures at the present International Exhibition. These “shams” are as follows:—

42. “*The Embarcation of George IV. from Whitehall on the Occasion of his opening Waterloo Bridge*”; 52, *Effect of a Passing Shower*; 55, *River Scene*; 59, *Young Waltonians*; 91, *Hartlepool*; 92, *Dedham*; 96, *View of Birkenhead*; 107, *The Chimney-piece in the Council Chamber of the Palais de Justice at Bruges*; 134, *The Horse Farm*; 160, *Landscape*; 172, *The Water Mill*; 176, *The Valley of Stour*; 185, *Brighton Beach*; 190, *A Dell in Helmingham Park*; 194, *Landscape, with Church*; 207, *Landscape, with Church*.

THE completion of the Museum buildings at South Kensington has at last been determined upon. The question was considered a few years ago by the late Government, but the designs then prepared were thought too costly, and nothing was done towards carrying them out, or finishing the buildings in a less expensive style. At a meeting held a short time since, presided over by the Duke of Richmond, the idea of a cheaper building was given up as unfitting, and General Scott was directed to design a structure that should be in every way worthy of the use to which it would be put.

THOMAS MORAN, an American artist who has acquired considerable fame in his own country, although his name is but little known in this, is now exhibiting at New York an enormous painting representing *The Chasm of Colorado*. If size and boldness of subject in a painting make greatness, then this picture, according to the descriptions of it, must indeed be great. Mountains hundreds, nay, thousands of feet in height, yawning precipices and passes that make one giddy, fill the canvas, while in contrast to the more solemn features of the scene, a pretty rainbow bridges the frightful chasm. American critics are not unanimous in their admiration of this great work of art, many considering that the artist has failed entirely to convey the impression of the awful majesty of the subject he has attempted to grapple

with. Nature in some of her aspects beats even an American artist, armed with a mile of canvas for her conquest. A former picture by Thomas Moran, *A View on the Yellowstone River*, was bought by the Government.

Another American landscape, of a totally different character from *The Chasm of Colorado*, is exhibiting with it. The painter is B. C. Koekkoek, and his simple rendering of a country scene forms a striking contrast to the ambitious attempt of Moran.

THE Archaeological Congress at Stockholm opened yesterday. Its programme is as follows:—Friday, August 7, Opening Meeting. Saturday, August 8, 1. Discussion of the question, What are the oldest traces of the presence of man in Sweden? 2. How was the trade in amber carried on in ancient times? On Sunday the Congress will visit the Museums. Monday, August 10, 1. How are Swedish relics of the Stone Age especially recognisable? 2. Open discussion. Tuesday, the 11th, will be occupied with a visit to Old Upsala. Wednesday, the 12th, 1. How are Swedish relics of the Bronze Age especially recognisable? 2. Open discussion. On Thursday, the 13th, the Congress will visit the antiquities on Björkö and Gripsholm. Friday, the 14th, 1. How are Swedish relics of the Iron Age especially recognisable? 2. In what relation do they stand to the relics of the preceding Ages, and to the peoples of southern Europe? Saturday, the 15th, What were the anatomical and ethnological peculiarities of the prehistoric inhabitants of Sweden? On Sunday, the 16th, the Congress will close.

In a somewhat elaborate article in *Le Temps* of August 3, M. Charles Blanc makes the *éloge* of Flameng's large and remarkable etching from Rembrandt's famous picture at Amsterdam, *La Ronde de Nuit*. He remarks, of course, that it is only since the revival of etching that it has been possible to render at all adequately the freedom and mystery of this work. Thus far only proof impressions have been taken off, and M. Blanc advises M. Flameng to give to his plate a little more distance—to make his work, indeed, a little less definite and clear. For many of the fine qualities of etching it is certainly noteworthy; nor is this to be wondered at when it is remembered that it is as a copyist of many of Rembrandt's works—some paintings, and some etchings themselves—that M. Flameng has won fame.

THE Fine Art Exhibition at Rouen does not seem to have much to recommend it. According to French critics, it falls below even the usual mediocrity of provincial exhibitions. The works by Norman artists are neither numerous nor remarkable in any respect, while those by Parisians are for the most part second and third rate productions. The sale of works of art at these exhibitions is not sufficiently good to tempt artists of merit to send their works, and the encouragements held forth by the committees in the shape of awards, &c., fail to attract even native artists who have a chance of being seen in Paris. The director of the Rouen Museum himself, M. Gustave Morin, only exhibits one little picture, *Le Retour du Tournai*.

THE Brussels Museum has received a considerable addition by the gift of Herr van Ravestein, who has presented to it his splendid collection of antiquities made during a long residence in Rome at the time when he was the Belgian ambassador. The collection is to be kept together under the name of the Ravestein Museum.

M. DE LONGPÉRIER, at a recent meeting of the Academy of Inscriptions, read a letter from M. Antoine de Villefosse, announcing his recent discovery at Carthage of two terra cotta masks, which are painted in red, with the hair and eyebrows black. The ears are pierced in six places, apparently for earrings; but these holes must not

be confounded with seven much larger holes round the masks, which served to fasten them to the face. M. de Villefosse considered these objects to be funeral masks, and not the images of a Carthaginian god. The height is 19 of a mètre, and the extreme width 13. M. de Longpérier then exhibited photographs of other red masks, discovered in Egypt and various parts of Asia, and pointed out the great resemblance between them and the Carthaginian masks. He was inclined to think that they are images of Carthaginian gods, as they are not large enough to fit the average human face; and he recognised in them all the characteristics of Phœnician art of high antiquity. This is the first discovery of the kind; and is of great importance as giving us an idea of Carthaginian art in the most remote times.

THE Belgian painter, Hippolite Boulanger, died recently at Brussels at the age of thirty-six. His *Allée des Charmes*, exhibited at the Brussels Academy in 1872, and his *Roches de Falmagne*, are among the best of his pictures, and together with his *Printemps* gave promise of his taking his place amongst the best landscape painters of Belgium.

THE King of Portugal has given a commission to M. Lazraud, a French artist who has been for some time resident in Lisbon, to paint the portraits of himself, his queen and their children in one large family group.

THE magnificent Abbey of Mont St. Michel on the coast of Normandy has been recently declared to be a "national monument" by the French Government, as well as the Druidical remains at Carnac before mentioned in the ACADEMY. Its preservation and, if necessary, its restoration will be by this means, it is to be hoped, effectually ensured.

THE rebuilding of the Munich Academy is quite decided upon. The Bavarian Chamber of Deputies has lately voted a sum of 500,000 gulden as a first grant towards it. The Diet of the Rhine Provinces has also voted a yearly grant of 4,000 thalers for the foundation of provincial museums in Bonn and Trier.

THE art critic of the *Kölnische Zeitung* writes as follows concerning Ferdinand Keller's picture of Nero at the burning of Rome:—

"It is a great picture, very significant in its colouring, a product of the new direction in art, which has found in Makart its most remarkable if not its first representative. It has not all the excellences that we find in Makart's works, and it has some faults in common with these, but not all. It excels Makart in its realism, solid drawing and modelling, but it has not the genial effect produced by new and striking combinations of colour that distinguishes his pictures. In common with them, on the other hand, there is a fulness of purely ornamental accessories, and, though perhaps not in equal degree, a disregard of realistic probability in the representation. As an historic scene, the picture of Nero is not very comprehensible."

If we are to believe the reports of wandering art-critics, neither Germany nor Italy has much cause to boast of its most recent efforts at what we may term national commemorative figure-statuary, and after reading the accounts that come direct to us from the feet of Hans Sachs at Nürnberg and Petrarch at Padua, we feel that the time for throwing stones at our Wellington is gone for ever. Surely German art might have found some more characteristic conception of the genial mediæval cobbler-poet than to put a mantle over his shoulders, a sheepskin at his side, a roll of paper in one of his hands, a pencil in the other, and folios in ponderous chaos around him! Hans was neither knight, shepherd, nor book-worm, but a genuine poet of nature and a keen satirist of human folly, and all that can be said in favour of this most recent of German memorial statues is that the face expresses something of the homely mother-wit, good-humoured sarcasm and ideality, that combined to make the man what he was,

which the rest of the figure, with its meaningless accessories, totally fails to reproduce.

THE statue of Petrarch, which was unveiled at the recent festival on the Piazza S. Maria del Carmine at Padua, is the work of Professor Ceconi, and exhibits the immortal poet of *Le Rime* with a youthful, almost girlish face, to which, however, a look of concentrated anger is imparted, and which is evidently intended, like the clenched left hand, and the Ode to Italy held in the right hand, to convey the state of patriotic enthusiasm felt by the Italian citizen when he reflected on the hapless condition of his beloved Italy, but yet felt constrained to proclaim that

"Negli Italici cor non è ancor morto."

This is, however, scarcely the sentiment with which the world at large will associate its deepest memories of the poet; and it seems a pity that a genius which speaks to all men should have been made to address himself so exclusively to the patriot and the politician. It is worthy of record that the two best poems recited at the Petrarch Commemoration were by ladies, the one being by the Countess Mahul, who, amid the tears of the audience, read her own French translation of some of Petrarch's odes, whilst the Signora Erminia Fria Fralinato, a young Italian poetess, who had been officially appointed to represent the Municipality of Rome, gained tumultuous applause by her delivery of the sonnet which she had composed in honour of the occasion.

THE American papers likewise are greatly exercised by the bad statuary which is from time to time executed at the expense of the State to honour the memories and caricature the features of those who have done her good service. Apropos of the latest job, the *Nation* remarks:—

"Mr. Sumner, who had a taste for art—the taste, perhaps, of a collector rather than of a person endowed with true taste—plainly told the Senate, when Miss Vinnie Ream wanted a commission to make a statue of Lincoln, that senators might as well place Miss Ream on the staff of General Grant; or put General Grant aside and set her on horseback instead. 'She cannot do it,' he said, 'she might as well contract to furnish an epic poem or the draft of a bankrupt bill.' But many of the senators represented constituencies such as the Western one which a year ago was admiring a fancy bust sculptured in lard or butter by a lady who exhibited it at a State fair. It was beautifully done, according to the accounts. Others were from a part of the Union where, some years since, a young artist, Mr. L. G. Mead, did a statue or statues in snow, to the admiration of all beholders. And the question as to skilful hands like these and many more (which actually can make a figure exactly like a human figure, and one which actually looks like So-and-so) whether, that is, they have behind them any of the qualities which make of a man an artist as distinguished from a practitioner of elegant stone-cutting and a statue-maker for 'M. or N.' as the catechism says, is a question which few if any legislators, and few other persons, ask themselves. Indeed, there is no reason why they should. They do not know that the question exists. Mr. Sumner spoke in vain, and Miss Ream got her commission, and her Lincoln is now among the monuments of the Capital. It is understood that the same woman has succeeded in getting the commission for the colossal Farragut statue, and this although her design was rejected by the proper Congressional committee; she afterwards secured her contract by the vote of a board of commissioners, of whom a majority were committed in advance to vote for Miss Ream."

THE STAGE.

MR. BENJAMIN WEBSTER's melodrama *Janet Pride* (in which Mme. Celeste used to be distinguished) was reproduced at the Princess's Theatre on Saturday evening, with Mr. Webster himself in his original part. He is ably supported by Mrs. Mellon in the rôle that was Mme. Celeste's, but which Mrs. Mellon does not now play for the first time, and also by Mr. Belmore, and his own performance continues to be an

elaborate one. The veteran actor, it may be remarked in passing, will very shortly retire finally from the stage. He purposes making a last provincial tour before doing so. *Janet Pride*, though already in some respects old-fashioned, is quite the kind of piece to draw a summer audience and middle-class visitors to London, to the Princess's Theatre, where, we understand, it will continue to be performed for the next week or two.

THERE was a brilliant house at the Haymarket on Monday night, when Mr. Buckstone took his annual Benefit and bade farewell to his patrons and friends until his return in October. The Duke of Connaught occupied the royal box, and the theatre was densely crowded. What is chiefly looked forward to on these occasions, which are among the great events of the theatrical year, is the speech of Mr. Buckstone, which is always more funny to hear than to read, as indeed a comedian's speech ought to be. Mr. Buckstone was very jovial over the unsuccessful pieces of the season, and he gave his audience a little information about his plans for the autumn. These include the return of Mr. Sothorn, and the repetition of the comedy, *A Madcap Prince*, which was produced on the night of the Benefit. Monday evening was made additionally agreeable through the extreme good nature of Mr. Sims Reeves, who as his tribute to the manager of the Haymarket, sang first Blumenthal's pathetic song, *The Requit*; next, a new sailor-song by Molloy, and lastly, in response to a loud call for it, the ever-green *Tom Bowling*. Mr. Reeves was in excellent voice, and sang with great feeling and dramatic expression. Between his first two songs, which were the only songs he was announced in the programme to sing, there was acted a comedieta, or little one act comedy or *proverbe*, by Mr. Theire Smith, which had previously been played, but not at the Haymarket. It is called *A Happy Pair*, and it is exceedingly French, not in subject, but in treatment. It is witty, and if its wit claims to be original, then it is undoubtedly a piece of writing which we have cause to be thankful for; for it sparkles very much, and is fruitful in opportunities for the exercise of Mr. and Mrs. Kendal's best art. For private theatricals, played by intelligent people, it would be invaluable. Mr. and Mrs. Kendal do the fullest justice to its good points, and make many excellent points to boot, for which the piece gives scope, but which are not precisely on the surface of the dialogue. Mr. and Mrs. Kendal have never been seen to greater advantage than in *A Happy Pair*.

A Madcap Prince, by Mr. Robert Buchanan, is a comedy of some pretensions. The scene is laid in a large house in the country, in 1652, immediately after the Battle of Worcester. The nominal hero is the Prince, who was afterwards Charles the Second, but the actual "Madcap Prince" is not so much Charles the Second himself as the heroine of the play who assumes his disguise, who is kept under surveillance as the Prince while the real Prince is taking ship, and who, both to keep up the delusion and to make her own lover jealous, adopts along with his disguise, the manners of the prince when in the company of women. The intrigue, though a slight one, is ingeniously worked, and the audience on Monday night relished it very much, when it had the advantage of Mrs. Kendal's most spirited acting; but much of the amusement is caused by the behaviour of the supposed boy prince in making love to the various women with whom he or she comes into contact, and though these happen to be the kinswomen and friends of Mistress Elinor Vane, the heroine, it may be questioned whether the idea is altogether a pleasant one. Apart from pleasantness, it is possible that it may not be of sufficient strength and importance to build a three-act comedy upon. There is nothing very brilliant in the dialogue, and the characters are not particularly distinct, though Elinor Vane herself is highly coloured. This part affords opportunities for the display of several

phases of an actress's talent. It is best in the earlier scenes, before the disguise is assumed, and when the heroine is endeavouring to dissuade the Puritans from the search for the Prince, and when she is assuming their own tone and twang and when she suddenly breaks from this—carried away by strong feeling and decided opinions. These are opportunities of which Mrs. Kendal makes the most. She does more—she improves upon them. Still the author himself, in these early scenes, has evinced considerable perception of the possibilities of dramatic effect. The piece of acting which goes down the most with an audience on a Benefit night, inclined to be hilarious, is the scene of flirtation and cajolery with more women than one, which occupies much of the third act; but the best piece of acting is in the second act, where, as Elinor Vane, Mrs. Kendal quiets the suspicions of one who would search behind the wainscotes, and where, in a moment of dismay, she would gladly recall the dangerous opinions she has been surprised into expressing. Mr. Kendal's part, of a not unnaturally jealous lover, is not a fine or varied one, but it is excellently played. The best thing about Mr. Buckstone's part is probably its name, "Light o' the Land Sawdon"—he is a private soldier whose ambition it has been to keep a modest tavern where only the pious may drink. His share in conversation appears to be nearly confined to the utterance of "yea, verily"—an observation the humour of which is not at first apparent. The comedy will be again represented in October next, when the Haymarket reopens, and at that time it may possibly be desirable to treat it at greater length in the ACADEMY.

MR. PIGOTT is appointed Examiner of Plays. He is known to many as a brilliant journalist.

MISS FURTADO is acting at the Londesborough Theatre, Scarborough.

MR. BUCKSTONE and the Haymarket company, will appear at Liverpool next week.

MDME. CHAUMONT has been acting at Caunterets, in the Pyrenees.

THE first rehearsals of Voltaire's *Zaïre*, at the Théâtre Français, were announced in this journal three months ago. They have proceeded until lately very slowly, owing to the length of time that the young tragedian Mounet-Sully occupies to learn a rôle. But it is said that the recent good success of M. Dupont Vernon, a *débutant* at the Français, has stimulated the energy of M. Mounet-Sully; and that there is now a prospect that the play will be produced during the lifetime of his brother actors.

OFFENBACH is getting a hearing again in London, for *The Grand Duchess* is now nightly performed at the Lyceum.

THE Gymnase Theatre, which has not been doing wonders lately, changes its programme altogether in the course of a few days. There will be a revival of *Héloïse Parquet* and also of Scribe's *Malheurs d'un amant heureux*, it is said. The proposed cast of the latter play seems a fairly good one. Landrol, an excellent actor, is included in it. *Héloïse Parquet* was interpreted, on its production, by Mdme. Pasca, Mdle. Delaporte, M. Nertann and others. Mdme. Fromentin will replace Pasca; Mdle. Déla will assume the part originally played by Mdle. Delaporte; and Pujol will be in the place of Nertann.

THE annual contests for prizes in acting tragedy and comedy, took place last week at the Paris Conservatoire. Neither any first nor any second prize was adjudged to the young actors in tragedy. Two second prizes were awarded for comedy-acting. Of these, one was given to Mdle. Samary, who is a niece of the Brohans. She played Toinette's best scene in the *Malade Imaginaire*, and M. Sarcey is content that she has received the prize. But an equal prize given to Mdle. Réjane he regards as a mistake,

because the young lady will probably go with it to the Odéon, now, he says, a bad school for clever players. She ought to go to the Gymnase or the Vaudeville, he adds. These would teach her her art—comedy—and see what she could make of it. There is a Mdle. Volsy at the Conservatoire, who was expected to win a first prize, but did not. She is nevertheless destined, in the opinion of M. Sarcey, to be one of the dramatic artists of the future. It should be said, in qualification of his judgment, that she is remarkably handsome. A young man named Carré and a young man named Matrot, also received prizes.

APPROPOS of voting the theatrical subventions, in the Assembly at Versailles, there was a discussion, in the course of which M. de Tillancourt pointed out the advantage that must accrue from the establishment of regular performances at the Conservatoire, so that the pupils might early familiarise themselves with the presence of a public. The public would be small and chosen. So much the better. He pointed out the evils resulting from the present frequent practice of going out to some suburban or poor provincial theatre, to gain the actual experience which the Conservatoire should afford. At these inferior theatres, pupils of talent are associated with actors generally of little merit, and play before a rough public, which can only deteriorate their taste. M. de Tillancourt was not correct in adding that without some such practice it is impossible to procure engagements; for trial engagements are offered by the Théâtre Français to pupils straight from the Conservatoire, and it is understood to be the opinion of those who manage things in the House of Molière that a pupil straight from the Conservatoire will promise more than a pupil who has acted a good deal, even though it be only for practice, upon the boards of the very inferior theatres to which access is most easily obtained.

MUSIC.

NEW CHAMBER MUSIC.

Octett, für Vier Violinen, Zwei Bratschen und Zwei Violoncelle. Von Joachim Raff. Op. 176. (Leipzig und Weimar: Robert Seitz.)

Sextett, für Zwei Violinen, Zwei Bratschen, und Zwei Violoncelle. Von Joachim Raff. Op. 178. (Leipzig und Weimar: Robert Seitz.)

Zwei Quartette, für Zwei Violinen, Bratsche, und Violoncell. Von Johannes Brahms. Op. 51. (Berlin: N. Simrock.)

Quartett, für Pianoforte, Violine, Bratsche, und Violoncell. Von Josef Rheinberger. Op. 38. (Leipzig: E. W. Fritzsche.)

It is to the musical student most interesting to watch the various developments of artistic thought as they are to be seen in the most recent publications of some of the chief living composers. We find musicians from time to time trying experiments, and making innovations with more or less success; but, on the whole, it must be said that as regards the forms at least of instrumental music little improvement has been made on the old models left as a precious legacy to musicians by Haydn, Mozart, and Beethoven. It is very curious and instructive, and speaks not a little for the vitality of these old forms, to find so distinguished and talented a composer as Joachim Raff, who has probably tried as many experiments as most musicians, and who, like the preacher of old, has set himself to seek out all wisdom and knowledge, returning in the period of his fullest maturity more and more into the trodden paths, and, as if conclusively to prove that these are the

safest and best, producing works, so far as we are able to judge, far superior to most of his earlier compositions. We insert this saving clause, because Raff's published works number over 180, and it is doubtful whether anyone can speak of them in their entirety. A comparison, however, of some of the more important of his earlier pieces with his more recent ones is decidedly to the advantage of the latter. In his first trios, sonatas, &c., there is side by side with remarkable talent great diffuseness—the besetting sin, as has often been remarked, of the new German school. In the octett and sextett now before us, no trace of this fault is observable. True the movements are extended to considerable length; but this is justified by the amount of subject-matter. Both works are overflowing with ideas; and the variety is such as to prevent any feeling of undue prolixity.

It is not intended in the above remarks to imply that the utmost limits of artistic possibilities have been reached by Beethoven. There can be no such thing as absolute finality in art; it is ever progressing, and it is quite conceivable that hereafter some new form may be discovered which shall supersede the "sonata" form, just as this has itself replaced, or (to speak more accurately) enlarged and developed, the older types of instrumental music as found in the works of Bach and Scarlatti. All that is said here is that this is as yet among the possibilities of the future rather than the actualities of the present; the proof being that it is precisely those works in which the old models are most closely followed which produce on the reader and hearer the most satisfactory impression.

Raff's octett, which is in the key of C major, is a case in point. While full of originality both of invention and treatment, it is constructed entirely upon the recognised model. The first movement opens with a broad phrase in unison for violas and violoncellos, which is repeated subsequently by the whole mass of strings. An abrupt but striking modulation into E flat (p. 6) leads shortly after to the second subject, which, according to rule, is in the key of G. Vigour and energy are the chief characteristics of this movement, while the workmanship, especially as regards the contrapuntal treatment of the themes, is most masterly. The scherzo in C minor which follows has a strong flavour of Beethoven about it; without anything like plagiarism being apparent, it is impossible not to perceive the influence of the older master. In the very charming andante (in F), which forms the third movement, the treatment of the instruments is particularly happy. It is a kind of familiar conversation, in which each player has his word. The finale is full of bustle and life, and quite equal to the first movement in the science displayed in its developments. There is comparatively little real eight-part writing in the work; but Raff produces in many places an effect of great richness and fullness by writing a four-part harmony, and then with the other strings doubling each part in the octave below. The beauty of the ideas, and the sustained interest of the treatment of the whole work, renders it one of its author's best compositions; and it well deserves to be brought to a hearing in this country.

Hardly less excellent, though entirely different in style, is the same composer's sextett in G minor. The first movement, of a pathetic, almost elegiac tenderness, is remarkable for its melodic beauty. The continuation of the second subject, with duets first for two violas and then for two violoncellos, is particularly pleasing; and the form of the whole movement is so well defined as to leave a most clear and satisfactory impression on the hearer. The scherzo, which, as in the octett, precedes the slow movement, is full of clever fugal and imitative passages. The trio in the major is exceedingly elegant; and at the return of the original theme the two subjects (of the scherzo and trio) are worked together in a most ingenious manner. The third movement, in C major, consists of an air with variations, which must, on the whole, be pronounced more ingenious than pleasing. The subject itself is somewhat dry; and the elaborations, therefore, as might be expected, are also deficient in charm. One of the variations, however, a double canon in the octave in six parts, deserves especial mention as a masterpiece of scientific contrivance. The finale is another movement which interests more from its clever construction than from its themes. These are full of character and well contrasted; but they do not "draw blood" (to use old Gluck's phrase) like the subjects of the first movement. It seems as if Raff had taken the first ideas which presented themselves, and set himself to show how much could be done with apparently not very promising materials. For this reason the sextett must, as a whole, rank somewhat below the octett; though had the high excellence of the first two movements been sustained it would have certainly been the better work of the two.

The two quartetts by Johannes Brahms are among the most original works of this always original composer. They are, moreover, so complex in construction and so excessively abstruse, not to say obscure, that it is very difficult to pronounce a decided opinion on them. The first one, in C minor, was produced at Mr. Coenen's first chamber concert last season, but in spite of the excellence of its performance failed to create much impression. This was no doubt partly due to the very recondite character of its themes, but still more, we think, to the want of clearness in its plan, thus furnishing an additional proof of the correctness of the statement made above, that there is little to gain and much to lose by abandoning the orthodox forms. These are not entirely thrown over in the present works; but they are so overloaded and obscured by the superabundance of episodic matter that it is very difficult to trace them. At the same time, there are isolated portions of the music which are of rare beauty—such as the slow movement of the first quartett, and the opening allegro of the second, in which Brahms's genius shines out clearly and unmistakably. Any detailed analysis of these works would be not only very difficult, but quite unintelligible without the aid of music type; it is enough to say that they contain much that will interest musicians, though they are never likely to equal in popularity their composer's sextetts or the

quartetts in G minor and A. It is a curious thing that when on several occasions they have been recently performed in Germany, the verdict of the musical critics has almost always been that they were works on which it was impossible to pronounce an opinion without repeated hearing.

Rheinberger's pianoforte quartett is a work of a totally different stamp. Here we leave the regions of mysticism, and descend to the lower, but more enjoyable, level of ordinary musical intelligence. There is a healthy straightforward character about this work which commends it to the hearer at once. The flow of melody is unceasing, the ideas are always pleasing and readily appreciable, and the technical treatment shows the thoroughly accomplished musician. The first allegro, in E flat, interests at once by its commencement; and the attention, arrested by the opening theme, is well sustained through the whole of a somewhat amply developed movement. The following adagio, in G major, begins with a beautiful melody given to the strings alone, and then repeated by the piano; the subsequent elaborations are ingenious and effective. The following minuet and trio are most charming, full of quaint grace, and highly original: this is on the whole the best portion of the work. The finale is a most animated movement, the themes of which are no less pleasing than their predecessors. At the close a reminiscence of the opening phrase of the first allegro is introduced to give unity to the whole composition. The entire quartett is thoroughly enjoyable, and has the additional advantage of not being unduly difficult. The pianoforte part is brilliant, but quite within the reach of good amateur players, and there can be no doubt that the more the work becomes known the larger will be its popularity. EBENEZER PROUT.

As Mr. John Hullah, the present musical inspector in the Training Colleges, finds the work of examination too large for him to undertake single-handed, Mr. W. A. Barrett, Mus. Bac., of St. Paul's Cathedral, has been appointed assistant inspector. Those who know Mr. Barrett will feel that the appointment is a most judicious one.

MR. C. W. FIELDING, one of the vicars choral of St. Paul's, and one of our best alto singers, is dead.

MESSRS. NOVELLO, EWER & Co. have, it is said, taken a lease of the Albert Hall for three years, and intend giving classical concerts, oratorios, chamber music and "Wagner Concerts." Messrs. Barnby, Sullivan and Dannreuther are named as conductors, and a permanent orchestra is to be engaged.

MR. CHARLES LAMOUREUX announces his intention of producing Handel's *Judas Maccabaeus*, with French text, at Paris, during the next season of his operatic concerts.

POSTSCRIPT.

A GENERAL meeting of the London and Middlesex Archaeological Society will be held at Fulham Palace on Tuesday, the 11th inst., at one o'clock.

Nature remarks that few people are aware of the important explorations now being conducted in the South-east of Costa Rica, by Professor W. M. Gabb, with four assistants. As might have been expected, the geological structure of the country has occupied a large share of Professor

Gabb's attention, and enough has been discovered to warrant the belief that the mineral resources are of great importance. The greatest interest attaches, however, to the discovery of two previously unknown volcanoes, not less than 7,000 feet high, in the main cordillera just north-west of Pico Blanco. Of these he is about to make a thorough examination. The natural history collections made by the Professor are of unusual magnitude and value, embracing all departments of zoology, and especially rich in mammals, birds, reptiles, and insects. Of fish there were but few species, but all that could be found were secured. The ethnology and philology of the country have been attended to very thoroughly. Material illustrating the manners and customs of the people was also gathered in great quantities, and important discoveries made of *Amucos*, or prehistoric graves. In addition to these, Prof. Gabb is on the track of an ancient buried city, of which no mention is made in any history of the country. An important geological discovery made by him is that the appearance of dry land on the isthmus is of Tertiary date, and that it is coeval with the period of volcanic excitement in the Californian sierra.

THE Basle papers report the death of two men, Professor Wilhelm Vischer and Herr Peter Feddersen, who respectively attained to honourable distinction. In the former, Basle has lost one of its most efficient teachers; his lectures on classical literature being among the best attended and most highly valued in the entire curriculum of the university. Although a German by birth, P. Feddersen had thoroughly identified himself with the interests of the republic in which he had found a safe asylum in times of political disturbance in Germany, and for many years he had held a seat at the council-board of the canton, a distinction never before awarded to a foreigner. He had also for a long time conducted the *Swiss National Journal*, whose pages gave frequent evidence of the learning and the sound judgment with which he considered the leading questions of the day. His *Downfall of Poland, its Struggles and Resuscitation*, which was published at Basle in 1863; and his later work on the *History of Swiss Regeneration* (Zürich, 1867), have considerable merit, and are held in high esteem among Polish and Swiss readers.

LITERATURE.

Telegraph and Travel: A Narrative of the Formation and Development of Telegraphic Communication between England and India, under the Orders of Her Majesty's Government, with Incidental Notices of the Countries traversed by the Lines. By Colonel Sir Frederick John Goldsmid, C.B., K.C.S.I., late Chief Director of the Government Indo-European Telegraph. (London: Macmillan & Co., 1874.)

ONE of the later acts of the East India Company was to engage, a little inconsiderately, perhaps, that if the Turkish Government would construct a line of telegraph from Constantinople to the head of the Persian Gulf, the line should be continued to Kurrachee, and connected there with the telegraphic system of India. The pledge having been given in 1856, its redemption was claimed in 1859; and Sir Charles Wood, now Viscount Halifax, who then held the sceptre that had fallen from the hands of the virtually defunct Company, proceeded loyally to make the requisite arrangements. It opportunely happened that a young officer of the Royal Engineers was at the time in England on sick leave. This was Brevet-Major—presently afterwards Lieutenant-Colonel—Patrick Stewart, in whom a rare combination of fine qualities gave promise of additional distinction even to the distinguished corps to which he belonged. Young as he was—barely thirty years of age—his short life had already been crowded with adventures numerous and extraordinary enough for a hero of romance. According to one story told of him—for he was not easily persuaded to talk of himself—he had been left standing on the window-sill of a house when all but the front wall of the building had fallen down behind him, overthrown by an earthquake. This may be somewhat apocryphal, but there is no doubt that on one occasion he was carried for several yards between the jaws of a tigress, which, however, then dropped him, horribly torn and mangled indeed, but without having undergone the last finishing crunch. On another, he encountered single-handed two bears at a time, of which he shot one, while the second got away only because it ran faster than he could follow. He took a prominent part in the relief of Lucknow, where he lost his horse, and where he did his best to get himself killed likewise, in defiance of strict injunctions from both the Governor-General, Lord Canning, and the Commander-in-Chief, Sir Colin Campbell, “not to get shot if he could help it.” Gallantry, however, was far from being his sole characteristic. His singular versatility of talent fitted him for the most varied duties, while his sweetness of disposition and charm of manner made him a favourite with

high and low. During his ten years' service in India, he had conducted extensive survey operations, had been employed as a road-maker on a grand scale, and, first as *locum tenens* for, and afterwards as assistant to, Sir William O'Shaughnessy, had greatly signalised himself by his co-operation with that able and energetic functionary, in improvising the Indian network of telegraphs and bringing their resources to bear on military operations during the Sepoy War. The reputation gained by him in these last-mentioned capacities naturally commended him to Sir Charles Wood's notice at the particular juncture we are speaking of; but very naturally too, the selection of a young soldier for the chief direction of an enterprise involving the fabrication of nearly fifteen hundred miles of telegraph cable, and their immersion among the depths and shallows of the Persian Gulf, took even disinterested on-lookers by surprise, and caused civilian experts to shake their heads angrily and to mutter audibly between their teeth the uncivil word “job.” Results, however, amply justified the Secretary of State's choice. The cable ordered by Stewart from the Messrs. Henley, then a comparatively obscure firm just struggling into the manufacturing celebrity they have since achieved, turned out to be the best as well as the cheapest that had till then been produced. Within eighteen months after the order had been given, it was snugly laid from the neighbourhood of Bussorah to Guadur, and thence to Kurrachee; and from that time to this the cable has been worked with a celerity and regularity nowhere surpassed, and scarcely anywhere equalled.

As yet, however, the work was but half done. The pledge given by the East India Company to the Porte in 1856 has been hinted at as inconsiderate, and was certainly premature. The telegraph running through Asiatic Turkey, from Scutari to Bussorah, was no sooner linked with India by means of the Persian Gulf cable and the Mekran coast land line than it was discovered to be altogether unworthy of so honourable an alliance. Consisting, to begin with, of wretched materials wretchedly put together, it was, into the bargain, so wretchedly handled, that a telegram flashed in a few minutes from Kurrachee to Bussorah, took days and sometimes even weeks to get to Constantinople; whence, thanks to the apathy and mutual jealousies of Ottoman, Servian, Austrian, Bavarian, Prussian, Belgian and Dutch administrations, its onward progress was often slower still, insomuch that impatient correspondents might reasonably doubt whether the ordinary post would not serve their purpose better than an electric chain composed of such heterogeneous sections. Nor were matters very sensibly mended by the construction, at the instance, and in great part at the expense, of the Anglo-Indian Government, of an alternative and thoroughly efficient line of telegraph through Persia from Bushire to the Russian frontier. In order that this should become really serviceable it was still essential to render the line to England through Russia and Northern Germany equally efficient, which indispensable part of the business, although undertaken by the Brothers Siemens—*par nobile*

fratrum—the originators and moving spirits of the Indo-European Telegraph Company, was attended by so many difficulties, diplomatic and other, that it was not accomplished until 1870. Meanwhile, in January, 1865, poor Stewart had died suddenly at Constantinople, a victim, in mid career, to fever superinduced by obstinate persistence in exertions far too severe for an already sorely overtaxed constitution, and had been succeeded in his arduous office by Colonel—now Sir Frederick Goldsmid—with Major Bateman Champain of the Royal Engineers, for deputy. Among the manifold labours devolving on these officers were the actual construction of the Persian land lines; the doubling of the Gulf cable in some parts of its course and its diversion in others; and the conduct of several diplomatic negotiations of not a little delicacy and difficulty; and of both officers it is at once but simple justice and the highest praise to say, that together with Stewart's functions and responsibilities, Stewart's mantle also seemed to have descended upon them in joint inheritance. To them and to the Messrs. Siemens, not less than to Stewart, the public are indebted for the present Puck-like speed of intercommunication between England and India, from one to the other of which countries telegrams can now, in cases of urgency, be sent in twenty minutes, and have not, during the last year or two, averaged much more than a couple of hours in transmission. To the operations which have resulted in so happy a consummation, and of which Sir F. Goldsmid may so justly say *pars magna fui*, he has devoted the first half of the volume before us, telling his story with characteristic modesty, but at the same time with a comprehensiveness of plan and a fulness and accuracy of detail calculated to make the record, irrespectively of its immediate interest, one of permanent value to all persons in any way concerned with practical telegraphy.

But, although the first half will amply repay perusal, it is the second moiety of the book—the portion devoted to “Travel,” wherein the author describes the various journeys undertaken by him in connexion with his telegraphic duties—that is most likely to attract the general reader. One of these journeys was from the mouth of the Shat el Arab, the great river formed by the confluence of the Euphrates and Tigris, to Constantinople, through Turkish Arabia, Turkish Kurdistan, Upper Mesopotamia, and Asia Minor. Accompanying Sir Frederick on this expedition, we halt for a while at Bagdad, taking up our quarters at the British residence, where Colonel, now Sir Arnold Kemball, “kept very much open house, open stables, and to no small extent open purse, for the entertainment of his frequent guests,” but dining once or twice with the Pasha and other Turkish grandees, at whose tables “drinkable champagne and bad sherry were passed round at a hospitable but dangerous pace,” and feasting them in return. Between whiles we stroll about the town and compare its actual aspect with the fancy picture left in our minds by recollections of the Arabian Nights. The contrast is not agreeable. Bright are the golden domes

over the shrine of the Kasims, and weirdly picturesque is the tomb of Zobeide, but all else must surely have become sadly tarnished in the long interval between "the goodly time, the golden prime of good Haroun Alraschid," and the leaden sway of Namick Pasha.

"The streets," says Sir Frederick, "are narrow, dirty, gloomy, and irregular; there is nothing about the dwelling-houses, even the best, to make them desirable, except it be the position which in some cases combines the advantages of garden and river. Here and there is a prettily domed mosque, but painfully like a crockery 'finjan,' or coffee cup, of blue flower pattern. Perhaps the most remarkable characteristic of the town is the large concourse of Muhammadans, whether Persian, Turk, or Arab; and when to these are added the Syrian and Chaldean Christians, Jews and Armenians, it may well be conceived that the public thoroughfares are not wanting in picturesque groups and the echo of divers tongues. The gardens, in spite of the exaggeration of Eastern poets, who would lead the reader to imagine every garden a kind of terrestrial paradise, exhibit nothing in comparison to the highly-cared-for horticulture of Europe. There is a wildness and untidiness which may be very charming in their way, but which are not likely to meet with approval from the fastidious *habitués* of Chiswick and like fashionable resorts both at home and abroad. Still there are flowers and shrubs meriting favourable notice, and the orange trees and pomegranates are not to be slighted.

"The grounds known as 'the gardens' *par excellence*, are traversed by a wide thoroughfare intersected by water-courses roughly bridged over as in India. On either side, long mud walls, with gates more or less rude or ornamented, mark the different allotments. Some are private property, some 'wakf' or religious bequests. But the term 'garden' is here again not according to our English dictionary. These are rather date plantations, overgrown with gross and wild vegetation, and varied with irregularly planted trees. The river of Bagdad is no doubt the main feature of the place; but muddy walls and muddy waters are too much the rule, and fresh green trees and bright edifices too much the exception to make the *tout ensemble* attractive."

Leaving the City of the Caliphs, we put up sometimes among wandering Arabs, duly appreciating "those laughing curious faces of Arab girls looking over the partition between their part of the tent and ours"; sometimes among Kurdish villagers who "cook us a splendid omelette and bring it in a frying-pan, together with other savoury ingredients of a travelling breakfast." At one place a wealthy Saiyid invites us to dinner, and when, after doing our best to avoid surfeiting ourselves with the multitudinous dishes which follow each other in rapid succession, we rise to depart, thanking him for his hospitality, prevents our supposing that any special compliment to our personal merit had been intended, by quietly replying, "Siz musafir," "Travellers ye." At Mosul, we call after breakfast on the Chaldean Patriarch, and the Syrian Bishop, and next morning the Syrian Bishop comes to breakfast with us, when we discuss with him experimentally and orally the relative claims of the two rival kinds of Mosul wine.

At Angora Sir Frederick, after bidding us admire the striking effect produced by its fort-crowned hill, and drawing our attention also to the Roman ruins scattered about, proceeds as follows:—

"But the classical or beautiful inanimate is not

all that is here calculated to arrest the inquirer's attention. Angora has what may be called a determinate reputation for goats, and an indeterminate reputation for cats. To the truth of the first I can testify from the sight of the most lovely of their species—exquisite little caprioling quadrupeds of drooping, silky coats, admiration of which even the fatigue of a weary march could not restrain. As regards the cats, my experience of them is confined to specimens shown in Europe, for not one could I find in Angora, where they told me I must be looking for the 'Van kedis,' or cat of the Lake Van.

"The famous goats, producing a wool renowned over the world, abound in the vicinity of the town from which they derive their name. It is said that they are only found within certain circumscribed limits, which may be defined as between the left bank of the Kizil Irmak and Sevri Hisar, the latter place marking the most southerly point, and the Black Sea being the northern boundary. A space of 500 geographical square miles may here be assigned, from which removal would cause deterioration. It is represented to be a known fact that if transferred to the east bank of the Kizil Irmak, they suffer from the *mal de pays*. Many are lost from exposure, but the losses are made up for by herding with common goats, and caste is supposed to be recovered in the third generation. The Angora goat gives, I have learnt, one oka, or 44 ounces avoirdupois, of wool; and the quantity supplied throughout the wool region is estimated at from 350,000 to 400,000 okas, i.e., 962,500 lbs. to 1,100,000 lbs. From the same authority it appears that 40,000 okas (110,000 lbs.) are expended in thread manufacture in Asia Minor itself, of which more than half is sent to Holland, and 8,000 to 10,000 okas (17,500 lbs.) are converted into home-made shawls and stuffs."

This journey through Asiatic Turkey took place in 1864. In the following year, Sir Frederick, having returned in the interim to England, was again set moving, charged by the Secretary of State for India with a special mission to Teheran. The route he chose was through St. Petersburg, Moscow, Astrakhan, and the Caspian, in the course of his voyage through which latter he landed at Baku, in order to look at the wonderful natural fires in the neighbourhood.

"To say that these fires are curious, are worth seeing, is to say nothing. They are marvellous, and worthy of classification among natural wonders. There is a large tract of ground near the sea, on the peninsula of Absharan, out of which gas issues in profusion. The whole soil appears to be impregnated here with naphtha, and the application of fire to the vaporous region will cause a flame to arise, extinguishable only by water or smothering. Many flames are aroused and kept alive for use in various ways. In the kitchen of our host, for instance, they played a conspicuous part, cooked his meat, boiled his water, warmed such things as had need of warming, and served to economise domestic labour. The aspect of the fires at night gives the notion of a watchful camp. Many are built upon; that is, the fire is carried through a conductor raised upon it. Each of the two stone pillars at the factory gate is thus surmounted with a high, bright flame."

Teheran, albeit the modern capital of Persia, is described as "a confused mass of narrow and miserably-paved streets, with outlying passages and highways of more promise, such as here and there an embryo boulevard or a carefully-lined road. The bazaar is good of its kind, and has its architectural merits; the caravanserais also deserve honourable mention, and the telegraph and arsenal might pass muster as Oriental institutions. There are, moreover, a few respectable houses, occupied by European

legations or Persians of distinction; but the palace and its adornments are not such as the Shah-in-Shah can be very proud of after his visit to Europe and his acquaintance with the abodes of European monarchs." Few monarchs, however, have finer crown jewels to be proud of. "Magnificent pearls, a special pearl watch-chain, diamonds of wondrous size and beauty in the shape of rings and pins, tray after tray of bewildering valuables of all sorts; the Daria-i-nur or Sea of Light, a diamond brought from Delhi by Nadir Shah, and said to have been depreciated to the value of a million sterling by the mere scratching on it of the name of Fath Ali Shah; the Aurungzeb ruby in the crown, massive but murky; coats of poor cloth, lavishly bedecked with the costliest jewels;" such is our author's attempt at enumeration of the glories of the royal treasury.

After completing his business at Teheran, Sir Frederick proceeded to Ispahan, and thence through Yezd and Kerman to Beloochistan and Mekran; but through this, although in many respects the most interesting portion of his peregrinations, space forbids our following him. To induce our readers to track for themselves the footsteps of so agreeable and instructive a guide, it may, perhaps, suffice to remark that over some of the easternmost portions of the route, probably no other European than himself had passed since Pottinger trode it sixty years ago.

Among the recommendations of Sir Frederick Goldsmid's work, the admirable woodcuts by which it is copiously illustrated must not be passed over unnoticed. The views of places from photographs or original drawings are all of them very good, and some of the figures are capital. The Persian *chasseur à cheval* on page 324, and the Turkish artilleryman and infantry sentry on page 428, are quite in Thackeray's style, as comic, yet true to life, as any of the droll delineations of the *Irish Sketch Book*.

W. T. THORNTON.

GEIGER'S PETRARCH.

Petrarka. Von Ludwig Geiger. (Leipzig: Duncker & Humblot, 1874.)

HERR GEIGER, the author of a valuable biography of Reuchlin, has followed up his previous work by a no less successful attempt to revive the memory of another leader of the Humanists. If, in celebrating the Fifth Centenary of Petrarch's death, Italy has this year been not unmindful of him who made Italian greatness and unity the dream of his life, all Europe has a deep debt of gratitude to pay to the memory of the reviver of classical learning. Herr Geiger has availed himself of the opportunity of undertaking a task which for almost half a century has been left untouched by German writers. He has made no attempt to write a voluminous biography, or to take a critical view of the poet's life in connexion with the history of his time. His object is rather to sum up the results of modern publications relating to Petrarch's personality and work, especially of the large collection of letters edited by Fracassetti. In this way he has been able to give due place to the facts

which have been brought to light by the labours of modern scholars, and to sketch the broad outlines of Petrarch's life, as well as to form an estimate of his place in literature.

Herr Geiger's task has been well performed. He has arranged his materials with considerable skill, beginning with words taken from Petrarch's letter *ad posterum*, which contains to a certain extent an autobiographical narrative by the poet himself. The book is divided into three chapters, "Petrarka und der Humanismus," "Petrarka und Italien," "Petrarka und Laura," naturally corresponding with the relations of its subject as a writer, a patriot, and a lover.

In the first chapter Petrarch appears as the hero of a new epoch of civilisation, the unwearied pioneer of modern culture, the foundations of which are deeply laid in classical learning and literature. Versed in almost every branch of knowledge which it was possible in his days to acquire, and a firm adherent by conviction to the doctrines of Christianity, he combated superstition and obscurantism with unflagging energy. He won the poetical laurel by his mastery in Latin versification, the true work, as he understood it, of a poet, and that which alone could give to any one a title to bear that honourable name.

In the second chapter we are reminded how Petrarch ever expressed his fervent love for his native land in prose and verse, especially in his celebrated canzone *Italia mia*. Without being a professional politician the poet was closely connected with many of the princes and governing bodies of Italy. If the various political missions which he occasionally undertook do not bring to light any real capacity for state affairs, they at least enable us to recognise in him the honest and liberal patriot: out of his love for Italy he conjures the representative of the Papacy to return from his banishment at Avignon to the Holy See of Rome, and the same cause awakens in his breast a glowing sympathy for the fantastical exploit of Cola di Rienzi, a sympathy which became tinged with melancholy as the daring undertaking verged towards its ultimate failure. From the same feelings he at last turned his eyes upon the Emperor Charles IV., and entered upon a sort of amicable intercourse with the man who, foreigner as he was, was still the legitimate representative of Italian kingship, though his chimerical hopes were necessarily doomed to disappointment, when Charles began to show by his political behaviour towards Italy that he neither cared for nor understood the country which the poet had commended to his protection.

Herr Geiger's readers will, probably, be chiefly interested in his delineation of Petrarch's relation towards Laura, and it need not be said that he has not neglected any point of this often repeated tale of love. He has shown great skill in interweaving with it some notices of the poet's family history, and in introducing specimens from the celebrated sonnets, which were the passionate outpourings of the lover's heart. Even after Herr Geiger's careful examination of the evidence which has reached us, it may still be doubted whether the Abbé

de Sade was not right after all in holding that the Laura immortalised in these poems was a married woman. There is not space enough in these columns to give even a brief abstract of the arguments on either side of the question, and it will be enough to remark that whatever Herr Geiger may say on aesthetic grounds against De Sade's view of the case, there is, as every student of poetical biography knows, no inherent improbability in it.

Herr Geiger's style is at once vigorous and graceful, not without a certain tincture of classical simplicity, though he is sometimes too prolix in his general observations. Sometimes too, as for instance at p. 138, he might have paid more attention to the accuracy and elegance of his translation of the Italian and Latin verses of the author.

ALFRED STERN.

Tiberius Leben, Regierung, Charakter. Von Adolf Stahr. (Berlin: J. Guttentag.) (First Notice.)

IN its new form Herr Stahr's monograph is the completest and most adequate representation we have of one of the greatest of Roman generals and administrators. It is very seldom that we meet with an apologetic work which really makes its subject intelligible, and this Herr Stahr has certainly achieved. He constantly complains that the Tiberius of tradition, the Tiberius of Tacitus, is a "monster," and he has succeeded in substituting a man. He owes his success to a persistent endeavour to contemplate Tiberius's character and conduct as a whole, beginning at the beginning and going on to the end, instead of beginning at the end and then looking back to the beginning. It is this which makes his portrait more intelligible, more consistent and complete, than Dean Merivale's, who, there is reason to think, appreciates many individual points more accurately than can be expected from an avowed advocate. It cannot be repeated too often (and Herr Stahr repeats it very often) that, up to the age of fifty-six, Tiberius was an excellent public servant, who bore a deservedly high character; that up to the end of his reign his general administration continued to be unmistakeably conscientious, and even in some conspicuous instances imperially beneficent; and that in the provinces his government left an enviable reputation. Whatever reason there may be to admit that there were defects in Tiberius's character from the first, that after his accession, or after the death of Drusus, or after the execution of Sejanus, these defects developed into crimes, it is still true that his crimes or his faults are not the substance of his career, and it is the substance of his career that Herr Stahr has been the first to treat with adequate knowledge and completeness. Another merit of his treatment is that he has tried steadily, and upon the whole successfully, to place himself at his hero's point of view; and in this way much becomes reasonable and coherent which is puzzling and offensive in Tacitus, because Tacitus describes the impression Tiberius made upon public opinion, which was always attacking him upon shifting and inconsistent grounds.

Of course an explanation is more than half

a vindication. When we are occupied with the question what a man exactly was, and how he came to be what he was, the question whether we like him or approve of him sinks into the background; for instance, Herr Stahr succeeds very completely in showing how natural it was that Tiberius should allow the aristocracy to tear each other to pieces, as they were always eager to do, under pretence of defending him against the disloyal designs they imputed to one another; and, as we follow the exposition, we lose sight of the responsibility of the Emperor as head of the aristocracy. Yet this last was a point that contemporary Roman opinion could not neglect; and a method which leads to leaving Roman opinion out of sight is a misfortune, as is proved by the errors into which it has betrayed our author. He assumes from first to last that it is Tacitus and Suetonius who have written down Tiberius—Tacitus because he had to rehabilitate himself for his servility under Domitian by aristocratic and senatorian zeal; Suetonius, because his appetite for gossip made him indifferent to truth (though Herr Stahr makes Suetonius go out of his way tacitly to correct a statement of Tacitus); and that the reason that a *parvenu* aristocrat had to vilify Tiberius was that the aristocracy had espoused the cause of the Julian branch in the family of Augustus against the Claudian; in fact, that Tiberius would have enjoyed his just reputation as a great and good ruler if Tacitus had not decided, in the interests of his party, to write his history from the memoirs of the younger Agrippina. All this is misconception—there is no evidence for the improbable propositions that the senate was flattered by the deification of Julius and Octavian, or regarded the Claudii as less noble than the Julii (who were of secondary importance till the day of the great Julius); and the way in which Tacitus mentions the memoirs of the younger Agrippina as his authority for one fact passed over by the writers of annals makes for the belief that in general he followed the consent of other writers. It is very possible that the authority of Agrippina may have warped the narrative of the relations between Tiberius and Germanicus and the family of the latter; but this is all we are justified in assuming. Herr Stahr extends the assumption to the whole history, and he builds upon it as freely and ingeniously as Tacitus builds upon the assumption that Tiberius was a tyrant.

If it were possible to approach the subject without prejudice we should probably find that Tacitus had quite a right to pique himself on his impartiality; he assumes that Tiberius had some of the most serious faults a ruler can have, that during the early part of his reign these faults were repressed, and that one after another they got loose, and gradually overpowered his good habits. This assumption can hardly be all the truth, for this reason, among others, that it leaves the good habits unaccounted for; but if we suppose it to be true in the main, as far as it goes, we see that Tacitus tries throughout to be discriminating, and is fair on the whole, though, in spite of his efforts, we can see traces of an unmistakeable hostile prepossession. The five or six sentences in which the great historian takes leave of his subject are to

be read in the light of the narrative which they resume; they are the record of the final impression of Tiberius's career; it is hardly a legitimate procedure to draw out and sometimes exaggerate (*egregius* means less than immaculate) the propositions they involve, and then apply these separately to the different stages of that career. It would have been better, instead of sacrificing everybody, historians and contemporaries, to Tiberius, to have tried to discover a theory of his character which would include not only the facts on which it is Herr Stahr's merit to have insisted adequately, but those factors which contemporaries based their estimate. No doubt those contemporaries were corrupt and spiteful; * but it does not follow that their estimate always proceeded from corruption or spite, or that a historian is never to repeat and endorse the judgment of contemporaries unless he can reproduce all the evidence it rested on. The contemporaries of Tiberius were in a position to know if it was true that Livia's influence made his rule milder, and that he thought it a good thing that Germanicus died when he did; and a historian might fairly repeat both facts without proof, if they were believed at the time. Of course the facts might be false; and it is possible to make almost any theory good if a man will resolutely exhaust in its favour every hypothesis which is separately permissible, rather than try another theory which fits parts of the evidence more naturally.

Probably the character of Tiberius is one of the problems on which we may expect much light from the progress of physiology, which will reveal to us many definite possibilities of human nature, one or more of which will prove the key to his life. He seems to have been one of the men whose power of assimilation, both moral and intellectual, is greater than their power of initiation. In his nephew Claudius the same contrast was heightened to a grotesque extent; he could not speak coherently, but Augustus was struck by his declamation; when he had to establish connexions between words or between ideas for himself, he was positively shortwitted; when he had to use and combine connexions already established, he was rather clever than not. The defect in Tiberius's power of initiation did not amount to imbecility as it did in Claudius, but it was accompanied from the first by a certain perversity which contrasted with the sheepish good nature of his nephew. On the other hand, Tiberius's power of assimilation was so robust as to amount almost to genius, especially in military matters, where his combinations were so extensive and precise as to have a look of positive grandeur and originality; though even here the element of insight and invention is less, it may be, than in less meritorious commanders who acted on a smaller scale. It is to be noticed that he was a pre-eminently cautious and anxious commander. We have a letter from Augustus, showing that he accepted the demoralisation of his troops as an irremediable fact, and

made his dispositions accordingly. Augustus found the dispositions admirable, and Augustus was doubtless right; only, without depreciating the extent of Tiberius's excellence, it is permissible to mark that it was of a special kind. Though he attached the troops to him, and they were glad to get him back, he was not one of the commanders who can inspire courage and superiority to danger. In this connexion it may be observed that the Claudii, whose representative he was, seem to have had little military aptitude. Contemporaries seem to have been struck by his inheriting the "ferocity" and arrogance of the Claudii: it has been questioned recently whether all anecdotes in support of this view of the family were not invented by Licinius Macer, because it can be shown that the Decemvir and Appius Claudius Caecus were not loyal to the patriciate or the nobility; and were proud, if they were proud, for themselves, not for their order. It is certain that Tiberius's manners, from the first, were marked by the kind of reserve that is considered haughty; and Augustus had to apologise for him to the senate, with the observation that his nature, not his will,* was to blame. This is probably to be understood not only of his *gaucherie*, but of his turn towards severity. We are told (apparently before his exile) of Augustus gently reproving him for treating libels (on Augustus) as intolerable, *i.e.*, matter for heavy punishment, because he could not see that, as Augustus told him, the essential thing was not that nobody should be able to speak ill of the new dynasty, but that no one should be able to injure it. All through his life Tiberius underrated the necessity and stability of the new order of things. Drusus, his brother, who was open-handed and popular, may very likely have underrated this necessity still more. There is no reason to doubt that contemporaries thought, and quite rightly, that Drusus had some notion of restoring "liberty," or even that Suetonius had seen a letter which he had written in this sense to Tiberius about the advantages of forcing Augustus to act on his repeated professions, and allow his extraordinary powers to expire. The sons of Livia could have commanded continued employment and authority from their fellow citizens more certainly than from the husband of their mother. It is quite in accordance with the scrupulous, jealous temper of Tiberius that if he received such a letter he should have thought it the safest course for himself to show it to Augustus; even the kindest course to his brother, as proving the matter was no worse. Suetonius finds in this the first instance of Tiberius's tendency to quarrel with his relations. As he certainly loved his brother, we are tempted to set aside Suetonius's story and his reflection as mere spiteful gossip. On the other hand there are people whose nature it is to fret under ties which they have no wish to break, and always to be complaining of relations whom they would miss; and it will be seen hereafter that Tiberius probably belonged to this unfortunate class.

Herr Stahr is undoubtedly right in insist-

ing on the great injury done to Tiberius in his divorce and second marriage. His first wife suited him perfectly: she was a daughter of the bluff, good-humoured Agrippa, whose motto had been that concord makes small things great, and discord makes great things small. Tiberius doted upon her, perhaps because she was friendly and homely, and relieved him of himself as wine did in another way (for there is not the slightest reason to doubt Pliny's statement that he drank hard in a quiet way; and the story that he, when emperor, appointed two of his cronies, Piso and Pomponius, to high offices after a long drinking bout, with the remark that they were friends for work and playtime,* is not like an invention). He had caught the fancy of Julia during her husband's life, which was an additional reason why Augustus should be willing to gratify his wife's ambition by bestowing his widowed daughter upon his stepson, although to do so it was necessary to break up a happy home. Julia soon tired of her bargain. Tiberius was tall and handsome, but he was very short-sighted, and (to break himself most likely of a consequent tendency to poke and peer) he had contracted a habit of stalking about with his head thrown back. Julia, whose own manners were very good, was ashamed, for this reason or for others, of her shy, morose, undignified husband, and came to a conclusion, too natural to need much support from a comparison of the nobility of the Claudii with that of the Julii and Octavii, that her stepmother's son was not a match for her father's daughter. She abandoned herself to her passions, and she employed her parours to help her libel her husband. Meanwhile her sons were growing up; her father doted upon them; and, though he conferred the tribunician power for five years upon Tiberius, he accompanied the gift with an Eastern mission that was not unlike a banishment. Tiberius had reason to feel himself ill-used—as if his home had been broken up in order that he might be qualified to act as a stopgap till the sons of his false wife should be old enough to step into their father's inheritance. He was probably right in believing what a more generous man would not have believed—what a wiser man would have ignored, though he believed it. His conduct was characteristic: he was not man enough, as Herr Stahr admits, to have his grievance out with Augustus; he was not man enough to do his duty in the East without *arriver pensée*, and come back to fight for his position, if need were, with another claim to public gratitude. He simply gave way to disgust at his situation, pretended that his health had broken down, and insisted upon going to Rhodes and studying philosophy. Under similar circumstances Agrippa had gone to Lesbos when it was desirable to have him out of the way of Marcellus; but Agrippa had not refused his commission, though he had committed its execution to lieutenants. Tiberius, no doubt, had more speculative curiosity than Agrippa; he had more of a perverse conscientiousness; he persuaded himself that he had had his turn, and that it was his

* Even this is in one sense a presumption against Tiberius. We are to expect great faults in the best representatives of a vicious class and period.

* *Naturae vitia esse non animi.*

* "*Omnium horarum amicos.*"

duty to make room for the young men. Augustus had not by any means decided to discard him, and begged him to waive his request, which he saw better than Tiberius would be taken, and quite rightly, as an insult. But Tiberius was too weak to change his mind freely, and too headstrong to yield to pressure. After fasting for four days he was allowed to go to Rhodes; and, when he asked to return, he was forbidden to do so until his wife's son had given his consent. During the latter part of his exile he was in positive danger, and with his natural mean-spiritedness wrote to Augustus asking to be placed under surveillance. We are told that he led the life of a sullen voluptuary; if the charge were true it was not of a kind to affect his real reputation, though it would lay him open to a good deal of insincere invective. Soon after his return the way to the throne cleared itself again by the death of the two elder of Augustus's grandsons, whose "will to live" might have been stronger, but for the knowledge that Livia wished them away, and who may well have fancied themselves poisoned when they were simply too *blasés* to throw off colds or fevers. Augustus had to adopt Tiberius "for the sake of the Commonwealth," and Tiberius, having no tact to guide him in his new relation, fell back upon punctilious propriety, and never allowed Augustus to forget for a moment that he was under *patria potestas*: otherwise the years in which he was associated with Augustus in the empire were the best and most prosperous of Tiberius's life; they are the time of his brilliant campaign against Marbod, who had established a formidable power in Bohemia, and of the reconquest of Pannonia and Illyricum from which Augustus repeatedly asked him to withdraw, and of the well-conducted military promenade in Germany, which did something to retrieve the honour of the eagles after the disaster of Varus.

G. A. SIMCOX.

Scottish Rivers. By the late Sir Thomas Dick Lauder, Baronet, Author of the "Morayshire Floods," &c. With Illustrations by the Author and a Preface by John Brown, M.D., Author of "Rab and his Friends," &c. (Edinburgh: Edmonston & Douglas, 1874.)

DR. JOHN BROWN calls this, in his pleasant preface to it, a delightful book; and Dr. John Brown is a good judge. A delightful book it certainly is, and delightful in no ordinary way. Although it is not thirty years since the author left it unfinished at his death, it is already in some sense an antiquity. The style is farther away from us than many styles older in point of date. There is throughout a sort of ponderous editorial levity, that has now gone somewhat into disuse. We are saluted as "gentle reader" and "gentlest of all readers." Social gossip about men and things and perpetual compliments to the nobility and gentry, by whose estates the river may chance to go, speak to us of a time when Scotland was to some extent a separate country and an author could address himself to a Scottish public, almost small enough to deserve the name of a clique and with a

clique's special knowledge and special readiness to be pleased. In speaking to us as he does, we feel that the author is treating us as one of the family. His garrulousness has all the character of personal intercourse. We begin to regard his "old and much valued friend, General Sir James Russel," as an old and much valued friend of our own; at least, we are sure the author would be glad to give us an introduction, not only to him, but to all the friends and acquaintances who come in his way, and so frank us, for a whole holiday, from one country house to another, all over Tweeddale and the valley of the Tyne.

This is just one of the qualities that make the book delightful. It is in no literary sense, it is merely from the pleasure of making a loveable acquaintance and going through interesting scenery, that we can accord it merit. We have called the style editorial; indeed, it is not unlike that of a provincial editor's description of the annual games, with just such little touches of personal compliment as the editor would deal out to his distinguished fellow-townsmen and the various successful competitors. Now, at first sight, one would have thought that a book like this would depend almost entirely upon style; that a book which merely promises to set forth to us, with appropriate gossip, the changeable character of the valley of one river after another, if it failed in the point of vivid descriptive writing, would be a failure altogether. But we have a proof to the contrary before us. *Scottish Rivers* is a delightful book, in virtue of the delightful character of the author and the delightful character of his subject. It is all about things that are in themselves agreeable. The natural heart of man is made happy by hearing that the wild cattle of Etrick Forest were *three times the size of those kept at Chillingham*; and all the more, perhaps, if we do not know what that was—there is the more rein for picturesque imagination. We should be very sorry for anyone who did not care to hear about Thomas the Rhymer and the Black Dwarf, about border-rivers, fugitive Jacobites, and hunted Covenanters. The breath of Walter Scott has gone out over these dry bones of old Scotch history; the work of imagination is done to our hand; and as we turn over these leaves, just as when we follow the actual course of the rivers themselves, we are accompanied by the pageant world of the Waverley novels, and *Marmion*, and the *Lay of the Last Minstrel*.

Moreover, there is a great deal of quotation in the book; not only Scott, but all manner of old ballads and old songs take the tale, now and again, out of the mouth of the author; and the pages are pleasantly broken up and lightened with these snatches of verse. It is the fashion, now-a-days, to run down this good old custom of quotation; we write prose so admirably, it seems, that these scraps would give even pain to the cultured reader, as an interruption to the sustained measure of the sentences. It may be so; but there is something to be said on the other side; and we greet some familiar passage when we find it in another man's book, like a friend in strange company.

The great point, however, in this book

upon Scottish Rivers, is the sincerity of the author's own delight in the stories he repeats, the verse he quotes, the scenery and the animals he seeks to describe to us. It is by this sense of enjoyment that the whole book is kept alive. Sometimes it crops out in one way, sometimes in another; sometimes it is his passion for fishing that adds gusto to what he has to say of a place—as, for example: "Below Kirkurd, the Tairth runs through a series of valuable water meadows, in a deep and uniform stream, resembling in character an English river; and," he adds, "we are much mistaken if it be not full of fine fat trouts." One can hear the smack of the lips, in these words. His whole past life has been so pleasant; he has such a host of sunny recollections, that the one jostles the other and they come tumbling forth together in a happy confusion: his basket is so full of those "fine fat trouts" of the memory, that it is a sight to see him empty it before us. Even fishing is passed by in superior ecstasies:—

"This is one of the most beautiful parts of the Tweed," he says, "and well do we remember the day when, wandering in our boyhood up hither from Melrose, we found ourselves for the first time in the midst of scenery so grand and beautiful. The rod was speedily put up, and the fly-hook was exchanged for the sketch-book. We wandered about from point to point, now and then reclining on the grass, and sometimes, from very wantonness, wading into the shallows of the dear stream; and so we passed away some hours of luxurious idleness, the pleasure of which we shall never cease to remember."

Is not that passage enough, of itself, to convince the reader? He will find the book full of the like. He will find that this man, not very wise perhaps, certainly not very cunning in words, had a great faculty of pleasureable attention and pleasureable recollection, that he had noticed things more closely than most of us, and liked them better, and that he could speak of what he thus observed and loved in a plain diffuse way that is full of gusto and most truly human.

And the last thing to be thought of, is that the book was written during the author's final illness. "What a place for linnets' nests and primroses in the lovely springtime of the year!" he exclaims, as the name of Blackford Hill comes from under his pen. Would one not fancy he was a schoolboy with forty springtimes before him? It is easy, after this, to believe what Lord Cockburn said of him, that "his dying deserves to be remembered, for it reconciles one to the act." ROBERT LOUIS STEVENSON.

History of the Modern Styles of Architecture.

By James Fergusson, D.C.L. Second Edition. (London: John Murray, 1873.)
Brick and Marble in the Middle Ages. By G. E. Street, R.A. Second Edition. (London: John Murray, 1874.)

THE reappearance of these two sumptuous works carries us back in thought a period of nearly twenty years, to a time when architecture was much less studied, and excited much less general interest, than it does at the present day. Those who remember the first publication of Mr. Fergusson's *Handbook of Architecture*, in 1855, will

hardly think it too much to say that it formed an epoch in the treatment of the subject. For some years before that time, those of the reading public who turned their attention to architecture at all mainly employed themselves with the details of English Gothic buildings, the revived taste for which was intimately connected with the prevailing ecclesiastical movement of the time. From Mr. Fergusson they learnt, not only the place that this style holds relatively to other styles, but also that the history of architecture forms a chapter, and a very important one, in the history of the development of the human mind, and that within certain limits the working of a nation's thoughts may be traced in the buildings it has produced. *The History of the Modern Styles of Architecture*, which was first published in 1862, formed a sequel to the original work, and subsequently, when the "Handbook" became the "History of Architecture," fell into its place as the third volume of the entire work. At the present time a new edition is in course of publication in four volumes, the last of which is the first to appear. The two first volumes will comprise the original work, with the exception of the part relating to India, which will be considerably amplified, and will constitute the third volume.

Mr. Fergusson is as fully alive as any of his readers can be to the fact, that the *History of the Modern Styles* is wanting in interest, as compared with what has preceded it. In studying the post-Reformation architecture we no longer have to deal with the natural outgrowth of the human intellect, but with imitations, with adaptations of other styles to purposes for which they were not intended, and with a general lowering of taste and feeling. This volume in consequence, as the author says, "becomes far more a critical essay on the history of the aberrations of the art during the last four centuries than a narrative of an inevitable sequence of events, as was the case in the previous parts of the work." Still, though it is impossible that such a subject should be treated in a thoroughly scientific manner, so that the most typical specimens have to be selected from each country, by means of which to point out the peculiarities and explain the aims of each separate nationality, yet an account of these forms of art has its value; "it is that which covers all Europe, and adorns every city of the world with its productions; and it cannot, therefore, be uninteresting to us as a psychological study, or as a manifestation of the mind of Europe during the period of its greatest cultivation and highest excitement." It is only thus that we can hope to avoid the errors of our forefathers, and possibly obtain a starting-point for better things. But besides this, these styles are intimately connected with certain periods of history. We may like or dislike the Elizabethan style in England, or that of Louis XIV. in France, but they cannot be dissociated from the spirit and the life of those eras, and in neglecting them we should be disregarding some of the materials of history. So, too, the individual buildings in many cases have a special interest, as having been the scenes of important events, or bearing on them the impress of the powerful thought of their designers. It is no slight

gain to have brought together in one volume an account of such buildings (to mention three or four out of a very long catalogue) as St. Peter's at Rome, the Certosa of Pavia, the Escorial, the Renaissance palaces on the Grand Canal at Venice, and the works of Palladio at Vicenza. Still more valuable are the descriptions of plans which have never been carried out—such as the successive designs for St. Peter's, Wren's original design for St. Paul's, and that of Inigo Jones for the Palace at Whitehall.

Mr. Street's book, which is in all respects a great contrast to that of Mr. Fergusson, originally appeared in the same year as the *Handbook of Architecture*, and some of its plates were laid under contribution for that work. There is no need to say that Mr. Street is deeply versed in Gothic lore, and an enthusiastic advocate of the merits of that style. His description of the Gothic buildings of North Italy, like that of his corresponding book on Spain, is pleasantly thrown into the form of a narrative of his journeys, and in his illustrations he has wisely confined himself for the most part to buildings which have not been delineated elsewhere. The ground which this volume traverses is comparatively well known, and in this respect it cannot be compared with the *Gothic Architecture in Spain*, which in many ways was a revelation, and which, notwithstanding its costliness, and the minuteness of its architectural detail, long ago reached a second edition. But in the company of an accomplished artist like Mr. Street, we are certain to have our attention drawn to the features which are most worthy of notice, and many of which might otherwise have escaped us; while an additional interest is afforded by the use of brick and marble as materials in the architecture of North Italy being made a special object of study.

In both the works now before us reference is made to the question, what will be the future of architecture in England? It is much to be regretted that Mr. Fergusson should indulge in such frequent and unqualified denunciations of the styles of building of the present day, and especially of the modern Gothic, by which great weariness is excited in the minds of his readers, and the interests of his favourite study are not advanced. It is surely an exaggeration to say of the prevailing ecclesiastical edifices, that "though Gothic in outward appearance, they are erected in utter defiance of every principle of Gothic art," and that they are merely the products of slavish imitation. It might seem to be almost in answer to this last objection that Mr. Street says, when speaking of the advantage to English art which may be obtained by the study of foreign styles:—

"It is quite possible, and one wishes above everything to see it usual, for architects to design all their work without special reference to, or really copying from, any old work. But, before doing this, they ought at least to put themselves in the same position as to knowledge of what had been done before as that in which their forefathers were."

We quite agree with Mr. Fergusson that it would be far better to create a style which should express the ideas and meet the wants of the present age than to follow the lines

indicated by ancient tracks; but if we were to go in quest of such a style, we certainly should not find it in the eclectic style proposed by Mr. Fergusson, a mixture of classical and Gothic art on which he would bestow the name of the common-sense style. It would be far better, in our opinion, to go back for our starting-point to Byzantine architecture, the style of the round arch and the dome, which has spread its prolific influence over three continents, and has succeeded in producing a far greater number of styles than any other form of architecture. It is true that here Mr. Street would join issue with us, for he believes, on the one hand, that the pointed arch affords greater facilities for construction, and, on the other, that the Italian buildings prove that, as a rule, the mixture of the round and pointed arch is neither harmonious nor satisfactory. But, however this may be, we greatly doubt the wisdom of following Mr. Fergusson's advice, that our architects should cast off all their present trammels, and feel their way boldly onwards in full confidence of a successful issue. Even supposing that we do not live too late in the world's history for new courses to be open to us, the periods which have given birth to fresh styles of architecture have usually been marked by a unity of idea or purpose; and it is difficult to see where such a unity would be found at the present day, except perhaps in matters purely utilitarian. It can hardly be well to burn our bridges behind us until we have learnt at least something of the country that lies in our front.

H. F. TOZER.

The Conqueror and his Companions. By J. R. Planché, Somerset Herald. In Two Volumes. (London: Tinsley Brothers, 1874.)

THESE volumes contain much that is interesting and valuable, but as a whole they are disappointing. The subject is one that hardly admits of popular treatment even in the hands of so genial an antiquary as Mr. Planché. The names, origin, and personal history of those who "came over with the Conqueror," are involved in such endless difficulties, that notices of them must chiefly take the form of minute archaeological criticism, than which nothing is less likely to commend itself to the taste of the ordinary reader. Mr. Planché, therefore, as we venture to think, loses more than he gains by his efforts to popularise his work. The general public will, after all, probably regard it as too dry; and at the same time the genealogical and historical student will certainly condemn it as too unscientific.

Considering the questionable authenticity, to say nothing of the length, of the Battle Abbey Roll, and the various lists of the invaders compiled by modern antiquaries, Mr. Planché wisely confines himself "to those personages who are recorded by contemporary or nearly contemporary writers, as having been present in the Norman host at Hastings, or at least conspicuous in England during the four years immediately following." He takes, therefore, the *Roman de Rou* as his foundation, and gives all the information, biographical or genealogical, that he has been able to scrape together

relating to the hundred and eighteen followers of William named or indicated by Wace. Unfortunately, in too many cases he has "abstained from encumbering" his pages "with unnecessary notes and references." Not only, therefore, do the real labour and research which the work must have involved run the risk of not being appreciated as they deserve, but the work itself loses considerably in value. It is true that "the antiquary will know whence the general information is derived;" but such knowledge is of very little practical use for testing the author's statements in the absence of an exact reference to his authorities.

The notice of the Conqueror himself is naturally the most generally interesting. William's own history and that of his family supply the author at the outset with plenty of material for the exercise of his critical faculty, and on the whole the questions at issue are well handled. One traditional belief is attacked by the novel suggestion that Herleva's father was not a tanner after all, but a furrier, as shown by both the Latin and French terms by which his trade is designated. In this we are more ready to follow Mr. Planché than when he says that "he should not be surprised" if the mysterious Matilda "*filia Regis*" of Domesday should prove to be an illegitimate child of the Conqueror. The supposition is impossible in the face of the fact that in the two documents, besides Domesday, in which alone her name occurs, she is called a daughter of Queen Matilda. Elsewhere, also, Mr. Planché's eagerness to take away William's character for what he calls "immaculate morality," leads him to a hasty conclusion, when he fathers upon him no less a personage than Thomas of Bayeux, Archbishop of York. His only evidence is a charter of the King, printed by Uredius from an original in the archives of St. Peter's, at Ghent, in which we find among the witnesses "*Ego Thomas Archiepiscopus Regis filius.*" This is startling enough, and is regarded by Mr. Planché as a convincing proof of William's profligacy. Granting even that the charter is a genuine one, others will more easily believe that after "*Archiepiscopus*" the words "*ego Robertus*" have been dropped in printing, the name of William, "*Regis filius,*" occurring lower down. That this is the case is proved by Uredius himself. Besides the charter in question, two others are printed on the same page, one only of which is witnessed by Robert. When, therefore, we read at the bottom of the page "*Robertus subscribit duobus patris sui G. diplomatis supra hac pagina,*" the obvious inference is as above suggested. Mr. Planché indeed says that Thomas is styled *Regis Filius in presence of Robert*, apparently supposing another witness, "*Robertus comes,*" to be the King's son, whereas he is plainly his half-brother Robert, Count of Mortain. He also points to the sudden elevation of Thomas to the northern primacy, as being in itself suspicious. But the treasurer of Bayeux and royal chaplain was not the obscure man that Mr. Planché represents him. His learning, abilities, and high character might well have recommended him for promotion to an ecclesiastical reformer like William, without the

necessity of supposing a relationship between them. After this, it is a matter of course that Mr. Planché should believe the better-known, although not better authenticated, scandal about William Peverel. So strongly, indeed, does he feel upon the subject, that he is amusingly indignant with Mr. Freeman for regarding the second-hand authority upon which the story is based as insufficient. His idea that Peverel is the Norman equivalent of Puerulus, and that William Peverel, as son of Duke William, was so called to distinguish him from his father, is ingenious; but one objection to it is that the name was borne by Ranulph Peverel, who was either William's half-brother or his mother's husband. It is credible, of course, that the name, personal in the first instance, might have become the family name of William's descendants; but it is hard to see how it could have attached to his contemporary relations. In all other respects Mr. Planché takes the most unfavourable view of the Conqueror's character. He denies him the possession of a single virtue, sneers at his religion, ridicules the idea of his "conjugal felicity," and is generally ready to believe him guilty, or capable, of any crime laid to his charge. The poisoning of Walter of Mantes and Biota, his wife, for example, he assumes as a fact, and uses it as an argument to justify the rebellion of Ralph of Wader, Earl of Norfolk. Mr. Freeman, it will be remembered, relying on the statement of the Saxon Chronicle that Ralph was son, by a Breton mother, of an Englishman, also named Ralph, and a native of Norfolk, stigmatises him as the "only English traitor" in the Norman army, and identifies his father as Ralph the Staller of King Edward. Mr. Planché, on the contrary, argues that he was son of the well-known Ralph, Earl of Hereford, son of Goda, sister of the Confessor, by her first husband, Drogo of Mantes. The English blood would then be on the mother's side, for the elder Ralph's wife was, we are told, an Englishwoman. How their son, however, could be a Breton, as he certainly was, one way or the other, is not so clear, since Mr. Planché does not inform us how the father was of Breton descent. He appeals, however, to the circumstance that the murder of Walter and Biota was one of the crimes alleged against the King by the conspirators at the famous "bride ale" at Exning, as corroborating his theory, according to which the murdered man, as son of Drogo, was Ralph of Norfolk's uncle. This fact, it is urged, makes the charge as coming from him peculiarly appropriate, and supplies an intelligible motive for his treason. The charge, however, is but one, and not the most prominent, of those that are specified; while, as for "the base assassination of his nearest kinsmen" having anything to do with Ralph's revolt, it is sufficient to remark that ten years had elapsed since the murder, if murder there was, during which he had been an active partisan of the supposed murderer, fighting by his side at Senlac, and participating in the titles and rewards which he dealt out to his favoured adherents.

The above may serve as a sample of the kind of questions with which these volumes largely deal. Further we are unable to

carry our examination, for Mr. Planché's arguments involve so much detail, that it would be impossible, within our limits, to do them justice. Suffice it to say that, in the majority of cases, they are clearly and—subject to a lurking doubt as to the author's authorities—satisfactorily worked out; while the more strictly biographical part of the work is familiarly and pleasantly written. Independently, however, of the want of references, there are defects which are too serious to be passed over. The book has been passed through the press with scandalous haste and carelessness. More slovenly grammar never, we should think, appeared in print. One sentence especially, beginning at the bottom of page 36 of vol. i., we are strongly tempted to quote as a literary curiosity. If the English is bad, the Latin is worse. Of the numerous quotations the majority are ludicrously incorrect, not the least so that from Uredius (who, by the way, is for some reason called by his Christian name alone), which expressly claims to be given *verbatim et literatim*. Inaccuracies of every other kind are also to be found. In the references he does give, Mr. Planché contrives to blunder. There is no Cotton charter 52 A. 15 (it should be *Harleian*), and there is no work with the curious title *Researches sur le Domesday*. We have, too, Edith Forne represented as the mother, by Henry I., of Robert Earl of Gloucester (vol. ii., p. 218); the same son of Richard de Courci variously called Robert and Richard (pp. 78, 86); besiegers confounded with besieged (p. 80); and William Malet apparently fighting on the side of the English at Senlac (p. 95). So at least we interpret the passage, where, after explaining the term "*compater Herald*," applied to him by the author of the *Carmen de Bello*, as meaning "joint sponsor with Harold," Mr. Planché proceeds: "It would be interesting to discover whose child they stood godfathers to, and why we find him in the ranks of his fellow-gossip." Such instances of negligence—and they might easily be multiplied—would be bad enough in any case; but they are doubly reprehensible where the author at once destroys the reader's confidence in his accuracy, and by not always distinctly citing his authorities renders it difficult for him to test it.

=====

Voyage en Asie. Par Théodore Duret. (Paris: Michel Lévy Frères, 1874.)

CONSIDERING that M. Duret's tour in Asia only occupied fourteen months altogether, he made good use of his time, for in that short period he visited the principal places in Japan, China (including a trip into Mongolia), Java, Ceylon, and India. He warns his readers at the outset that they must not expect to find in his book "*des aventures romanesques et des récits merveilleux,*" and we are bound to say that he keeps his promise, for his chapters are mostly short and to the point.

M. Duret spent rather more than half his time in Japan and China. He reached the former country *via* San Francisco, and landing at Yokohama he proceeded at once to Yedo, and then paid brief visits to Kioto

and Osaka. From the latter place he crossed to Shanghai, passing on his way through the famous Inland Sea, of which—true to his promise to avoid speaking of things described by previous travellers—he merely says that it is “toute bordée de magnifiques montagnes.” The vast volume of the Yang-tsze kiang naturally made an impression on him, though we are not surprised to hear that he did not admire its muddy waters, which discolour the sea for about sixty miles from its mouth. After a very brief stay at Shanghai, M. Duret made an excursion up the Great River as far as Hankow, and on his return journey he visited Nanking, Chin-kiang, at the junction of the Grand Canal with the river Yang-tsze, and Yangchow, of which Marco Polo was governor for three years. These cities suffered very severely at the hands of the Taiping rebels, and it will be many years before they wholly regain their ancient prosperity; Nanking most probably never will do so. M. Duret next went to Peking, where, as at Yedo, he paid some attention to the collection of bronzes, &c., and the study of the political and social condition of the Chinese and their governmental and literary institutions. Before quitting the south of China he indulges in some sarcastic remarks at the expense of British merchants. In speaking of the coolie trade, he says:—

“This traffic in human flesh is only carried on at Macao*; at Hongkong it is forbidden. But if the English have been scrupulous about engaging in the exportation of the Chinese, they have never been in the least degree scrupulous about poisoning them by the importation of opium, and even going so far as to make war on them in order to force the poison on them!”

M. Duret might study recent commercial reports with advantage, as he would thereby learn something about native opium, for which *perfidie Albion* can hardly be held responsible.

From China M. Duret went to Java and thence to Ceylon, and after exploring that lovely island, he crossed over to India and worked his way up the east coast to Calcutta, journeying partly by land and partly by sea. Leaving the City of Palaces by rail, which must have been a pleasant change from the *charrettes aux bœufs*, he visited Benares, Agra, Delhi, Lahore, &c., and finally reached Bombay towards the close of December, 1872. As it is but rarely that we hear anything at all about Pondicherry, we think that, of this portion of his book, the few words which M. Duret says about his visit to the “French possessions in India” will be read with the most interest. One thing, of course, is certain, “c’est que les indigènes des parcelles territoriales restées à la France préfèrent la domination française à celle que les Anglais exercent sur le reste du territoire.” The reason of this, he says, is simple: they are taxed less and left more to themselves. With regard to the town of Pondicherry, he remarks: “Elle a eu autrefois de grandes espérances, qui ne se sont point réalisées. Aujourd’hui on y végète honorablement en souvenir du passé, mais sans aucune espèce d’avenir.”

NEW NOVELS.

Young Brown. By the Author of “The Member for Paris.” (London: Smith & Elder, 1874.)

Uncle John. By E. J. Whyte-Melville. (London: Chapman & Hall, 1874.)

My Time and what I’ve done with it. By F. Burnand. (London: Macmillan & Co., 1874.)

It is recorded of Mr. Pickwick that he took another glass of punch, to see whether there were orange peel in it, because orange peel always disagreed with him. On much the same principles we have read *Young Brown* again, after perusing it in the *Cornhill Magazine*, because the author says in his preface that the work has been accused of impropriety. Thus warned, we studied *Young Brown* with considerable attention. But the impropriety escaped us, either because to the pure all things are pure, or because it is altogether too recondite, or because it only exists in the fancy of rapid critics. Madge, we hasten to assure the timid reader, was only the Duke’s cousin, nothing more. Anyone could find that out who read to the end. There is nothing here to recall the works of M. Belot, nor of M. Feydeau, of whom the author speaks with proper horror. He does not mean to be improper, he says, and he “does not hold up any individual, living or dead, to shame.” Neither scurrilous nor indelicate, the author of *Young Brown* has written a novel “to call attention to certain crying evils in our laws of inheritance.” Some people have called the novel a great book, he says, but its greatness has escaped us. Perhaps the moral earnestness might have been a trifle obscure too, if the writer had not taken the world into his confidence about it. He has hoped, “if not to frighten the wicked, at least to console the good, by the assurance that evil, though now and then outwardly triumphant, is never blessed, and that the practice of virtue is not so sterile as it seems.” Considerable accessions to the ranks of probity may be looked for now that the author of *Young Brown* has determined, in the language of the Presbyterian liturgy, to be “a terror unto evil doers and a praise and protection unto all such as do well.” Evil doers, it seems, abound in the peerage. The felonious dukes of this story are clearly no mere fiction. We have encountered many such in the pages of penny numbers. The writer of *Young Brown*, too, tells us that dukes are not what a vain people supposes. Like Thackeray’s bargee, he “likes wopping a lord.” If lords and other malefactors are not frightened by *Young Brown* they must, indeed, be bold bad men. For pray consider the results of wickedness in high places.

The first Duke of Courthope and Revel—he always went by that double-barrelled title—was a nobleman in whose family it was hereditary to be illegitimate and to have illegitimate heirs. Fulfilling the weird, so to speak, of his beautiful but fated race, he early involved himself in a Scotch marriage with Miss Margaret Brown. Getting rather bored with Miss Brown, he left her in Italy to console herself with the affection of her baby, a girl. The Duke himself returned to

England and wedded Lady Mary Overlaw. Meanwhile the unfortunate Miss Brown came back to our shores, and died at Wakefield in the Marsh, leaving her child, Madge, to be barmaid at the Chequers Inn there. Madge was no common girl: she had “purple eyes,” and perhaps in consequence, could not read or write—so that her mother’s marriage “lines” afforded her no information. The simple villagers knew her as Madge Giles. Now the duke died, and his reputed son, coming by chance to Wakefield, seduced Madge. But it must be remembered that he was not the son of his father, so to speak, but of his uncle, and the first duke we have to do with here, made out that he was his own progeny for family reasons. This new duke was a colossal swindler and scoundrel, with a falsetto voice and manners which the writer of the story thinks truly noble. He was not a good man, but he was true to the tradition of his house, and married a Lady Helena Cardwell, while his real wife, Zephyrine Malvoisin, was still alive. He had three sons, Young Brown, by Miss Giles, and the Marquis of Kingsgear, by Lady Helena, and one Malvoisin, by young Zephyrine. Malvoisin stabbed the Marquis of Kingsgear in a battle in India. Young Brown married the real heiress of most of the Duke’s titles and possessions. And the Duke himself dragged out a dishonoured life, raising money which he did not want from Mr. Sharp, a Yorkshire usurer. Obviously this is much more than an ordinary novel. The odd thing about it, is the real wit and keen observation with which such a queer story is told. If the class of permanent secretaries are really shamefully corrupt and indolent, and if they are also thin-skinned, they must quail beneath the pen which has branded them as Bodgers. Very likely there is more in the word Bodger than meets the eye. If not, perhaps the permanent secretaries may recover from the taunt. The idle will be amused by *Young Brown*, whether the wicked are frightened, and the good consoled, or not. Perhaps they will be sorry that the powers of the author of *The Member for Paris* have not been employed on some more pleasing subject. But they must regret that he has not illustrated his book with a genealogical tree, that they might know in what relations the characters stood to each other; also in what relations they *thought* they stood to each other, and what views the outer world held on the same questions.

No novelist is more readable and less fatiguing than Mr. Whyte-Melville. His books have the dash, the colour, the rapid execution and open-air effects of Sir John Gilbert’s drawings. Perhaps no one writes better on sporting matters. His runs are not too good, his fences are not too high, nor his salmon too heavy. None of his heroes pitch heavy welchers into ponds, nor drink pine-apple ice in curaçoa and soda-water at four in the morning, nor break the bank with a cold smile on their iron lips, nor play with the hearts of duchesses and flower girls, like many heroes whose acquaintance lady novelists thrust on us. His men are honest handsome gentlemen, “not clever.” In reading of their exploits one feels how nice it would be “to leap lightly down, and take the curb off a hard-mouthed

* It was abolished there on March 27 last.

one," and afterwards "clear a flight of rails out of the next enclosure." So infectious is Mr. Whyte-Melville's love of sport that the reader is almost enabled, by mere sympathy, to guess what is meant by saying that a hound "is but one degree removed from the enormity of skirting." He can share the day dreams of young Perigord as he indulges "the thoughts of a boy, which are long, long thoughts," after getting a big score at cricket. He can even enter into the feelings of Mrs. de Laney as she burns the photographs of her admirers. But he can't understand how that lady should be a model of all the virtues after having lived for many years as the wife and accomplice of a gambler. Nor can he believe, even though he try very hard, that the sharper was really drowned in that shipwreck, which seemed to leave his wife free to marry the curate. He knows that she too, like all the gallant gentlemen of the story, has "a past" buried somewhere, and that the past is a vampire, which will leave its grave and give her some annoyance. After all, this clear precision of the plot does the book very little harm. Annie Dennison making charity a safety valve for her own wounded feelings, is very nice and natural. What would the poor do if the course of true love in the upper classes always ran smooth? Miss Dennison is a charming young lady whom the nineteenth century in passing by has just touched with the skirts of its garments. She is not quite so single-minded as Miss Austen's girls, but very nearly. And Uncle John, the brave, hen-pecked old warrior and sportsman, is one of the finest characters in later English fiction. Had Colonel Newcome never suffered from Mrs. Mackenzie, and never died in the Charterhouse, the life and death of Uncle John would be an original masterpiece. *Uncle John* is a novel that can be recommended with entire confidence to readers who do not care to be fatigued with a complicated plot, or with illustrations drawn from heaven and earth and the works of Mr. Herbert Spencer. It is a series of happy sketches of common things and characters, and is not without a certain pathos, which may succeed where more elaborate moralising fails.

Some persons think it would be a good thing if every distinguished man were once in his life to write a novel. Much light would be thrown into unexpected places, and autobiographies would almost be superseded. A theological fiction from the pen of Mr. Gladstone could not but attract, and some excitement would be caused by the announcement that Messrs. Lowe and Ayrton were working together, like MM. Erckmann-Chatrian. A novel by Mr. Ruskin would be welcomed. A romance from Mr. Herbert Spencer would have many readers. But perhaps the public would be satisfied with one, only one fiction, by writers eminent in other branches of literature. And one is all that they are likely to wish from Mr. Burnand. Mr. Burnand has caused as much helpless and hysterical laughter as any humourist of the time. *Happy Thoughts* is a possession for ever; but *My Time and what I've done with it* is not a readable story. The humour is rare, though the attempts at it are unceasing. The relations of Mr. Piggy to his brother, Mr. Fatty Bifford, are amaz-

ing. That is nearly the best that can be said for this book, where the plot is absurd, and the details forced and dreary, and the characters lifeless. One is grateful to Mr. Burnand for only telling us what he did with the time of his youth. A. LANG.

CURRENT THEOLOGY.

Words of Hope from the Pulpit of the Temple Church. By C. J. Vaughan, D.D., Master of the Temple, and Chaplain in Ordinary to the Queen. (London: Henry S. King & Co.) *Forget Thine Own People, a Plea for Missions.* By C. J. Vaughan, D.D. (London: Henry S. King & Co.) Dr. Vaughan is, as times go, a great preacher; and yet these volumes suggest a reason why the pulpit is not a considerable power in our generation. Newman, Maurice, and even Robertson did something to guide or influence the thought of the preceding one; they were able to influence it, because they understood it. Newman warned the spirit of the age against itself, the others reconciled it to itself; but the secret of the success of each was that they knew, not only what men thought and felt, but where their thoughts and feelings were uneasy and out of harmony with one another. Preachers like Dr. Vaughan or Dr. Liddon—while they conscientiously observe what thoughts and feelings are dominant—while they extend a generous sympathy to the better elements they acknowledge in the dominant temper—fail in this subtler insight: they do not discern how men's thoughts and feelings appear to those experiencing them: they can only judge them *ab extra*, trusting that their judgment, if just, will commend itself to all candid minds, even theirs who are affected by it. And if it be just, as perhaps it is, it will commend itself to all candid judges who try the question in the same court; to those who accept the preacher's first principles, his reasons may appear convincing, as well as his conclusions true. But "if one unlearned or unbelieving come in," the only way to convince him and judge him is to make manifest the secrets of his heart: if the preacher fail to do this, he will speak to the air. The hearer will not say that he is mad; but instead of being persuaded by him "that there are yet words for God," he will charge him with speaking deceitfully for God, or accepting His person.

It would be superfluous to say that Dr. Vaughan does not really deserve this charge, or to testify to his wide sympathies, his manly intellectual honesty, or the high practical morality of his teaching: not to speak of the more superficial merit of refined taste and impressive language. And it would scarcely be fair to charge him with ignorance of human nature: a man of his experience and his good sense could scarcely have failed to learn the most frequent phenomena of the conscience and the intellect, and their commonest relations to one another. But something more than wide experience and good sense is needed, before it can safely be assumed that what is frequent is universal: a single exception may avail, not only to refute a rash generalisation, but to demolish a whole system deduced from it. At any rate, you cannot arouse a man's antagonism to your entreaties more surely than by asserting that they find in him a response which he is conscious that they do not. Whether a sermon aim at conversion or edification, inaccurate experimental statements are fatal to efficacy; and in the parts of *Words of Hope* (not, by the way, a very appropriate title) that are directed to each, there are some statements that seem at best rashly generalised—some that not every believer would acknowledge, and more that no unbeliever could be expected to concede.

In the first place, Dr. Vaughan seems to adopt the Methodist view as to the necessary course of the spiritual life. He does not, of course, put forward—indeed he repudiates—the coarse doc-

trine of sensible and instantaneous conversion; but he unmistakably teaches that conversion or awakening is universally needed; and he seems also to teach that its beginning must be in conviction of sin. Does this theory make due allowance for the life—surely sometimes realised—of "days bound each to each by natural piety"? a life wherein there may be spiritual changes, possibly even sudden ones; but these are all of the nature rather of illumination than conversion—the soul finds herself overtaken by the goodness she has always been pursuing, embraced at last by a love whose mutual hold she has felt from before the dawn of memory.

Still, the believer is not unlikely to let a doubtful statement pass, if edifying, though Dr. Vaughan would scorn to take advantage of the fact; but the doubter or the indifferent will be more critical. The following statements are made for their benefit, and they are the proper witnesses to their truth or falsehood: what will their testimony be?

"I believe that earth itself does homage only to dead saints. I know, indeed, that they (sic) will recount the parliamentary successes, the military triumphs, of men who laughed in their lifetime at Christianity. This is the office of history. History must keep these men's names and dates and parentages and posterities. But I venture to believe that history herself keeps them on a different page and in a different category. We have known men—entirely cut off, themselves, from the moorings of the Gospel—who have desired nothing more than that their wives should teach their sons and their daughters the faith as well as the morals of the Gospel. . . . They know in their heart and in their soul that they would give their right hand, or their right eye, to be again as they were in childhood. No men are more inquisitive about death-beds than men who are themselves unbelievers. None more eager to know the last words—to know whether they breathed anything of Gospel trust and Gospel hope."
